Announcement of the issuing of a Turkish loan of $30,000,000, draws attention afresh to the extraordinary changes which the past year has wrought in the historic idea of the European equilibrium. The intention of this putting of the Turkish Treasury in funds is to enable the new régime to consolidate its power. Old debts are to be paid off, indemnities taken care of, the current budget made to balance, and the various departments of government reorganized. This of itself is sufficiently novel, but the really striking aspect of the matter is the emergence of financial Turkey from her old tutelage. We are told no more of a Concert of Powers dictating the terms of the loan and presiding over the details of its administration. There is not even the rush of different nations to force money upon Turkey, as upon China, in order to obtain an equitable lien upon the national property. It is but one sign more of the break-up of the century-long theory of the balance of power in Europe—what Kinglake called the "Usage."

Bismarck once said that the problem of the Near East had an awkward habit of becoming acute at intervals of about twenty-one years. The Crimean war in the 50s was followed by the great Balkan explosion which ended in the Berlin Congress of 1878. But since then the unsettled question has disturbed the repose of nations at shorter periods. There has been no violent outbreak of hostilities, except the abortive war between Greece and Turkey, but the unrest in the Balkan states has been chronic, massacres in Armenia and Macedonia have not permitted European diplomacy to sleep, one "programme" after another has been adopted, like that of Mürzsteg in 1903, only to fail of enforcement, and then came the events of 1908 to make a complete finish of the old *status quo*. The doctrine to which the statesmen of Europe have outwardly subscribed for two generations is now an empty form. A moral revolution has swept its substance away. No radical change in territorial alignment has been brought about, except the annexation of Bosnia-Herzegovina by the Austrian Empire—and that was little more than the recognition of an accomplished fact—but the entire atmosphere is different. The Chancellors and Foreign Secretaries of an earlier day would not know how to breathe in the new air which envelops European diplomacy, to-day, in the presence of the questions of the Near East.

The man to whom the historians will doubtless give the credit, or discredit, of precipitating the new order of things is the Austrian Minister, Baron von Achrenthal. His cool announcement last October, that Austria would thereafter regard Bosnia and Herzegovina as her own territory, really sounded the death-knell of the Concert of Europe, as formerly understood and observed. Preceded, as this was, only two days before, by Bulgaria's declaration of independence, it gave a shock to the old arrangements from which recovery has since been impossible. All the king's horses and all the king's men cannot put Humpty Dumpty back again. Baron von Aehrenthal's audacity has been crowned by the event. The outbursts of protest which it at once provoked have died away. England took firm ground, and held a high tone. There had been a breach of the Treaty of Berlin, and the guardians of the public law of Europe could not allow it to be sanctioned. Sir Edward Grey put this before Parliament and before the Cabinets of the Powers in the most emphatic way. At the very least, there must be another international conference to pass upon the bold initiative of Austria, and, if her act was not repudiated and disallowed, to make the usual "compensation" to the other Powers. There were the most confident predictions of a Congress of Europe to be held this past summer. Plans had gone so far that place and time and agenda had been discussed. But nothing has come of it all. The talk of a congress has faded out. Germany's firm backing of Austria, together with what was practically her ultimatum to Russia, made it certain that Austria's position at any meeting of the Powers would be unassailable. So the whole scheme appears to have been dropped indefinitely. But the work had been done. Old things had passed away in Europe, even if all things had not become new. As a well-informed writer in the London *Times* puts it:

> The restoration of the Turkish Constitution, the proclamation of Bulgarian independence, the annexation of Bosnia-Herzegovina, the dethronement of Abdul Hamid, and the withdrawal of the international contingents from Crete, mark the close of the period that began with the Berlin treaty, and state in altered terms the problem of the Near East.

The necessary readjustments will take time and patience. Baron von Aehrenthal has been acclaimed as the new Bismarck. He is at least like that statesman in displaying moderation after a great triumph. Holding fast to what he has won, the Austrian Minister has been prudent and conciliatory in meeting the new situation. From anything like a war policy, he has shrunk, being confirmed in that course, doubtless, by the aged Emperor Francis Joseph, who has had bitter experience of the truth that any war may easily prove a blunder and calamity, both politically and financially. But there is no denying that Germany and Austria have become the centre of diplomatic interest in all that relates to the Eastern question. That again is proof of the remarkable change which has come over the face of European politics. It may not be necessary to speak of rolling up the map of Europe, but though territorial possessions and names may long remain unchanged, the moral dislocation of the great Usage is undoubted.

A NOTABLE QUINQUENNIUM.

Five years, almost to a day, before Peary came out of the Arctic wilderness and began the now famous Battle of the Explorers, another battle was fought and finished on the other side of the world. It was actual conflict. Japan had just beaten the Russian army at Liao-Yang in the first pitched battle of a war whose vast historical consequences we have not yet fully realized. Between two such surprisingly dramatic events as the triumph of Asia over Europe and the discovery of the North Pole, lies a short stretch of years packed close with notable achievements. The balancing of age against age and century against century, is rather a profitless occupation, recalling the favorite topic of debate on backwoods platforms, "Resolved, that Greece did more for civilization than Rome." There are some who, like Professor Walsh, believe that the age of faith, which many of us call the Dark Ages, marked the apex of human attainment. The thirteenth century is to that authority the "greatest of centuries," and he has written a book to prove it. Others have plumped for the eighteenth century because it contained in itself the seed of which the nineteenth witnessed the fruition. But this

doctrine of the seed may lead one too far away. It has led Dr. Walsh back into the Middle Ages; it might take us to the time of all beginnings.

But reduce the comparison to five-year periods, and the game grows more absorbing. A half-decade largely excludes movements, tendencies, and seeds, and deals with a certain number of concrete facts, which are easy enough to compare. Or, if origins and causes are eligible for the contest, these cannot be so many in number or so badly intertangled as not to be amenable to comparative treatment. There are not many five-year periods that begin sharply and yet yield transcendent historical events. The first that suggests itself is the five years of French history from 1789 to 1794. This calls up immediately the five years of American history from 1776 to 1781. And so we may go on pushing back our quinquennial indicator like the slide on a vernier, till it covers a significant period or single significant event—1688 in England, 1588 in England, 1492, Charlemagne's crowning in 800, the five years after the battle of Actium, the five years from the crossing of the Rubicon to the tragedy at the base of Pompey's statue, or the five years after Salamis. The present is at heart usually a humble age. For all its loud complacencies, the passing day is always deferential to the past, and awed before the future. Even the most hardened of spread-eagle orators will hesitate to assert that the years 1904-1909 will mean more in the history of civilization than the age of the discovery of America, or the age of American liberation, or the age that witnessed the death of feudal Europe.

And yet what a magnificent record of progress is included between the February day of five years ago, when the Japanese torpedo-boats threw themselves at the Port Arthur fleet, and the February day when Peary set out on his final dash for the Pole. The political and social results of the great war in the East have not yet been fully reaped. But already we can enumerate the admission of Japan into the family of great Powers, the establishment of constitutional government in Russia, a Constitution in Persia, a Constitution in Turkey, the promise of a Constitution in China, and the beginnings of self-government for India. In other words, within five years nine hundred million souls have taken a highly critical step forward in their political evolution. The complacency of Christendom received a setback when, after pagan Japan, Mohammedan Turkey and Persia demonstrated the compatibility between a non-Christian faith and political progress. On a somewhat lower plane of importance, we have the introduction of universal suffrage in Austria and in Sweden; the dissolution of a partnership nearly a century old between Sweden and Norway, and of a still older partnership, between the Church and the State, in France; the appearance of the British Labor party in Parliament, with important consequent changes in the British government system; the introduction of woman's suffrage in Finland. In the birth of a great British commonwealth in South Africa we touch once more on a matter of capital importance.

And then, of course, there is Science's record. The discovery of the North Pole may be of no prime scientific value, but simply as the successful conclusion of a three hundred years' effort, the event is enough to signalize its age. It is only two years since land first spoke to land across the Atlantic without visible medium, but already we are habituated to the miracle of the wireless. The "conquest of the air" is still fresh to us, but how much longer it will remain so we dare not predict. If it comes to balancing results, who shall say that the beginning of human flight will bring less important consequences to civilization than the establishment of the American republic, or the birth of European democracy? At bottom, we repeat, the present is always humble towards the past and the future. But who shall begrudge a little outburst of vanity now and then to an age that can count, within the space of an infant's life, conquests so great and changes so immeasurable?

THE TARIFF COMMISSION.

The appointments to the new tariff commission, made public on Saturday, are of a sort to argue that President Taft and Secretary MacVeagh mean business. They would not have sought the services of such men, unless they had intended the work to be worth while; nor could they have secured them for a merely ornamental or dead-and-alive function. Prof. H. C. Emery of Yale, named as chairman, is an economist of recognized training and acuteness. He has kept his scientific knowledge closely in touch with actual affairs. With him will be associated Mr. Reynolds—not the great Reynolds, but an Assistant Secretary of the Treasury—and Mr. Sanders of Chicago, who represents the practical agricultural interests of the West. Thus we have a board, or commission, or whatever it is to be called, which has at once a good balance and promise of efficiency.

There has been a vast amount of words regarding the scope of this commission's activities. It is well known that the full plan for a scientific tariff commission did not find favor with Congress. Speaker Cannon would have none of it. To his lofty mind, it was abhorrent to think of a body of experts inquiring into the exact facts regarding cost of production in this country, and discovering the needlessness of given tariff rates, except to make profits inordinate. Even the truncated form of a provision for a tariff commission, reported in the Aldrich bill, was further cut down in conference between the two houses. As the President's authority stands in the law enacted, it reads thus:

> To secure information to assist the President in the discharge of the duties imposed upon him by this section, and the officers of the government in the administration of the customs laws, the President is hereby authorized to employ such persons as may be required.

Now, "this section," of course, was section 2 of the Payne-Aldrich bill, dealing with the maximum and minimum tariff, and with reprisals against foreign countries. Senator Hale openly contended in the Senate that it tied the President's hands, and prevented him from investigating, in an independent and thorough way, the domestic workings of any tariff schedule. On the other hand, Senator Aldrich maintained that the clause, as accepted at last, gave the President ample power. Mr. Taft himself declared, at the time, that he was satisfied with the outcome, since the language of the law, when "properly construed," would admit of all the inquiries that were contemplated under the original scheme of a tariff commission. That the President is still of that mind, was shown on Saturday at Beverly, when he said that he did not care what the new body was called, so long

as it was fitted to do the desired work. Moreover, the official statement proves that the Administration does not feel itself bound by Senator Hale's narrow interpretation. It runs:

> The President and the Secretary of the Treasury have agreed upon the plan that these three gentlemen are to constitute the board, and are to be given authority to employ such special experts as may be needed in the investigation of the foreign and *domestic* tariff.

In the nature of the case, it could not be otherwise. The whole tenor of section 2 is to the effect that the President must be "satisfied" that foreign countries are discriminating against us in the matter of customs duties, or that the operation of their tariff laws is not "reciprocal and equivalent," as compared with our own. This opens the whole question. No construction of the law can be so strict as to debar the President from trying to ascertain the full facts. The information he gets may not all of it be relevant exclusively to the subject of the maximum and minimum tariff, but is there any way of keeping him from making such use of it as he sees fit? It is his Constitutional duty to make recommendations to Congress from time to time. The more knowledge he has upon which to base such recommendations, the better; and also, we may add, the more imperative his obligation to press upon Congress the measures he believes to be for the good of the country.

We shall doubtless very soon get an earnest of President Taft's intentions, or hopes. At least when he comes to address the people of the West, so dissatisfied with the outcome of his efforts to get the tariff revised, he will take us into his confidence. Two things are certain: one is that in his tariff commission the President has a potent instrument for influencing public opinion and Congress; the other is that if Mr. Taft, having put his hand to the plough, should now look back, he not only would seriously damage his own reputation, but would blight the hopes of his friends and of the great majority of the people.

HARRIMAN AND HIS TIME.

Upon the personal side of the late E. H. Harriman, the tragic nature of his end would alone forbid us to dwell. Pale death knocking with equal foot at the door of his unfinished palace, and turning what was to be a resting-place for his old age into a scene of eternal rest, sufficiently presses home the moral of the vanity of human wishes. Even enmity would be silent before such a stroke of fate. Nor shall we stop to discuss the nature of that undoubted ability which made Mr. Harriman the great power he was in the railway and financial world. Such impressive results as he wrought do not come without adequate cause. Suffice it to say that all the evidence points to his having had a remarkable genius for combining forces and for associating vast accumulations of capital. He is admitted to have been as able a railway man as he was stock manipulator, giving as keen and far-sighted attention to physical properties as he did to the securities representing them. All this stands written on his career. What remains to be asked, however, is the question how he fitted into the time in which he lived, and what is the larger significance, both social and political, of such a course as that he ran.

He came rather late in life to his extraordinary prominence, but he had been for some years under that fierce light which, in modern democracies, beats upon men of great wealth. How did Mr. Harriman meet the peculiar demands which the organized life of the world to-day makes upon men in positions like his? That there has been a change in the attitude of democracies towards citizens possessing large fortunes, and the power growing out of them, cannot be doubted. It is visible to all of us everywhere. The art of being a very rich man successfully, is nowadays highly difficult. As well might a modern king think to get on by means of the autocratic and calloused methods of a mediæval ancestor, as that the owner of millions to-day should fancy that he could safely imitate the ways of the Fuggers or the Medici. Latter-day democracy has changed all that. It puts the very rich in a class by themselves, and exacts from them a bearing and a discharge of certain public duties curiously like what the people of decadent Rome expected, as Mr. Dill has shown us in a fascinating chapter of his "Roman Society from Nero to Marcus Aurelius," from the great proprietors of their day.

It will not do to say that a deep popular interest in rich men, and a kind of awed hanging upon their movements and their style of life, are absolutely new things in this country. When Talleyrand was in our young republic in 1794—the "good old days" of our pristine simplicity and purity—he found a worthy citizen of Machias, Maine, very anxious to go to Philadelphia to see not Gen. Washington, who was well enough in his way, but a Mr. Bingham, "who they say is so rich." Talleyrand added: "J'ai trouvé dans toute l'Amérique cette même admiration pour l'argent, et souvent aussi grossièrement exprimée." There was, therefore, no great novelty in the concentrated public interest with which Mr. Harriman was followed in recent years. His downsitting and uprising were compassed about with reporters. News about him and inventions about him were read with absorbed attention by millions of his fellow-countrymen. He stood as one of the chief symbols of his class—a name freely bandied about, abused more than he was admired, yet always a synonym of power, possibly of danger, but unquestionably of social and political importance.

The new thing in the conditions which Mr. Harriman had to face was not the observation, fawning or envious or merely curious, which has so long been fixed upon those having great possessions, but the kind of angry scrutiny with which the public has come to watch men of his sort. A changed community-consciousness in regard to the ownership of enormous wealth, is one of the things which not even boundless riches can afford to ignore. The people quietly assume a certain sort of right to dictate to the very rich. From them are demanded, or at least expected, large gifts for public charities. Their wealth is their own if they use part of it in accordance with public opinion; otherwise there is a tacit sense of injustice and oppression in the mere control of such vast resources. Moreover, and this is worth more notice, there is a pervasive demand that the magnate be magnanimous; that he cherish neither enmities nor revenges; that his business methods be of a live-and-let-live sort; that he seek no undue power, for the further piling up of gold, through the secret purchase of politicians to do his bidding.

Judged by these exacting tests, Mr. Harriman's career cannot be accounted either happy or successful. He was born

a generation too late. The imperious and ruthless methods which he too often adopted, used to be endured in a Commodore Vanderbilt, in a Fisk or Gould, but they were obsolete even while Mr. Harriman was employing them. We say nothing of his charities, for they may have been much larger than the public knows; but in his remorseless march to power over the wreck of other men; in his cold disregard of the human element in finance; in his impatience of criticism; in his clutching after and use of political influence to further his business ambitions, he was really out of joint with his day.

ART AND RAILWAY STATIONS.

A few years ago it was the fashion to indulge in artistic sneers at the sky-scraper. Our Pharisaical painters passed it by on the other side of the street. They turned, instead, to the barren reaches and rocks of Brittany or to the ruined castles of the Rhineland, as fitter subjects for their art. To-day it is a different tale. The office buildings of Manhattan, clothed in their wreaths of smoke and steam, our avenues, glistening in rain-wetness, reflective of lights from arc lamps and shop windows, have become an almost banal feature of current magazines and contemporary exhibitions. They are, at last, recognized themes for the painter and the etcher, as for the artist in words. Nowadays, Ruskin to the contrary notwithstanding, there is also a moving beauty in our railways.

The railway carriage has found its way into verse. Baudelaire, taken with a great horror of towns, cried out:

Emporte-moi, wagon! enlève-moi, frégate!

Even so, the poet thought it well to import a ship into his verse, to make it more conventional. There is Verlaine, to be sure; poor Verlaine, who, in his poem of the "Belle Chanson," invites us to admire

Le paysage dans le cadre des portières,

but that is rather a different matter. Even Henry James has felt something of the unexploited poetry of the railway. His confession of the kindness that he feels for stations is just what one had a right to expect: half whimsical, half serious. He likes them æsthetically, he tells us; he views them with complacency, even when he would neither come nor go. "They remind me," he says, in one of his essays, "of all our reciprocities and activities, our energies and curiosities." And the spectacle of Paddington or Euston offers an exhibition of variety in type which compensates him for having to live a part of his year in London.

Time was when the railway station was called a "deepo" and was an architectural horror. In those days there was indeed much need to philosophize and transcendentalize if one was in the least to enjoy its "spectacle." As we have watched the construction of the newest of the New York stations, we have, however, felt that the building of the past and that of the present are two very different matters. Just as the mystical imagination and aspiration of the Middle Ages found their ultimate expression in cathedrals which remain to-day, centuries after, the noblest monuments of Christian faith and of European civilization, so is the modern railway station a kind of memorial and evidence of the vast energy and insistent utilitarianism of this twentieth century. We live in the age of the machine; what more proper than that we should express ourselves in brick and stone dedicated, not to a Saint, but to the heroes of our Dusk of the Gods, the twin dæmons Steam and Electricity. And the greatest temple to these demigods thus far erected is the building that fills four blocks in this city, and that will soon be sending its trains out to east and to west, to north and to south, through tunnels that burrow under great rivers. We are proud, in our way, of our demigods, and of their celebrants.

Sometimes, in viewing the pictures of our office-buildings, with their noses pricking the clouds, we have thought the artist's work too cleverly managed for anything except effectiveness. The veils of smoke and of steam have been adjusted almost too coquettishly. There is at least no need to idealize these new railway stations, for which we hope some Monet will in time emerge. Monet has found Charing Cross and Montparnasse subjects worthy of the brush that renders the flower-gardens and the mists of his exquisite Giverny. Who will prove to be the Monet of Eighth Avenue? "I would give anything," Lafcadio Hearn once wrote, with London roaring in his ears, and his heart full of the bitterness of things, "to be a literary Columbus, to discover a romantic America." As to the matter of an America romantic for the man of letters, we dare not answer very positively. If, however, Laurence Sterne could discover the poetry of a *désobligeante*, why should not his literary heirs find it in a Pullman coach? And certain it is that for the painter a romantic America stands very close at hand.

THOUGHTS OCCASIONED BY THE BI-CENTENARY OF DR. JOHNSON.

I.

I suppose that I ought to begin this brief paper with Lichfield and the 18th day of September, in the year of our Lord one thousand seven hundred and nine, where and when the subject of what some persons regard as the greatest of all biographies was born into a world not soon likely to forget him. For reasons of my own, I wish to begin it at Oxford, and at a much later period.

It is almost superfluous to say that there is scarcely another town of its size that calls up before the mind of a sojourner such a host of distinguished names as Oxford can summon from out the past. Keble, Pusey, Newman, with Shelley for a counterpoise; Burne-Jones and Morris and Swinburne and Arnold and Pater, Freeman and Froude and Stubbs—these are names that come to me almost at random, and they are all comparatively modern. Probably a true latter-day Oxfordian could not have written the preceding sentence without inserting the name of Jowett. I am not myself enough even of an adopted Oxfordian, despite many profitable hours I have been permitted to spend in the Bodleian, to venture to make a list, however short, of typical Oxford men whom every true son of the university should honor. All I am competent to do is to say that, whenever I go to Oxford, one great personality emerges from the unending file of its notable sons, and stands apart for my imagination with a peculiar and extraordinary impressiveness.

II.

Why is it that my thoughts and my feet always turn first to Pembroke College? Johnson said that in his day it was a nest of singing birds, but I am afraid that the good Doctor knew very little about singing. With Spenser, Milton, Dryden, Gray, Wordsworth, Byron, and Tennyson enrolled among the sons of Cambridge, it seems to be as plain as anything can be in the realms of taste that the university on the Cam has a decided advantage over Oxford as a nursery of songsters. If I were in a pessimistic mood with regard to the present and future of British poetry and wanted to walk among bare ruined

cholrs where late the sweet birds sang, I should certainly desert the banks of the Isis for those of the rival river, and I should not need to reëxamine the contentious poems of Thomas Warton and William Mason before making my choice. But Oxford has enough great poets of its own to render so invidious a comparison unnecessary, and, as the seat of poetic charm, the nursery of poetic idealism, has this home of lost causes any real rival among institutions of learning?

Dr. Johnson, however, was not a poetic or a charming personality, and he was far from being a representative idealist. The spell of the Middle Ages hangs about Oxford; Johnson is usually considered to have been a typical product of the eighteenth century. Oxford has been the *alma mater* of some of the greatest writers and scholars England has produced; it is open to doubt whether Johnson was a great writer at all, and the quality of his scholarship was hardly commensurate with its wide range. Even in those features of his character in which the stamp of his university is most clearly seen—his devotion to lost causes and his reverence for the Established Church—Johnson seems less memorable than many another Oxford man. We naturally associate the great lexicographer either with Cranford or with the metropolis he so dearly loved, and probably many a modern reader who has a fairly clear idea of his personality would be puzzled to tell offhand which university he attended, or whether he received any sort of formal academic education. Why in the name of all that is reasonable should Dr. Johnson dominate the mind of any sojourner in Oxford?

III.

That he does dominate other minds than mine was proved for me a few years ago by a chance encounter with a fellow American in the smoking room of a small Oxford hotel. The source of my agreeable compatriot's income, if I recollect aright, was that useful metal, copper; the source of his chief delights was Boswell's "Life of Johnson." He carried about with him a handy edition, but he also carried enough of his favorite book in his head to astonish such reticent Britons as he could manage to engage in conversations having his hero for theme. I am inclined, however, to think that the average American visiting Oxford does not pack Boswell alongside of Baedeker. Doubtless Johnson's uncouth, portly form recedes from the imaginations of most visitors, native or foreign, a few moments after they have lost sight of the memorials of him preserved at Pembroke College. For one person who in his mind's eye sees him haranguing his fellow-students in a thread-bare gown or tossing away the new shoes put in charity at his door, there are probably dozens, who, as they move along the narrow streets or make excursions into the adjoining country, repeat to themselves phrases from Arnold's preface or lines from "Thyrsis" and "The Scholar-Gypsy." Any person likely to wonder whether Johnson ever returned to the library of Pembroke the copy of Lobo he trudged so many miles to borrow is still likelier to know the obvious facts in the case from Birkbeck Hill and to refrain from making inquiries. Scores or hundreds of people go to Oxford yearly in order to manifest their veneration for Newman or Pusey; how many really venerate Johnson's memory there or anywhere else? Certainly in no place connected with that memory will one see three spinsters standing in such dense awe as enveloped, one September afternoon, three mute worshippers at the Shelley shrine attached to University College. Those ladies—my countrywomen, I think—bent their eyes, now on the recumbent marble form, now on the star-spangled vault, now on their note-books, and I could not help wondering what use there would be in erecting memorials of questionable taste if there were not a fairly constant number of sentimental persons ever eager for a chance to wreak their emotions. It would be as easy, however, to sit comfortably on a barbed-wire fence as to wreak one's sentimentality over Dr. Johnson or anything connected with him.

IV.

But sentimentalists are not my game, and it is scarcely necessary to add that my reference to those three spinsters I once encountered casts no reflection upon intelligent admirers of a poet whose genius in the sphere of essential lyric poetry is almost unrivalled. What I am bent upon is to determine the reasons why, whenever nowadays I stand upon or approach a spot connected with him, the burly doctor's form fills up, if I may so phrase it, the landscape of my imagination. I have never been to Uttoxeter, but, save St. Giles, Cripplegate, where Milton lies buried, there is scarcely a spot in England that could make more impression upon me than the market-place in the little Staffordshire town where Johnson, by standing in the rain on the site of his father's book-stall, expiated a youthful act of disobedience. That was surely not an heroic feat; from some points of view it was rather a foolish one. If the late Earl of Beaconsfield, or one or two American politicians who shall be nameless, had performed it, I should have been among the first to call it theatrical. In Dr. Johnson, it seems to be a pathetically impressive act of true filial piety, with the elements of sentimentalism and self-display eliminated.

Why do I dissociate from Johnson whatever is merely spectacular, and why does the epithet "impressive" present itself spontaneously whenever I think or write about him? Loyal Johnsonian though I hope I am, I cannot but admit that he was little of a poet; that as a biographer he was surpassed by his follower, Boswell; that he was not the greatest of British scholars; that, although the soundest and sturdiest critic of his day and still unrivalled in his common sense and probity save possibly by Dryden, he was not a very philosophical and acute judge of literature; that as an essayist in the strict sense of the word he fell far short of his predecessor, Addison; that as a writer of fiction, despite the solid merits of 'Rasselas," he is not to be compared with Defoe, or Fielding, or Richardson, or even with Goldsmith; that as a moralist he could well have afforded to exchange some of his wholesome sententiousness for a little genial persuasiveness; that as an editor of Shakespeare he was lazy and somewhat slovenly; that, finally, even as a lexicographer he was not entirely above reproach. Undoubtedly, the Dictionary was a great achievement, and so was the "Lives of the Poets," but, when he endeavored to tread the higher walks of literature, his gait was, to say the least, unsteady. The author of the "Life of Richard Savage" was also the author of "Irene," a tragedy which I have not ventured to re-read within the past twenty years. I doubt if I ever shall re-read it, unless—to borrow an amusing remark of Longfellow's with regard to some forgotten or never-known poem—a special act of Congress is passed making such reperusal compulsory upon me. We may smile approvingly at Garrick's epigram to the effect that Johnson had beat forty Frenchmen and would beat forty more—we may add that he browbeat a much larger number of Englishmen; but we must admit that, when every allowance is made for his writings, they bulk small indeed in comparison, for example, with those of his great French contemporary Voltaire.

I value personally "Rasselas" and the "Lives," "The Vanity of Human Wishes," "London," the stanzas on Levett, and some of the impromptu verses, many of the essays in "The Rambler" and "The Idler," the preface to the Shakespeare, numerous letters besides the famous one to Chesterfield, and, last but not least, the prayers and meditations. I value these, and I have reason to believe that in over twenty years of teaching I have helped to make others value them. But with all my admiration for Johnson, I must admit that he left behind him after a long life a very small amount, perhaps too small an amount, of excellent literature to serve as the basis of an imposing and enduring fame. His concrete achievements are neither numerous nor of an exceptionally high or-

der of merit. Even in his own club he was surpassed as a writer by Goldsmith, Gibbon, and Burke—perhaps by Boswell, too—and he obtained in no single line save as a talker the preëminence of Garrick and Sir Joshua. Can it be that, after all, those persons are right who maintain that Johnson was not truly great save in his capacity as the Ursa Major of Gray—Gray the true poet, sensitive, lover of nature, charming letter-writer, and splendid scholar, to whom Johnson devoted the very worst of all the "Lives"? Can it be that they are right in asserting that the Cham of Literature would not live in our memories to-day, had he not, most inconsistently, allowed a little Scotch sot to toady him?

V.

That these hostile critics of Johnson are partly justified in their contentions cannot well be denied. If Hawkins's biography had remained the standard, if the literary dictator had overawed into silence or nervous prostration Mrs. Thrale and Miss Burney, if he had used on Boswell's obsequious head the club he bought for Macpherson's, it is scarcely open to doubt that not one educated person out of a hundred would be greatly interested in Johnson in this, his bi-centennial year, or would be familiar with his peculiarities and not ignorant of his works.

On the other hand, it may be argued that, while it is Boswell who has really made Johnson known in detail, it is Boswell and the infirmities of human nature that have obscured for many readers the essential greatness of Samuel Johnson's character. Is our ability to quote a man readily and to see in imagination the veins swelling on his forehead as he gulps his tea any proof that we really comprehend his personality? Is not our interest in biographical gossip often satisfied at the expense of our appreciation of a life and character in their totality? In the case of the famous doctor, do we sufficiently realize the fact that in the years before Boswell's narrative becomes copious, Johnson through sheer mental and moral force and through solid acquirements rose from obscurity to comparative eminence, overcame poverty and physical defects that would have daunted most other men, maintained a stanch independence even in Grub Street itself, cherished his old mother and his scarecrow wife, made himself, as his means permitted, the almoner of the distressed, and finally became the commanding central figure of a group of exceptionally able men? Did Johnson dominate such men as Burke and Goldsmith and Reynolds and Garrick and Gibbon merely because he was a very gifted talker of exceedingly bad manners? Were his pension and the interview with George III, that so flattered his loyal soul, due in the main to his political recalcitrance and his ecclesiastical obfuscation? Could Boswell's biography, as I have more than once had occasion to ask, possibly have been such a great book, had not its subject been a very great man? Has the English race in its entire history produced many personalities as robustly and wholesomely impressive as that which emerges when Boswell's biography and Johnson's own works are thoroughly read and not merely skimmed?

No one who will take the trouble to answer these questions—not hastily, but after some reflection and perhaps some refreshing of his memory—will be likely to be seriously indignant with me when I confess that, with John Milton set aside, I can think of no Englishman for whom I have a greater real veneration than I have for Samuel Johnson. Whatever he was or was not, one thing at least he was—a man!

New York.

NEWS FOR BIBLIOPHILES.

The bibliography of Pope's "Essay on Man" has never been properly worked out by any of his editors and commentators. Indeed, the whole bibliography of Pope's writings is a half-explored field. Yet he was the greatest English poet of his century and his books are rare enough and show variations enough to interest collectors.

Marshall C. Lefferts has for a number of years lost no opportunity to add editions or variations to his collection of Pope's works, and had planned a Pope bibliography, the publication of which he has, however, now definitely abandoned. The following notes as to the editions and variations of the "Essay on Man" have been, with his permission, made from his books.

The poem was published in four parts or "Epistles," from February, 1733, to January, 1734. Each, it is said, was issued simultaneously in folio, quarto, and octavo, but it is the folio which is usually considered the first edition, though the quartos and octavos seem to be even rarer. Mr. Lefferts has three of the octavos, but has never seen one of the quartos. The first edition of the first Epistle appears in two forms, both having the title "An Essay on Man. Address'd to a Friend. Part I. London: Printed for J. Wilford, at the Three Flower-de-Luces, behind the Chapter-house, St. Pauls." The form that appears to be the earlier has been heretofore undescribed. It consists of nine leaves, being signatures A, two leaves; B, one leaf; and B (repeated), C, and D, each two leaves. The title (verso blank) and "To the Reader" (two pages) make up the first signature. The text is paged [5], 6 and 9-20, 7 and 8 being omitted from the pagination. Each page of text (except p. 5) has a headline "Epistles," and the page number is in the outer corner. Only the first two pages have the couplets spaced apart. Only three copies are known to Mr. Lefferts besides his own, two being in collections in England (one lacking the title-page) and one in Chicago. The second form (heretofore considered the first edition) consists of ten leaves, signatures A to E, each two leaves. The title and "To the Reader" are identical with the first edition, and were doubtless printed from the same forms. The text is correctly numbered [5]-19. There are no headlines, and the page numbers are in the centre, as is the case with later editions of this Epistle, and with all the editions of the other Epistles. The couplets are all spaced apart, giving the book one more page than the first edition. It was printed on larger sheets than the other, with wider margins.

The first octavo edition has a title with the same wording, but the imprint contains the date, 1733. It was printed, evidently, from the second form described above, as it contains the same error in line numbers, 245-249 being repeated. Though in a smaller type, it is page for page with No. 2, except that pages 17 and 18 each contain two lines less and page 19 four more lines. Elwin is mistaken in saying that the "Address to the Reader" is not in the octavo edition. It is certainly found in Part i.

Another small octavo edition was printed in Dublin, with title as the preceding, but styled "Second Edition," with different publishers, and dated 1734. It was evidently printed from one or the other of the two preceding, though the error in the numbering of the lines has been corrected. These four editions all designate the book as "Part I."

In the third folio edition the title is altered to "An Essay on Man. In Epistles to a Friend. Epistle I. Corrected by the Author," with imprint same as No. 1. The two-page address "To the Reader" of the earlier editions has been suppressed and a new one of seven lines only substituted. "Contents" of Epistles i, ii. and iii fill pp. [4-6], giving the book eleven leaves. A number of changes were made in the text This was probably issued late in 1733, before Epistle iv was published, but after the publication of Epistles ii and iii.

Another folio edition (actually the fourth) has the words "The Second Edition" added below the line "Corrected by the Author," and has the date 1735 in the imprint. It is page for page with the preceding, but is reset and has different printer's ornaments.

The first edition of the second Epistle has the title "An Essay on Man. In Epistles to a Friend, Epistle II, London: Printed for J. Wilford, at the Three Flower-de-Luces, behind the Chapter-House, St. Paul's." It consists of ten leaves, signatures A, B, C, and D, each two leaves, and E, one leaf, made up of half-title, title, and "To the Reader," each one leaf and text, pp. [5]-18.

The second edition has the same collation, but is reset throughout with different ornaments. The most notable variation is that in this second edition the lines are not numbered.

Wilford's octavo edition of this part has title dated 1733, but is paged continuously from Part i, pp. 23-26. There is also a corresponding Dublin reprint called "Second Edition" with title dated 1734.

The first edition of the third Epistle has the same title as the second except for the substitution of "Epistle III." It also consists of ten leaves made up of half-title, title, and text, pp. [5]-20. At the end is this notice in two lines: "N. B. The Rest of this Work will be published the next Winter."

The second edition of the third Epistle, though entirely reset, differs very slightly. The vignette on the title of the first edition

has in the centre an open book, in this edition a spread eagle. The page numbers are in a larger type, errors in line numbers are corrected, and the notice at the end is in a single line.

Wilford's octavo edition is paged 37-55 The lines are correctly numbered. The Dublin edition, with title dated 1734, has separate pagination, and, as it contains the same errors in line numbers as the first folio edition, we may presume that it was printed therefrom.

There was apparently but one folio edition of Epistle iv. This, which has a title corresponding to the other parts, has twelve leaves, signatures A to F, each two leaves, made up of title and "Contents," each one leaf, text pp. [1]-18, and advertisement "Lately Published the three former Parts," etc., one leaf.

Mr. Lefferts has not been able to secure Wilford's octavo edition of this part. In the little Dublin reprint called on the title the "Second Edition," the errors in line numbering are corrected.

The four Epistles were collected in 1734, in one volume, quarto, with continuous pagination, with title-page: "An Essay on Man, Being the First Book of Ethic Epistles. To Henry St. John, L. Bolingbroke. London: Printed by John Wright for Lawton Gilliver, MDCCXXXIV."

This book has the appearance of having been extracted from another volume, but no edition of the works agreeing precisely with it can be traced. It is the only copy seen by Mr. Lefferts. It seems to be from the same forms as the "Work of Mr. Alexander Pope, Containing his Epistles and Satires," 1737, on thick paper, but, while having the same title, it differs from the "Essay on Man" as included in "Works." vol. II, 1735.

The first edition with Warburton's commentary and notes appeared in 1743, and later editions in 1745, 1746, 1748, and 1763.

Correspondence.

SQUARE MEASURE.

To the Editor of The Nation:

Sir: Among all the tables of "compound numbers," which vexed our infancy and still resist the rational simplicity of the metric system, by far the worst is that one absurdly miscalled "square measure." Even in its lineal base, the intrusion of a fraction, 16½ or 5½, between foot or yard and rod, must always arouse suspicion, as well as resentment, even in the childish mind. In truth our table looks like an attempt to reconcile four discordant systems. Certainly as to the square mile, acre, rod, and foot, each larger unit utterly refuses to contain the next smaller one, in square form, an integral number of times. The acre is the frankest alien, for it cannot be laid out square at all, save with a length of side incommensurable with any unit of length known to us.

Certain other peculiarities of this table are so interesting, and to the present inquirer at least so novel and puzzling, that he hopes some specialist can throw more light on its origin.

The mile, in all its variations, both of extent and of name, from the late Greek μίλιον down, must no doubt descend from the *mille passuum* of the Roman legionary, counted with the left foot only. The German *meile*, used for a league or hour's walk, is most in need of explanation. But even there the word, at least, is a perfectly normal "guna" formation (m-a-ïle), exactly like the English, from *mile*.

The square mile is most simply and naturally divided by successive quarterings. The first produces our quarter-section, or normal homestead; the second seems to have no important history, while the third is recorded in the old word "fur-long," *i. e.*, furrow-length; a real furrow, presupposing of course not length alone, but area.

The phrase "ten-acre lot" has a certain familiar and traditional sound in all ears. To the average mind it calls up a goodly expanse of turf or ploughed land, with an associated feeling of its natural or duly unified extent. Its normal shape is presumably square.

Now, I have yet to chance upon the farmer, or citizen, who will give offhand, when first questioned, the exact side-length of that same familiar square ten-acre lot. Yet it is precisely the furlong, or normal length for a straightaway furrow. The most familiar type of field, then, is the square furlong.

Certainly that is no accident. And yet, the method of division is here violently changed. The square ten-acre lot cannot be cut up into square acres. Our decimal system cannot express the side of the square acre at all, in feet or inches, furlongs or miles!

However, the square furlong or normal lot can be cut up into two rows of five equal oblong rectangular strips, measurable in integral feet, each 330x132 feet. That is the acre.

Yet the acre, though not obtainable by any quartering process, is itself promptly quartered, into *roods*. The Century Dictionary, which as to etymology was inspired by William D. Whitney, most competent of linguistic scholars, does not clearly differentiate the word "rood," in origin, from rod. Yet there is at least a strong temptation to connect it with the special use of the form "rood" for cross (*cf.* Holy rood), and to call attention to the *cross* formed in the attempt to quarter the (oblong) acre.

Yet again we descend to the rod, which is obtainable from the rood, after three bisections, only by cutting sets of five oblong slices, much the same shape as is the acre when derived from the furlong.

Of course, the rod can also be laid out in many other shapes, including the familiar square, 16½x16½ feet. But a square rood or square acre cannot be completely cut up into patches of a square rod each. So here again "square measure" is a glaring misnomer. But the question asked is:

How came it so? Whence, in particular, the "acre"?

A few remarks on kindred topics may be added.

The furlong is far more familiar to youthful ears to-day as the "220 yards dash." One is tempted to imagine for our ancestors a communal system of agriculture, in which every able-bodied man was given the use of a square furlong or ten-acre field, and so could race, on his own side the hedge, with plough or seed-basket, harrow or hoe, against any one of four conterminous rivals, to his heart's content. Is that a purely imaginative sketch?

The coincidence of this distance, the furlong or 220 yards, with the Greek stadion is not, after all, remarkably close, but yet is hardly a mere chance. The stadion is exactly 600 times a Greek foot, and that unit differed only by 1-100 from our English foot. It is probable that the Greeks had ascertained by experiment that 600 feet is about the distance for which a maximum speed can be secured without a flying start. A hundred yards is too short to make up the initial loss in gathering speed; on the other hand, the limitations of breath and muscular strain forbid the continuance of the full sprinting pace for, e. g., a quarter mile.

The Greeks did, indeed, also run races of several laps, but only up to a mile or so. The atrocities of the miscalled Marathon race, or grilling long distance run, as a form of "sport," they left to Hesperian barbarism.

In closing, a mention of one more exact Hellenic parallel may be ventured. If accidental, it is indeed remarkable. The all but perfect coincidence between the Greek and the English "foot" has been already mentioned. Another unit in wide usage, with no less clear physiological basis, is the cubit (Lat. *cubitus*), or πῆχυς. The Greek, like the Latin word, is the ordinary one for "elbow." Our "ell" has the same origin, but in "ell," as in "yard," the measure usually appears doubled. The πῆχυς, as a measure of of wood or stone, at least, long remained just about 1½ feet, 18 inches, *i. e.*, the distance from the elbow to the extended fingertip of a normal man.

Now, our "rod" is just eleven cubits, 16½ feet. The name rod, or pole, pretty clearly intimates that it is the length at which a man can conveniently handle a wooden staff or measuring stick. Since Homer is our fountainhead for all Hellenic usage, in his works a parallel passage is naturally to be sought. As a matter of fact, he ascribes precisely the same length, eleven cubits, to the noblest ash-wood rod wielded by human hands. Hector's spear is twice mentioned as just "eleven cubits long." Evidently this was the "handy" length, in war or peace. The rod, then, is explicable. But—whence the acre? Wm. C. Lawton.

Scranton, Pa., September 7.

CHANGED MEANINGS.

To the Editor of The Nation:

Sir: I observed in a bookdealer's window a few days ago a set of school readers bearing the general title of "Stepping Stones to Literature." Though Tennyson once wrote about rising on stepping stones, the use has a queer look to one who, for more than half a century, has considered the only function of stepping stones to be that of assisting the foot traveller to cross a stream dry shod.

I don't know whether any writer has treated the subject of such alterations in the meanings of words as are brought about by ignorant usage in the first instance; but from my observation of certain changes of this sort which are still in process, it seems to me that there is good reason for noting that written speech is subject to this sort of modification. Take, for instance, the

words "lurid" and "livid." I am unable to recall any example before the civil war of the use of these words in the sense respectively red and pale, as the daily newspapers seem to have decided shall be their meanings hereafter. We now read of the "lurid" flames of a devouring fire, and of the "livid" face of a corpse. Some dictionaries have already gone so far as to sanction these usages.

In the list of proper names in the "Standard Dictionary" I note the word "Frankenstein," with the following definition: "Hero of the story; a man monster." In Mrs. Shelley's story of that name, poor Frankenstein is the victim of the monster, instead of being himself the monster; but if our dictionaries approve of the transfer of qualities as above, it will probably have to be accepted. That was what happened to "incarnadine," which was used as an adjective in the following description of the phœnix in Sylvester's version of the "Divine Weeks" (Week 1, Day 5), several years before Shakespeare used it in "Macbeth" as a verb:

Two sparkling eyes; upon her crown a crest
Of starry sprigs more splendent than the rest;
A golden down about her dainty neck;
Her breast deep purple; and a scarlet back;
Her wings and train, of feathers mixed fine,
Of Orient azure and incarnadine.

Sylvester was intimately acquainted with the French language, and undoubtedly expected readers to understand that the wings and tail of his phœnix were blue and light red, such as may be seen in the eastern sky a little before sunrise. In turning the adjective to a verb, Shakespeare also consciously or unconsciously deepened the indicated color to the hue of blood. To satisfy my curiosity as to the original, I turned in the 1578 edition of Du Bartas to the corresponding lines and found that they had been much expanded in the translation. They are there as follows:

Il fit briller ses yeus: il lui planta pour créte
Un astre flamboiant au somet de sa tête:
Il couurit son col d'or, d'écarlate son dos,
Et sa queuë d'azur.

Sylvester not only changed the sex of the bird, but also gave it new "points": as the incarnadine tint. The word "flamboiant," occurring in the original lines, however, leads one to reflect that great modifications have been made in the signification of this word also. In a magazine just opened I find a notice of a contemporary swaggering romancer, in which he is characterized as flamboyant. In the French text, the word is pretty nearly if not quite synonymous with the English "twinkling."

"Stalwart," we are informed by certain etymologists, is a modification of the Anglo-Saxon "staelwyrdhe," meaning worth stealing. If this view is correct, a great change has come over the face of the expression.

In the *North American Review* for this month Senator Clapp talks of a "recrudescence of interest" in a political question. Twenty-five years ago this would have been an incorrect use, but on turning to the "Standard" I find "revival" given as one of the definitions of "recrudescence." Although it is not yet so given in other dictionaries it may be hereafter, and the user is probably excusable at this time.

I am not forgetting ignorant transformations of foreign words, like "el lagarto" into alligator; "purgatoire" into picketwire; "chassez" (in calling figures of dances) into sashay, and the like—but that kind of error has been often written about. My object at this time is to call the attention of some investigator to a source of change in language that is likely to be more and more productive as our already immense vocabulary grows still larger.

THERON W. HAIGHT.

Waukesha, Wis., Sept. 1.

DANTE IN AMERICA.

To the Editor of The Nation:

Sir: A recent number of the *Nation* (August 19) contains a review of Toynbee's "Dante in English Literature," and the reviewer notes that no allusion occurs to the influence of Dante upon American writers. Oelsner, in "The Influence of Dante Upon Modern Thought," refers to American devotees of the Tuscan bard only in a footnote, mentioning Longfellow, Lowell, Parsons, Norton; and your reviewer gives us the same names. Permit me to say there are other names not to be overlooked in connection with early Dantean study. George Ticknor is probably the pioneer in this field. Ticknor, while studying at Göttingen, 1815, bribed Balhorn, a lawyer and Italian scholar, with fine Havana cigars, to instruct him in Dante. Prof. Karl Förster described Ticknor as an excellent Italian scholar, who had translated from Dante as early as 1807. Ticknor's journal refers to weekly meetings for the study of the Divine Comedy, held at the house of Dr. de Crollis, in Rome, in the early thirties. About 1831 the American historian expounded Dante to special classes at Cambridge, Mass. In presenting King John of Saxony, himself a profound Dantist, with Longfellow's translation, Ticknor recalls the enthusiastic meetings of the Accademia Dantesca (1835-36) held in the Royal Palace, Dresden. The *lampada vitæ Dantescæ*, so to say, was handed on by the historian of Spanish literature to the historian of the Conquest of Mexico and Peru, and in the letters of Prescott are found some fine appreciations of the genius of the divine poet.

Just now discussion is warm upon the subject of priority in Polar exploits. The discovery of Dante is an interesting item in the annals of American scholarship; let us do due honor to those who first blazed out the path. WILLIAM KINGSTON VANCE.

Fresno, Cal., September 8.

JOHN BUT.

To the Editor of The Nation:

Sir: As a foot-note to the correspondence in the *Nation* (March 25, April 29, and May 13), concerning "Piers Plowman," it may be added that the extraordinary "John But" (who, according to Professor Manly, wrote ll. 56-99 of Passus xii, A-version), may have been something more than a mere scribe or minstrel, as Professor Manly says (Cambridge Hist. of Eng. Literature," II, 35), since the very name occurs in the "Paston Letters," attached to a person well above that rank:

Ryth Wyrchypful hwsbond, I recomawnd me to zw, desyryng hertyly to heryn of zour welfare, praying zw to wete that I was with my lady Morley on the satyrday next after that ze departyd from hens, and told her qhat answer that ze had of *Jon Butt*, and sche teke it ryth strawngely. (Margaret Paston to John Paston, April. 1448.)

John Butt was evidently, as the context shows, a tenant or agent of Paston or Lady Morley. In any case, he lived in East Anglia, where the Morleys and Pastons fought their feuds out. It is not impossible that he was the son or godson of the man who helped "Will" with his vision.

HENRY NOBLE MACCRACKEN.

Literature.

HANOTAUX'S HISTORY OF CONTEMPORARY FRANCE.

Contemporary France. By Gabriel Hanotaux. Translated from the French by E. Sparvel-Bayly. With portraits. Vol. IV (1877-1882). New York: G. P. Putnam's Sons. $3.75, net.

With this fourth volume, M. Hanotaux brings to a conclusion his remarkable narrative of French history since the war of 1870-71. It has, with the advantages which belong to the work of one who has lived through the events and can recollect the impression which they produced at the time when they occurred, some of the disadvantages inevitably incident to the writing of history before there has been time for the full result of events to be perceived, before the smoke of conflict has cleared away, before the personal feelings of predilection or antagonism which naturally attach to the leading personages in the mind of the spectator have had time to subside. Only a Frenchman, and perhaps only an exceptionally well informed and impartial Frenchman, could determine how far these feelings have warped the judgment of M. Hanotaux, who has himself been a party man and a minister and been brought into close touch with some of the men most prominent in the political conflicts of the time he describes. To us, such feelings are discernible, but M. Hanotaux seems to have tried to keep them within bounds. There are few traces of personal or party hostility in his portraits, or in the anecdotes by which they are set off; and the partiality he shows for Gambetta is pardonable when one considers how much there was in that statesman's character to attract admiration, how much in his fate to awaken sympathy.

The period covered in this volume is six years, whereas the preceding three volumes, taken together, covered only seven. This gives it the character of being hurried, as compared with the leisurely march and copious details which belonged to its predecessors. A large part of it, moreover, is occupied by foreign affairs, although in most of these the part of France was a secondary one.

The historical student will not regret the comparatively full treatment given to these general European questions, for they are matters of extreme magnitude, and M. Hanotaux, from the knowledge he acquired while in the French Ministry of Foreign Affairs, is able to throw some fresh light upon them. They all relate to the Nearer East. They include the troubles in southeastern Europe, which began with the Herzegovinian insurrection in 1875, which developed into the Servian war of 1876 and the abortive Bulgarian rising of the same year. They cover, but do not sufficiently emphasize, the terrible massacres perpetrated on the Bulgarians by the Turks that summer, massacres which, after futile negotiations between the Great Powers, brought on the war of 1877-78 between Russia and Turkey, and wound up with the Treaty of Berlin in 1878. They also note the occupation of Tunis by France in 1871, and just touch, with a disappointing brevity, the earlier stages of the process by which England was led to take sole authority in Egypt in 1882, France retiring from the so-called Dual Control.

The chapters which deal with the Eastern Question from 1875 to 1878 are full of interest. They present the view of a well-informed diplomatist belonging to that one among the great Powers which took the least active part in the negotiations and controversies, and was in so far best qualified to judge the conduct of the others. They also quote from two unpublished sources: the "Recollections" of Count Peter Schouvaloff, who represented Russia at the English Court in these difficult years, and was one of the Russian plenipotentiaries at the Congress of Berlin, and the also unpublished "Memoirs" of Karatheodori Pasha, who was the senior representative of Turkey at the same Congress. These two sources supply less than one might have expected, but some of the details given by Count Schouvaloff, who was a man of note in his day, and possessed of plenty of talent, have a certain interest, throwing a personal light on the attitude of the leading personages to one another.

M. Hanotaux does not succeed in making his account of the course of events during these three momentous years so clear as might be desired by a reader who does not carry the main facts in his own mind. The chapters are rather a running commentary than a narrative. His appreciation of the situations and the action is always intelligent, but not always correct, and he omits or slurs over some material factors. For instance, although the outburst of feeling in Russia in the middle of 1876 is referred to, the pressure of Russian public opinion on the Czar to go forward against Turkey, and the commanding rôle of Katkoff and his newspaper, are not duly brought out. This is still more the case as regards England. It has often been said the Americans are the only people outside England who can understand the English. It is especially hard for the French to do so. M. Hanotaux has not got to the bottom of the movements of opinion which swayed England during 1876, and the two following years. He has not quite realized that Disraeli, then Prime Minister, was inclined to fight Russia and would have liked to bluff his own Cabinet into war, but that the Cabinet, partly through their own better judgment of the real sentiment of the nation, partly because Gladstone had roused the nation against the Turks after the Bulgarian atrocities and was always ready to fall upon the Ministry with his overwhelming personal force, contrived to hold the Prime Minister back and succeeded in preventing that complete breach with Russia which seemed several times imminent. It was, perhaps, not necessary for our author, in mentioning the Cyprus Convention, made by the British with Turkey, and the secret arrangements made by them with Russia about Batum, to point out the results (eminently disappointing for England) of these two acts, for they did not directly affect France. But they illustrated so well the policy which Disraeli followed that a mention of them would have set his character and capacity for a great foreign policy in a truer light than they bear in the pages of this history. The account of the Congress of Berlin is well done, yet it is odd not to find, among the dicta which M. Hanotaux records, Bismarck's appreciative remark on Disraeli, "The old Jew, that is the man," and the well-known characterization, attributed to De Launay, of Lord Salisbury as "a lath painted to look like iron." As a patriotic Frenchman, M. Hanotaux regrets that France kept herself so much in the background during these struggles. Others may think that she exercised a judicious prudence. Her interests were not really affected. She had nothing to lose by the advance of Russia, and little, if anything, to gain by claiming a share of such booty as was going. It remains to be seen whether the acquisition of Bosnia will turn out to the real profit of Austria. Assuredly the acquisition of Cyprus has brought no profit to Great Britain. Without much effort, France did, in fact, secure one important acquisition, viz., Tunis, for it was at the time of the Congress of Berlin that the British Government intimated that they would give her a free hand there; and as Bismarck subsequently did the like, wishing (as is supposed) to turn her ambitions outside Europe, and perhaps also to heap on her fresh liabilities which she might find embarrassing, she presently went ahead, and, in 1881, made herself virtual mistress of Tunis, much to the annoyance and disappointment of Italy.

In the chapters which contain the French part of this story of six years, the most striking and dramatic scenes are those which preceded and accompanied the last struggle of the monarchical parties in the general elections of October, 1877. "Monarchical" one may call them, because, though the form of government was not openly and avowedly in question, the Ministry of the Duke de Broglie and M. de Fourtou, which conducted the campaign under Marshal MacMahon, were virtually fighting for a monarchical restoration, and their defeat proved to be the *coup de grâce* to every monarchical section, Legitimist, Orleanist, Bonapartist. It is true that the chances of Bonapartism were not deemed to have wholly vanished till the death of the Prince Imperial, Louis Napoleon's only son, in a skirmish in Zululand during the war of the British with the Zulus in 1879; nor those of the House of Bourbon till after the death, long afterwards, of the Count of Paris, to whom the rights of the Count of Chambord descended. Representatives of Napoleon the First and of Henry the Fourth do, indeed, remain: but the pretensions of both have melted hopelessly away. The danger from a dictatorship which subsequently threatened France, in a year which lies later than the period covered by this history, did not proceed from any member of either line, and did not spring from any sentimental or traditional attachment to the monarchical principle.

In M. Hanotaux's pages, the hero of the combat and the victory which has established the Republic in France is Gambetta. Our author dwells with enjoyment upon all his oratorical achievements, and brings the tale to a close when the short lease of power which the great popular chief had at last obtained comes to its sudden end. He faintly indicates, rather than ventures to describe, the causes which began to rob him of real authority as soon as he had officially secured it. This is a pity. Gambetta's career was brilliant enough and will be long enough remembered to permit even his admirers to disclose and explain the causes which weakened his influence. Incidentally, we have an account of the singular series of communications which passed between him and Bismarck. Not long ago there was a lively controversy in Europe over the matter. Some one alleged that Gambetta had actually gone to Berlin and seen his mighty antagonist. Others showed the improbabilities of the case. M. Hanotaux tells us that the meeting had been arranged for in 1878, and that Gambetta suddenly, almost at the last moment, changed his mind, thinking apparently that in the turn things were then taking the possibilities of gain through an adjust-

ment of French and German policy were not sufficient to justify the risks of injury to himself, which the interview, if it became known, might bring.

There are in this volume some other portrait-sketches of an interest only second to that which Gambetta's excites. President Grévy is painted with a keen and distinctly unfriendly hand. His gifts could not be denied, but the less attractive features of his character, his coldness and dryness, and that want of dignity and loftiness, which the head of a great state ought to possess, are dwelt upon. M. Hanotaux thinks his election to the Presidency was a mistake and that Gambetta ought to have been chosen. He does not convince us. The qualities which evoke enthusiasm are not always those which call forth the sort of confidence and sense of stability which were needed, at the moment when MacMahon resigned, in the person who should succeed him and hold all Republicans together. Grévy excited less affection, or admiration, than Gambetta, but also less jealousy and suspicion.

The comparatively brief sketches of Bismarck, Gortchakoff, and Schouvaloff do not add much to what students of the time already know. Those of Lords Beaconsfield and Salisbury present a picture which is neither complete nor correct. But where M. Hanotaux is on his own soil and has ample materials, his delineations can be delicate and instructive. Such is that of Freycinet, the capable and resourceful man who never did anything brilliant, never made a mark, either as speaker or thinker, or as leader, yet constantly came to the front, because he had so many gifts as an administrator and so much adaptability for Cabinet and Parliamentary purposes. Two other men who figured largely in those days, Jules Simon and Jules Ferry, are also touched in with a careful brush. No recent historian has realized better than M. Hanotaux how much difference in the evolution of events the personality of men makes. Whatever be the case in America, personality seems in the Old World to count for just as much in a democracy as it used to do in the despotic monarchies, though the persons who make the difference are, no doubt, more numerous. Strong as is now the sweep of what are called the "secular forces and tendencies," there has not been a moment during the last forty years in the chief European countries when the removal of two or three men in each country would not have powerfully affected the form and direction those forces were taking. Specially important for the peaceful triumph of the republican principle in France was the character of Marshal MacMahon. He was himself in principle a monarchist, and in religion a Roman Catholic. His wife was more fervent than he in both these respects. His personal friends were nearly all of the same color. A less upright and loyal man, a more personally ambitious man, would have played the rôle, if not of Oliver Cromwell, at least of Gen. Monk, and would have carried through a *coup d'état* in favor of monarchy, for which it would have been perfectly easy to find pretexts. But MacMahon's honorable instincts repelled all such suggestions. He accepted ministries most distasteful to his own feelings, and when the action they proposed for his guidance became too repellent, he quietly resigned.

In this last volume, M. Hanotaux's style retains all its vivacity and its finish. One propensity, visible in the earlier volumes, becomes more pronounced, and, indeed, too pronounced, in this one: the love of epigrammatic phrasing. In some of his epigrams, though the words sparkle, the sense is dark; in others, the glitter scarcely conceals a platitude. Although the translation is well executed, it may be that, in some of these instances, the expression has suffered a little in passing into English from a language which, like French, seems to invite epigram. Nevertheless, the tendency to state obvious things in a highly wrought way has in this volume come near to becoming a mannerism. Some critics may complain that in the sketches of men and the dramatic treatment of situations, the graver underlying elements of politics receive too little attention. In such a criticism there would be truth, but it may be suggested that the time has scarcely yet arrived for a philosophic investigation of underlying causes.

It is with regret that we part from this animated narrative of events fateful for France and for Europe, which so intelligent and well-informed an observer has given us. It is all the more valuable because the events are so near our own time that all but the best memories, outside France, have forgotten the details. M. Hanotaux has probably done well to close at a time so far distant that the vehemence of party feeling regarding the chief actors has subsided. Of those actors hardly any are still upon the stage. But we cannot but hope that he is even now composing a sequel, bringing the story down to the beginning of the present century, which may, in another ten or fifteen years, be given to the world. The historian who comes fifty years hence to this subject will be grateful for the light which this contemporary observer, who knew the men and remembers the impressions of the moment, gives here, and will (we hope) give again, with so much grace and vigor.

CURRENT FICTION.

The White Prophet. By Hall Caine. New York: D. Appleton & Co.

An "author's note" prefixed to this volume states that, contrary to opinions drawn forth by its serial publication, the narrative "is intended to be read as a work of fiction only." The allegation has been that real persons and events in recent Egyptian history are here shadowed forth: a supposition not likely to be disposed of by Mr. Caine's rather elusive disclaimer. However the story may be intended "to be read," few readers will doubt that it was intended to be in some sense a portrait of the thing as it is. The phrase recalls a couplet aimed at Mr. Caine some years ago by a witty rhymester:

He sits in a sea-green grotto with a bucket of lurid paint,
And paints the thing as it isn't for the God of things as they ain't.

This enthusiastic novelist's verisimilitude could hardly be conceived as of actionable quality. In fact, he is a moralist, not a story-teller. He is not of those who present and interpret human life and character in the concrete. He deals in problems and situations; and his fictions are a series of elaborate parables. But a parable should not be elaborate; to clothe itself in the trappings of realistic fiction is to deny its birthright. However sound the moral of the present fable, the persons and incidents of it are preposterous. Great events and heroic emotions are understood to be involved. Not only the fate of Egypt and of England in the East, but the fate of Christian civilization is supposed to hang in the balance.

The chief figure is Lord Nuneham, British Consul-General at Cairo, and virtual despot of Egypt. After many years of power, he has become purely arbitrary in the expression of his authority. He has only contempt and distrust for the native character. His son, a brilliant young soldier who has grown up in Egypt, has a very different point of view. He loves the Egyptians and their land, and has faith in her possible future as an independent nation. He is a colonel, second in command of the British army of occupation, and betrothed to the daughter of his superior officer. News comes of a later Mahdi among the Mohammedans, who is said to be stirring up sedition. Nuneham has dismissed the Khedive from Egypt as a suspicious character, and now makes up his mind that this ranting Arab, Ishmael Ameer, is a new danger to be put down. The son, Col. Lord, is ordered to Alexandria to attend to the matter —that is, to apprehend the new popular leader, and bring him, practically a prisoner, to Cairo. But Lord does not find the Arab a mischief-maker or political aspirant. He is a prophet of spiritual truth, quite as bitter against the

degeneracy of Islam as against the corrupt European civilization which the English have imposed upon Egypt. He is bent upon the regeneration of the modern world, not upon the triumph of any creed or faction. His doctrine, his spirit, are strikingly like those of the Christ whom Western nations profess and fail to follow. The young soldier returns to Cairo not only without the expected captive, but as his expressed admirer. The Consul-General and the commanding officer are furious. Lord is given a command which his conscience forbids him to obey. Degraded and threatened with a court-martial, he leaves Cairo. From this point on the incidents of the plot are fantastic and melodramatic. The account of them is drawn out to the point of tedium: Mr. Caine has a habit of dwelling interminably upon his facts without really illuminating them.

A Charming Humbug. By Imogen Clark. New York: E. P. Dutton & Co.

It is extraordinary that wealthy heroines who go as substitutes for governesses in fiction continue to assume the names of the parties of the first part, instead of taking fresh ones. It is, of course, a practice helpful to the intricacies of a plot, and one that contributes heavily to its improbabilities; but as a device it grows nearly as shopworn as the gun that isn't loaded. For better or worse, we are in for it in the story of "A Charming Humbug." Then we go on to meet that ancient foster-child of fiction, the little-boy-in-love-with-his-governess who intends to marry her "when he is a man"—who at the first interview decides that her name, her purloined name, is "stiffish," and is made happy by her confiding to him for his use "a little heart-name the people who love me call me." This is the sort of boy who, for the most part wallowing properly in slang, has moments when he likes "verses with a run-up-and-down-your-back feeling in 'em"; and who in the early morning drive expresses his love of nature thus:

> It kinder chokes a fellow, don't it? Chokes him up till he finds out how ripping it all is. Ain't you glad to be alive in this bully old world, Gay?

In continuation there must be found room for the gentleman guest who devises ways of being with the governess and the boy, and so on to the predestined end. There is little to separate the story from its kind, excepting in the episode of the true governess's clerical fiancé coming upon the scene and precipitating disclosure. For the sugary and the pert that go to make such tales, this one fully equals the average; and for elaborated conversation addressed to an unseen gallery, it is perhaps beyond the required standard. In its case, as in theirs, it all results in a harmless and reasonably amusing little novel.

The Patience of John Morland. By Mary Dillon. New York: Doubleday, Page & Co.

The Muse of History will some day arise and demand an accounting from the novel writers. That day draws near, one must think, when with Andrew Jackson's administration for background and with the cabals of his Cabinet for accompanying fife and drum, the affair of Peg O'Neal and Major Eaton is spun out into a checkered love story, as full of blushes, rogueries, curled eyelashes, woman's wiles and man's misgivings as any mushy "storiette" of the periodical. Mrs. Dillon avowedly stirs fiction-stuff into the making of her hero and heroine, easing her own attitude in the matter by giving them new names. Peg O'Neal becomes Kitty McCabe. Her first husband is changed from Timberlake to Sutherland; and her second, Major Eaton, Senator from Tennessee and Secretary of War, figures as John Morland. He it is who has the patience; he who saves Kitty from an elopement, endures her whims, befriends her and her drunken husband, and is at last rewarded by her hand, only to be plunged into the social embarrassments which helped to make the history of Jackson's first Cabinet. The disguise of names does not extend to the other characters and thus we walk in and out on terms of affable familiarity with Jackson, Calhoun, Adams, Van Buren, Webster, and Clay. The result is as to fiction a readable but rather commonplace showing of girlish caprice and long-suffering chivalry; as to history, a group of names, a list of policies, a mirror of costumes, and a few scenes. Almost desirable, if the historic novel is to persist, is Miss Mühlbach's candid habit of indicating each fact by an asterisk. The chief merit of the type after all, and by no means a small one, lies in its sending an occasional reader to the real thing.

A Slight Indiscretion. By N. Y. Homer. New York: Cochrane Publishing Co.

"N. Y. Homer" is a prophet of vivacious and cynical humor who speaks with the tongues of drummers, and has an honest ambition to record things as they are. American novelists as a rule (says he) blink the facts. They are afraid to concern themselves with the divorce and murder, which, as every newspaper reader knows, are the staples of modern life. Not so our Jeremiah: he has kept his eyes open, and his utterance has no uncertain sound. His story is, he declares, to be "a story of to-day, as we all see it among the high and low, the rich and the poor, the virtuous and the vicious; a story of life as it really is in this, the grandest country the sun ever shone on." Its hero (and martyr) is introduced as the proprietor of a rural variety store. "He was liked by all with whom he came in contact; and his lady, well, she was hardly to be mentioned the same day with other women." But the lady in course of time proved frail; acquired a lover, who murdered her husband, married her, and played the villain in the stock market to his own eventual undoing. Justice is visited upon the murderer and his wrongly acquired "lady." She takes poison and he, not long after, is shot. Observation less biased by the testimony of the newspapers affords, it may be, a more trustworthy basis for the interpretation of American life; but the present attempt is not without its instructive and even engaging aspects.

POETRY AND LIFE.

Fleet Street and other Poems. By John Davidson. New York: Mitchell Kennerley. $1 net.

John Davidson's unhappy end gives this last book of his a special interest, and, indeed, it is in this case his death which offers criticism the better text of the two. For while there are poets whose poetry is something substantive and substantial in itself, there are others whose work is rather the complement of their sufferings and misfortunes, acquiring significance largely from their immanence in it, as a lake takes its light and color from the sky. While one creates of his superfluity and leaves his creation alone to take its chances; the other labors to eke out his own existence and to repair in imagination the short comings of reality. It is to this latter class that John Davidson belongs. In spite of much good, though curious, verse, without which we should be the poorer by a thing unique, the appeal of his poetry draws very much upon the humanity of its author—one, as he says with evident reference to himself,

> Who could rehearse
> Unheard-of things; whose thoughts were gray
> With travail, and whose reason scarce
> Escaped the onslaught of the universe:
>
> Yet one who waged an equal strife,
> And, unsubdued, beyond the sad
> Horizon of terrestrial life
> In noisome cloud and thunder clad,
> And death-cries of the past that bade
> Repent, above the galaxy
> Enthroned himself; and, sane or mad,
> Magnanimously claimed to be
> The soul and substance of eternity.

Such is the *Dichtung*, the poetic spell he tried to throw around his life. In respect to the origin of his inspiration, it recalls the words of Browning's Caliban:

> Thinketh it came of being ill at ease;
> He hateth that he cannot change his cold
> Nor cure its ache.

But for all its perversity—and that there is a kind of artistic and moral perversity about it, cannot be denied—it is by no means commonplace or ignoble. The difficulty is that such a vision is impossible nowadays even as a literary convention. The contrast with *Wahrheit* and reality as it appears in moments of depression is too irksome to be endured. Hence it is, perhaps, that the sardonic spectres of actuality, dissolvent of illusion, in its crudest and most typical aspects—the mob and the complacent vulgarian, together with their favorite places of repair, the railway station and Crystal Palace, and the like—come more and more to haunt his consciousness and at once revolt and fascinate him. In particular, the intent of his ironic exhortation to the bricks of Fleet Street is unmistakable—

> Such an enviable fate
> As that of any single solid brick
> In Fleet Street, London, well and truly laid,
> A moulded, tempered, necessary brick
> In that most famous faubourg of the world,
> Exceeds our merits! Could we but attain
> The crude integrity of commonplace
> Cohesion even in the most exhausted, most
> Decrepit, ruinous, forgotten orb
> In some back alley of the Milky Way,
> How happy we should be!

It is the same story of the two worlds of dream and reality and the chill awakening as is told in the melancholy words of his advertisement, spoken in his own person:

> The time has come to make an end. . . . I find my pension is not enough; I have therefore still to turn aside and attempt things for which people will pay.

There is, no doubt, much human stuff of superior quality which refuses to lie in regular courses; but alas for its happiness in a world of four-square—"the hell of the unfit"! And when sickness and misfortune are added to these moral irregularities, the problem is insoluble.

But this is not all. There are compensations for him who is willing to pay the price—and compensations, we may judge, of no mean order. There may be an exaltation even in defeat which raises such a nature to an outlook above that of ordinary vision:

> When, naked, I wrestled with Fate,
> The Destinies trampled me down;
> I fought in the van and was great,
> And I won though I wore no crown,
> In the lists of the world; for Fate
> And the Destinies trampled me down—
> The myrmidons trampled me down.

This is the better Davidson—not the mutineer, the *révolté* of "Cain," with its wanton reversal of accepted values and its vicious confusion of achieved distinctions, but the remote and disinterested observer of men, the satirist ironic and yet not wholly ungenial, the seeker of the picturesque in unlikely places, the riddler of cosmic riddles. It is for this singular combination of authorship that we should rather thank the poet's thwarted sensibility—the sort of thing that finds expression imperfectly in "Two Dogs" and with characteristic fulness in the fifty and five gutter-merchants of "Liverpool Street"—

> Their eyes were fire, their wrinkles changed
> To shadowed sculpture in the brute
> Effulgence of the windows, ranged
> Together closely, foot by foot,
> Like giant marionettes, as mute,
> As quick and as mechanical,
> Fronting the shops, they made their suit
> By signs alone; and each and all
> Unhuman seemed, austere, asexual.

Life of Fricdrich List, and Selections from His Writings. By Margaret E. Hirst, with an Introduction by F. W. Hirst. New York: Charles Scribner's Sons. $2 net.

List is an economist whose literary reputation has lagged far behind the immense practical influence he exerted. The prophet of the German Zollverein and the German railway system, his works are not infrequently rated with those of second-class economists, when indeed his works are not forgotten altogether. Such an anomaly is largely righted by this vivacious story of his life, and sane appraisal of his writings. Peculiarly incisive is the verdict upon the American influences which mirrored themselves in his crowning work, the National System of Political Economy.

List was a striking type of the fiery political refugee whose race has seemingly become extinct. Advanced early in life by the favor of the Würtemberg minister Wangenheim to a professorship at Tübingen, he was elected a member of the Representative Assembly, and flung himself boldly into the struggle for internal freedom of trade. Prussia alone at the time had sixty-seven different internal customs barriers, imposed duties on over twenty-seven hundred articles, and supported a customs force of eight thousand officials. List's activity in this project brought him into disfavor, and, being condemned in a judicial action, he suffered imprisonment, and eventually, with his family, went into exile. In 1825, he reached America, led to our shores partly through his acquaintance with Lafayette. He settled in central Pennsylvania, experimented at farming, and, failing therein, began the promotion of coal mines, railways, and canals.

It was while in this country that he first clearly elaborated his distinction between national and cosmopolitan economics. He afterwards developed the idea in his National System. For a primitive community, he taught, free exchange is dictated by the necessity of awaking the torpor of the inhabitants. Next a dose of protection is to be accorded to develop infant manufactures. Finally when these industries are mature, they are to be exposed to world-wide competition under free trade in order to maintain their virility and excellence. What List wholly left out of his reckoning was the emergence of industrial monopoly on the one hand, and the dogged selfishness of industrial interests which have once tasted the blood of consumers exposed by a tariff. As Mr. Hirst says in his introduction:

> Had he lived another half-century to see the American tariff on worsteds and woolens raised higher and higher . . . he might have begun to question the working value of his theory. Instead of tariffs falling as industries grow, colonial, American, and European experience tells us that the reverse is usually the case.

List's lasting influence for good was in securing internal free trade and the German network of railways.

List was "an inveterate visionary," a "born journalist and agitator." His style was vivid, pugnacious, direct, and sometimes slanderous (p. 124). With all its faults his work has a singular charm. He was impetuous to the last degree. Wolfgang Menzel's description is cited —"his short, squat body . . . crowned by a disproportionately large and lion-like head. His eyes sparkled, thunder played round his fine brows, and his mouth was as fiery as the crater of Vesuvius." His was a romantic figure, and his violent end was almost an inevitable climax to his career. The author's presentation is well executed. We have discovered but a single error, where 1787 is given (p. 38) for 1789, as the date of the first Tariff act.

Introduction to Early Welsh. By John Strachan. London: Sherratt & Hughes.

Welsh Medieval Law. By A. W. Wade-Evans. New York: Henry Frowde. $2.90 net.

The early Irish language and literature have received in general more attention from scholars than the early Welsh, but several important works of the past few months may be said to restore for the time being the balance between the two branches of Celtic philology. In the current *Heft* of the *Zeitschrift für Celtische Philologie*, Prof. Ludwig Christian Stern has published what must be reckoned the best critical study yet made of the works of the great fourteenth century bard, Dafydd ap Gwilym; and almost simultaneously with his important article there have appeared in England two works devoted to the Welsh language and law.

There is especial cause for satisfaction in the fact that Professor Strachan's work had been carried far enough, before his lamented early death, to be saved to scholarship. The author, in keeping with what we have already suggested is a common practice of Celtic

specialists, devoted his earlier studies chiefly to Irish, and was recognized as one of the foremost authorities on Irish historical grammar before he undertook the extensive treatment of Welsh linguistics. The present volume was put together with great rapidity during the last months of his life, and bears here and there marks of incompleteness. But it presents a systematic survey of early Welsh grammar, the first to be published since the "Grammatica Celtica" of Zeuss; and Celtic scholars are fortunate in receiving so important a work from the hands of an acknowledged master. The texts which accompany the grammar were selected chiefly to give practice in reading, but they include some hitherto unprinted manuscript material, and they are admirably edited. The glossary is a welcome addition to the scanty lexicographical resources of students of mediæval Welsh. The whole work has been brought out under the supervision of Prof. Kuno Meyer, who has discharged his part, it need hardly be said, with the competence of a scholar and the fidelity of a friend.

Mr. Wade-Evans's book is chiefly of value as supplying students of Welsh literature and institutions with a scrupulously careful text and translation of one of the law-books of the code ascribed to Howel Dda. In the older edition of the "Ancient Laws," by Aneurin Owen, the text was an amalgamation derived from several versions. But the present editor has adhered to a single manuscript tradition, that of MS. Harl, 4533, which is, according to the excellent authority of Mr. Gwenogfryn Evans, the oldest and most important representative of the so-called "Book of Cyfnerth," or Gwentian Code. It is to be hoped that the other books, or local codes, may be made similarly accessible. Mr. Wade-Evans's translation, as he himself says, is necessarily tentative in many places. His introduction contains a careful account of the various manuscripts of the different law-books and a brief sketch of Welsh history from the departure of the Romans down to the reign of Howell the Good. The historical doctrines presented are, some of them, to say the least, heterodox, and should be received with caution. For fuller arguments in defence of views which depart from received opinion, and which are rather dogmatically set forth in the present volume, readers should consult Mr. Wade-Evans's articles in the *Celtic Review* (Edinburgh) for 1905.

The Christian Doctrine of God. By William Newton Clarke, D.D. New York: Charles Scribner's Sons. $2.50 net.

Something over twenty years ago, after a period of long barrenness in the field of systematic theology in both Great Britain and America, there was discovered a privately printed volume of outlines of Christian doctrine, which surprised and delighted by its originality and force, its discerning insight and gentle persuasiveness. The author was found to be a Baptist clergyman, then past middle life, who had been impressed into the service of a theological school as temporary instructor in dogmatic theology during the illness of the regular incumbent. These outlines were seized upon by teachers who felt that Hodge, Shedd, and Strong were wofully out of touch with the times, and yet who had no comprehensive treatise, alive to modern difficulties, to put in their place. Here at last was a systematic theologian capable of doing thorough justice to every phase of orthodox doctrine, yet a man of the present age, aware of the necessity of reconstructing nearly every chapter of the church's working creed.

Of course, such a book could not be hid. Expanded and revised for general use, it was published under the title "Outlines of Christian Theology," and immediately fell into high favor among moderate men of all communions, both at home and in Great Britain. One who chanced to be travelling in Wales the summer after it was published found it even in the bookstores of remote villages. It is safe to say that no work concerning Christian doctrine of the last twenty years has had a wider or more wholesome influence. There is no book which can be put into the hands of one inquiring about any phase of Christian belief with better prospect that he will find his difficulties met, in the form in which he sees them, with a spirit of honest candor, and with no small portion of clear, resolute thinking.

Dr. Clarke was not released from his *pro tempore* professorship. Until the last year or two he has taught continuously at Colgate, and lectured both in England and America. His best work, however, is done by the pen, and his occasional lesser volumes, such as "The Use of the Scriptures in Theology," "Can We Believe in God the Father?" have performed useful service. It has long been known that he was engaged in the preparation of a work on "The Christian Doctrine of God" for the International Theological Library, and high expectations have been held as to the character and value of the work. These hopes are now justified. The book in hand is easily Dr. Clarke's *magnum opus*. The theme gave him a great opportunity, suited to his temperament and to the particular quality of his personal faith. The time is ripe, as many have been saying, for constructive work in theology. The religious life, of which doctrine is the outgrowth, is notably richer, sweeter, and saner than that out of which the older theologies had their rise. Criticism has exposed a thousand errors, and made it easier to avoid unfounded presuppositions. Sensitive to the good in both the old and the new, and responsive to the needs of the present, avoiding haste in preparation, Dr. Clarke has contributed to Christian thought an eminently reverent, thorough, and wise presentation of the best Christianity has to offer as conviction concerning God and His relations to the universe and to men.

The book is not an essay in theism. It is not a philosophical discourse on the grounds of theistic belief and defence of its reasonableness. It is not a summary of biblical teaching concerning God, nor a criticism of the classical Christian symbols in so far as they attempt to define the divine attributes. One is struck by the absence of reference to other writers in a work of such large compass, which handles the favorite theme of numberless theologians and philosophers. After a careful reading Paley is the only author whose name one remembers to have seen in the entire discussion. It is evident that the work is not controversial—the spirit as well as the form is irenic, and one would as soon think of quarrelling with the first Epistle of St. John as with Dr. Clarke's essay. "We shall encounter views of God that we cannot accept," he declares; "we may leave them, but we need not stay to slay them. The views of him that we accept should be borne in upon our souls by the tide of a mighty peace, and received in a calmness that has small place for controversy. The doctrine of God will fight its own battles, and the best that we can do for it is to set it forth."

It is a fair review of Dr. Clarke's volume to say that he sets forth the Christian doctrine of God in this devout and gracious spirit. By that doctrine he means the conception of God for which Christianity now stands, that view of Him which "Christian faith and thought propose for the present time, in view of the Bible, and of the history, and of all sound knowledge and experience, interpreted in the light of Christ the revealer." He sets forth the sources of this idea of the divine being, in the ancient ethical conception of the Hebrew prophets, in the life and teaching of Jesus, and in the growth of Christian thought and experience. He is bold enough to maintain that much that is truly Christian has come to light and full force since the Galilean life and the days of the Apostles. He sets aside, without rancor but with firmness, much that has maintained itself as Christian with high authority. He does not argue, he is at no great pains to defend: he declares with the beauty of simplicity the sublime faith in the beneficent ruler of the universe to which heroic souls have been led under the mastery of him who taught the world to pray "Our Father."

The Hand-Book of Alaska: Its Resources, Products, and Attractions. By Major-Gen. A. W. Greely, U. S. A. New York: Charles Scribner's Sons. $2.

Alaska has been so remote, and in many parts so inaccessible, that to the present day trustworthy data as to what it really is and contains have been hard to obtain. At the time of its acquisition it was generally believed to be an ice-bound uninhabitable waste. Some enthusiastic writers now paint it as a veritable Garden of Eden in its beauty and productiveness. Between these extremes have come representations of the most varied character as to its availability for human uses. To the too often untrustworthy Alaskan literature Gen. Greely's book is a welcome contribution. One of the most accomplished and experienced officers of the army, he has had extraordinary opportunities for becoming acquainted with far Northern conditions. He has been head of the signal service, twice military commander in Alaska, a frequent visitor almost since the date of its cession by the Russians, not only a most intelligent observer, but an efficient agent in the country's development.

The book presents usually only facts and statistics, devoid of glamour. What wealth has been amassed by miners, farmers, fur-hunters, fishermen, and traders, is stated in figures taken from official documents. "Moderately successful" is a frequent phrase applied to enterprises in all the various fields. Though millions have been gained, much of the effort hitherto put forth in Alaska has ended in disappointment. But while Alaska, as compared with many other areas of the United States, has a heavy handicap, it possesses unmistakably vast resources. As to one thing only does Gen. Greely allow himself superlatives—the magnificence of the scenery: for this he holds that the world elsewhere has no parallel. Modestly disclaiming for himself the power to describe, he quotes many glowing passages from others, endorsing as simply correct portrayals what the world has been disposed to think extravagant.

We have read with especial interest Gen. Greely's account of the native population, among whom the Eskimos and the Aleutian Islanders are rude races unusually endowed with capacity and attractive qualities. It is painful to know that up to the present, white men have sought them mainly "for exploitation and debauchery"—a contact under which their numbers have dwindled and their character deteriorated. The land and sea animals upon which they depended for subsistence have been pursued by the newcomers almost to extermination, while liquor and licentiousness have done among them the usual devil's work. Gen. Greely speaks cordially, however, of the work of the missionaries, of the educational work of some of the commercial companies, and gives a consoling picture of how the government, by successfully introducing the reindeer, is to some extent making good the destruction of the whale, walrus, and the seal.

Notes.

"The Short Story in English," by Prof. Henry Seidal Canby of Yale, now in press, is intended to be a critical guide and an historical account. The publishers, Henry Holt & Co., also announce for publication this autumn "Masters of the English Novel," by Richard Burton, professor of English literature at the University of Minnesota.

John Davis's "Travels of Four Years and a Half in the United States of America (1798-1802)," which will be published next month by Henry Holt & Co., has been described as the only book of the period written by a traveller in the United States, the object of which is not so much statistics as pure narrative. This is not so remarkable when we remember that Davis was a novelist and a friend of Brockden Brown. The travels described extend from New York to South Carolina. This is the narrative of which Trevelyan wrote in his "American Revolution": "An exquisitely absurd book, which the world, to the diminution of its gayety, has forgotten."

Prof. W. J. Ashley as editor, the Messrs. Longman, Green & Co. as publishers, promise a new edition of Mill's "Principles of Political Economy" in which will be indicated, with their dates, all changes in the text reflective of variation or development in Mill's opinions.

The Putnams announce a new study of "Fernando Cortes and His Conquest of Mexico," by Francis A. MacNutt. The same publishers are preparing, under the editorship of Katharine N. Birdsall, "The Young People's Book Shelf," which is to contain some twenty volumes of verse and prose adapted to the understanding of the young, and intended to stimulate as well as to entertain.

B. W. Huebsch announces for publication this autumn a number of works dealing with the question of socialism. Thus, we are promised John Spargo's "The Substance of Socialism" and "Karl Marx," as well as Edward Bernstein's "Evolutionary Socialism: A Criticism and Affirmation," translated by Edith C. Harvey.

The issue of a second edition of Dr. George Burman Foster's "The Finality of the Christian Religion" (University of Chicago Press) gives the publishers the opportunity to announce that the second part of this work will be ready before the end of the year, and it has enabled the writer to correct typographical errors, and to restate, in a brief preface, his belief in a "free religion."

On September 18 Houghton Mifflin Company will issue the following list of books: "Robinson Crusoe," illustrated by E. Boyd Smith; "The Oath of Allegiance, and Other Stories," by Elizabeth Stuart Phelps; "The New Golfer's Almanac," by W. L. Stoddard; "Oliver Wendell Holmes," by Samuel M. Crothers; De Cesare's "Last Days of Papal Rome," translated by Helen Zimmern, and with an introductory chapter by G. M. Trevelyan; "The Elements of Military Hygiene," by Major Percy M. Ashburn.

The publishers of *Las Novedades*, a weekly newspaper of some years' standing, announce that on October 1 they will begin publication of the first Spanish daily newspaper to be issued in New York city. The name of the new newspaper will be the *Diario de las Novedades*.

Among the books to be published this month by Charles Scribner's Sons are: "The Narratives of New Netherland, 1609-1664," a new volume in the series of Original Narratives of Early American History, edited by Dr. J. F. Jameson, general editor of the series; "The First George in Hanover and in England," by Lewis Melville; "Famous Women of Florence," by Edgecumbe Staley; "Society and Politics in Ancient Rome," by Frank F. Abbott; "Universities of Ancient Greece," by J. W. H. Walden; "The Problem of Human Life," by Rudolph Eucken; "Church Unity," by Dr. C. A. Briggs; "The Mystery of Education," by Barrett Wendell; "The American of the Future," by Brander Matthews. Some of the illustrated books to be published by Scribners are an edition of "The Arabian Nights: Their Best Tales," illustrated by Maxfield Parrish; W. H. Wright's "The Grizzly Bear"; C. W. Murlong's "The Gateway to the Sahara"; and, for younger readers, "The Story of Rustem, and Other Persian Hero Tales," by Elizabeth Renninger; "The Boys' Catlin," and Dan Beard's "The Boy Pioneers."

Students of Swift will appreciate "The Battle of the Books," edited by A. Guthkelch (London: Chatto & Windus; in the King's Classics). In the introduction the editor ranges over the battlefield of the quarrel between the ancients and the moderns, from Perrault and Fontenelle to Swift's "Apology," 1710. The appendix gives selections from Sir William Temple's "Essay," from Wotton's "Reflections" (both editions), from Boyle's "Phalaris," Bentley's "First Dissertation," Boyle's "Examination," and Bentley's "Second Dissertation." The notes are copious, and the bibliography seems to us exhaustive. In brief, we do not remember another English prose classic furnished with so generous an outfit. The reader has before him everything likely to throw light upon one of the most genial, yet at the same time most puzzling, of literary satires. Only at one point have we found the editor lacking. He has overlooked the interesting discovery, made twenty years ago by Feyerbrand, *Englische Studien*, XI, 487-491, that the end of the "Battle," the Bentley-Wotton episode, though printed by Swift as prose, is really for the most part in blank verse. One has only to read aloud to catch the rhythm. This metrical structure accounts for the ironical grandiloquence of the diction. The "Battle" thus anticipates Pope's "Rape of the Lock."

In condensing the narratives of Henry Hudson's biographers, Thomas A. Janvier ("Henry Hudson," Harper & Bros.) draws the conclusion that every important move in the explorer's life "of which we have record seems to have been a forced move, sometimes with a look of chance about it."

To his mind, the element of fatalism is always apparent, particularly in Hudson's third voyage, "that evidently had its origin in a series of curious mischances, and that ended in his doing precisely what those who sent him on it resolved that he should not do." This was the voyage that led to the exploration of the river that bears Hudson's name. The fourth voyage, too, suggests predestination. Hudson, detained in England, and forced to serve only under her flag, was sent out to his death in Hudson's Bay. In connection with this voyage, Mr. Janvier produces for the first time contemporary documents, which had remained hidden for three centuries in the Record Office in London. These are a valuable addition to Hudson memorabilia. Heretofore, the sole source of information concerning the mutiny which resulted in his death has been the "Larger Discourse" of Prickett, member of the Discovery's crew; now we have not only the sworn testimony of Prickett, but that of five of his mates, and the fact is definitely established that the mutineers were brought to trial, although there is no clue as to whether they were punished. From the way in which the testimony hangs together, Mr. Janvier thinks it probable that the Discovery's crew had more than a colorable grievance against Hudson, although it is apparent that the mutineers were interested in making out a favorable case for themselves.

The "Addresses and Reprints" of Moncure Daniel Conway (Houghton Mifflin Co.) form, as it were, a documentary appendix to his interesting autobiography, published some years ago. The earliest was written in 1850, when the author, a lad of eighteen, was an unquestioning participant in slavery and Methodism. His whole polemic against slavery and against dogmatic religion gives favorable evidence of his early acquaintance with what he strove to abolish; for while in each case it enabled him to speak with authority of the evils he detected, it secured for him a sympathetic understanding of his foes which bred not only amenity in debate but a sounder position than was attained by some of his fellow-crusaders. The question of dogma could not be settled like that of slavery by resort to arms, nor would Mr. Conway have had it so settled. It remained one of the great interests of his life, for he was one of the joyful, aggressive agnostics of the mid-Victorian type, and the resort to arms was indeed the point at which his attacks on injustice and inhumanity converged. All his other interests, and they were many, were congruous with this, and if some of his quarrels with folly were composed, and others grew old-fashioned, this one sufficed to keep him abreast of the generations. It was a good idea to publish these selections from a body of work that reflected so many phases of the great period of change through which he lived, and to give the public a quickened memory of a courageous and warm-hearted personality.

As a tribute to the memory of Gen. Herkheimer of Oriskany, and in honor of the two hundredth anniversary of the great outpouring in 1709, an instructor at Heidelberg has published a history of the emigration from the Palatinate ("Auswanderung und Koloniegründung der Pfälzer im 18. Jahrhundert," von Daniel Häberle). The emigration begun in 1709, and, renewed with increasing force in 1717, steadily continued; in 1757 from Würtemberg alone 1,000 emigrants came to America, and others went to Russia, Galicia, and Spain. All southwest Germany was being depopulated, and the authorities tried in vain to stop the emigration. The Palatinate, once the Paradise of Germany, gave its name to all German emigrants, so largely did it supply them. While Joseph the Second, at the request of the Rhenish princes, in 1768 forbade further emigration, Prussia, Austria, and Russia were secretly seeking to establish colonies of Palatines, and the rising tide carried many well-to-do peasants to America. In 1785 over 3,500 went into Austrian provinces, many of them *Leibeigenen, i. e.*, serfs, without leave or license, and in all over 29,000, not counting children, left the German empire. In 1749 the records show that 2,785 came to America, and year after year the number increased, carrying with them money, household effects, and such valuables as they could. Hard as was the journey down the Rhine or across France, to the seaports for the trying voyage to America, it was less severe than the long and weary land routes to Eastern Europe. The advertisements in Frankfort a. M. of Dutch emigration agents pictured in glowing terms the attractions of America, where friends and neighbors and relatives had made successful homes. Help was at last provided by the German Society of Pennsylvania, founded in 1764, by that of New York, in 1784, and that of Maryland, in Baltimore, in 1817, but much misery and suffering must have been the lot of the German emigrant. Dr. Häberle gives all of the recent American literature on this subject, and much material hitherto unused, from local archives. His account of the recent Palatine emigration to eastern Europe is of interest. A number of maps, full bibliographical references, and a good index add to the value of his book as a source of information for the growing number of students of German-American history.

The celebration of the fiftieth anniversary of the Italian war has been impressive in northern Italy, where monuments have been dedicated on several battlefields, and Italian and French veterans have reassembled. The Italian journals have printed many articles, historical or reminiscent, some of which possess more than passing value. One book, at least, deserves to be mentioned, because it gives the best popular account of the diplomacy which led to the French alliance and a vivid narrative of the brief, brilliant campaign. This is "Il 1859, da Plombières a Villafranca" (Milan: Fratelli Treves), by Alfredo Panzini. Signor Panzini draws from the most authoritative sources, French and Italian, and has the art of telling a story without vitiating its value as history. For an introduction, he presents two impressionist studies of Cavour and of Napoleon III, and a sketch of Italy's condition before 1859. Several welcome announcements also come as an aftermath of the celebration; the Italian War Department is to publish in full the official report of the war; the journal of an aide-de-camp, hitherto printed anonymously in fragments, by Chiala, is to appear uncensored; and Signor Alessandro Luzio has ready a new volume of essays. The aide-de-camp's diary, usually attributed to Robilant, is of great interest and has been much used by historians for the intimate reports it gives of many significant episodes. It is to be hoped that now it will be printed without the suppression of any names or statements.

An ambitious and successful book for the purpose of instruction in the French language appears in two volumes belonging to the Oxford Modern French Series, under the general authorship of Lèon Delbos (Henry Frowde). Michelet's "Jeanne d'Arc," edited by H. Sacret, is provided with a scholarly introduction, certain to stimulate the reader's interest in the text; and with notes, mostly historical, which serve to correct Michelet's inaccuracies and Anglophobia. Two maps illustrate the politics and the campaigns of Jeanne's time. Intended for students who read French with some facility, the volume will appeal especially to those who in preparation for college or otherwise have studied De Quincey's "Joan of Arc," which attacks this very book of Michelet's. In the same series, Sismondi's "Pavie et le sac de Rome" (part forty of his "Histoire des Républiques Italiennes") is edited by Arthur Wilson-Green. Both introduction and notes, otherwise commendable, are marred by the employment of French forms for proper names in an English context, and by the awkward use of French English.

The literary remains of Detlev von Liliencron are to be edited by Richard Dehruel. The first volume to come out will be a collection of short stories, a number of which appeared on special festival occasions in the Vienna *Neue Freie Presse* during the past three years. The several volumes will appear under the title "Gute Nacht."

No. 5107 of the Reclam'sche Universal-Bibliothek consists of a beautiful translation of six short Armenian stories by Arvetis Aharonean, done into excellent German by Agnes Finck-Gjandschezian. These stories all deal with the sufferings of the Armenian people under the oppression of the Kurds and the Turks. The Armenian author, born in 1866 in Igdir, is the literary editor of the Armenian monthly *Mudtsh*, published in Tiflis, and has in recent years become popular through his numerous Armenian stories.

Henry B. Blackwell, who died in Boston September 7, at the age of eighty-four, had been for many years a prominent advocate of woman's suffrage, as he was likewise one of the few surviving militant abolitionists. Born in England, but brought to this country by his parents when only six years of age, and soon left an orphan in a family of nine, Mr. Blackwell was early thrown upon his own resources, as were, in some degree, his sisters, Dr. Elizabeth Blackwell and Dr. Emily Blackwell, who were among the first women to enter the professional life. When one adds that in 1855 Mr. Blackwell married Lucy Stone, one of the earliest as also one of the bravest of woman-suffragists, it is evident how close were the ties which bound him to the movement; and how natural it was that he should succeed, after his wife's death, to the editorship of the *Woman's Journal*, founded in Boston in 1870. In his editorship of the *Journal* Mr. Blackwell has been assisted by his daughter, Alice Stone Blackwell. Mr. Blackwell will be remembered also for the

active part which he took in the Free Soil movement.

William Lloyd Garrison, son of the great anti-slavery leader, and elder brother of Wendell Phillips Garrison, a founder and so long editor of the *Nation*, and widely known as a publicist, died at his home, in Lexington, Mass., on September 12, at the age of seventy-one years. Mr. Garrison engaged in business of one kind or another until 1901, but was by nature and inheritance a reformer rather than a merchant. He was, furthermore, revealed in his multitudinous addresses in behalf of free trade, peace, woman suffrage, and the single tax, as a writer of clear English, vigorous in style and cogent in statement. True to the family traditions, he was a man of unlimited moral courage with an abiding interest in every humanitarian movement the world over.

Martin Ferdinand Morris, whose death at Washington occurred on September 12, was born in that city December 3, 1834. Four years ago he retired as Chief Justice of the Court of Appeals of the District of Columbia, having been appointed justice of the court by President Cleveland twelve years earlier. Judge Morris was the author of "Lectures on the History of the Development of Constitutional and Civil Liberty," and of numerous monographs and addresses.

Mayo Williamson Hazeltine, book reviewer and editorial writer for the New York *Sun* since 1878, and a frequent contributor to the periodical press, died at Atlantic City, N. J., on September 14. He was born in Boston in 1841, was graduated from Harvard College in 1865, and subsequently studied at Oxford, and in the Harvard graduate school. Later, he read law and was admitted to the bar. His books include "Chats About Books," "British and American Education," and "The American Woman in Europe."

Prof. Heinrich Bassermann is the fourth professor of the University of Heidelberg whose loss has been recorded last month. The distinguished professor of pastoral theology, who was in his sixty-first year, was the author of a "Handbuch der badischen Gottesdienstordnung," "Ueber Reform des Abendmahls," and of other works.

Science.

Mendel's Principles of Heredity. By W. Bateson. Cambridge University Press. New York: G. P. Putnam's Sons. $3.50 net.

This is the second of Professor Bateson's works with this title, the first having been published seven years ago as a defence against certain attacks which had been made by the late Professor Weldon on Mendel's methods. In that earlier book the author presented some of his views in rather a tentative manner, and a few of these he now gracefully relinquishes. The whole subject has expanded so rapidly of late that it was quite time for a restatement of the essential factors by one who has done good service as a pioneer. In 1907 Professor Bateson delivered a course of lectures at Yale University on the general subject of genetics, the new term which covers all matters relating to the origin of living beings. In the volume before us, the Yale lectures are not presented, since they will form, with enlargement, a separate treatise. But the present work gives in a concise manner the so-called Mendelian principles, with an admirable biographical sketch of Mendel and a few hints as to the wide and numerous applications of Mendelism.

The history of Mendel's work is in itself almost incredible. Johann Mendel was born in Austrian Silesia in 1822. After a good training in the gymnasium, he was admitted to the Augustinian monastery at Brünn, under the name of Gregor Mendel. Later he studied at the University of Vienna, devoting himself to mathematics and physics. On his return to the monastery, he began the remarkable series of researches on the impregnation of plants, with which his name is now associated. His investigations covered a period of more than eight years, and the results were faithfully reported to a scientific society and published in their journal. The publication bears the date of 1866. But the memoir attracted no notice whatsoever. It remained without any recognition (except one bibliographical note in a treatise on hybrids) for more than thirty years; nor did he ever in his lifetime realize that his researches would later be regarded as epoch-making.

Now it happened in 1900 that at least three investigators came simultaneously upon Mendel's buried treatise, and found that its results harmonized in a striking manner with their own. They had thought themselves to be pioneers, but they saw that Mendel had preceded them. From that date Mendel's name has taken its place in the ranks of original investigators of the first order, where it is likely to remain. Professor Bateson, like others who have examined the total neglect of Mendel's treatise for more than thirty years, is at a loss to account for it. The reparation has been tardy, but it is complete. Professor Bateson presents a capital account of the course of events which led up to the discovery of Mendel's work. It may be worth while briefly to trace these steps, especially as the sketch discloses a fact which general readers and many special students are apt to lose sight of, and which is too often overlooked by amateur naturalists. In the first place, it must be distinctly understood that the idea of evolution is very old, and that even some of the early philosophers dreamed that existing plants and animals had sprung in some way from simpler forms. Such notions are to be met with (as Professor Osborne has well shown in his "From the Greeks to Darwin"), in a more or less pronounced form, down to the time of Wallace and Darwin.

But from the middle of the eighteenth to the middle of the nineteenth century, the scientific world was so completely under the influence of the idea of fixity of species as definitively formulated by Linnæus, that all naturalists who held a different view found it difficult to command a hearing. Some were even laughed out of court. But in the years from 1825 to 1855, there were many engaged practically in the study of horticultural varieties of plants and their improvement by crossing or hybridizing. It was natural that some of these experimenters should become extremely skeptical as to the limits and permanence of species. But there was as yet no satisfactory explanation of the origination of new species. It was at this period that the strong leading clue was given by Wallace and Darwin. As soon as the naturalists realized fully the efficiency of this clue in leading out from obscure places, it was seen that many had barely anticipated the same suggestion, and had fallen just short of it. Professor Bateson says that a number of the practical breeders, who had been working assiduously up to the time of the publication of "The Origin of Species" in 1859, continued their researches for a decade longer, and then abandoned the field. He remarks:

> In all that concerns the problem of species the next thirty years are marked by the apathy characteristic of an age of faith. Evolution became the exercising ground of essayists. The number indeed of naturalists increased tenfold, but their activities were directed elsewhere. Darwin's achievement so far exceeded anything that was thought possible before, that what should have been hailed as a long-expected beginning was taken for the completed work. I well remember receiving from one of the most earnest of my seniors the friendly warning that it was waste of time to study variation, for Darwin had swept the field.

Yet a few began to reëxamine the degrees of variation and to see whether it might not be possible to express the grades with mathematical precision. By the beginning of the present century this work in exact measurement was fully under way, and the twin sciences of biometry and genetics were attracting to their service some of the most earnest biologists. It was at the outset of this new activity that Mendel's forgotten work came, by a mere accident, to its own.

A brief account of one of Mendel's classical series of experiments will indicate the nature of his work and show why so much importance is attached to his methods and results. The word "methods" is better than "principles" in describing Mendel's contribution to science.

The genus Pisum comprises about six species, of Mediterranean and West

Asian origin. But some authors recognize only two species instead of six, a fact which shows the ambiguous character of the marks by which the species are distinguished. One of the species, by far the most common, is *Pisum sativum*, or common garden-pea, which is so extremely variable that horticulturists have long since ceased to keep count of the commercial varieties, except those which are in present use. Every seedman's catalogue contains a memorandum of some of the well-established sorts, together with the newest aspirants to favor. Mendel recognized the suitability of this common pea, and its nearest relatives, for a study of inherited characters. In the first place he says:

> The experimental plants must necessarily (1) possess constant differentiating characters, and (2) the hybrids of such plants must, during the flowering period, be protected from the influence of all foreign pollen, or be easily capable of such protection.

Pisum plants answer these two conditions: they have a few characters which serve to separate the different forms, and they are practically self-fertilized. Plainly, then, we have in Pisum a blossom which can be studied from two points of view, namely, under conditions of self-pollination or self-fertilization, and of cross-fertilization, since we can let it alone or we can transfer the pollen artificially from one plant to another. And this is what Mendel did. For two years he "tried out his plants,' so to speak, until he had procured some which "yielded perfectly constant and similar offspring: at any rate, no essential difference was observed during two trial years." Upon, different specimens of this comparatively constant material, he experimented by all sorts of crossing and hybridizing.

How did Mendel's work differ from that undertaken by many before and at his time, so that it has taken such a commanding position? Perhaps it is in this chiefly: (1) He selected the parent-plants with great definiteness; (2) he carried on his studies on a large scale and over a long period of time; (3) he kept most careful records of the pedigree from start to finish; and (4) he compared his results with the design of seeing whether such precise figures in regard to form, color, and so on, might not exhibit definite relations. He was so fortunate as to detect certain ratios. To illustrate these ratios, a simple case described by a recent writer may be cited:

> Rose Bantams are of two kinds, blacks and whites, and pure strains of either kind breed true. Now cross the black with the white. Instead of being of an intermediate color, the offspring are all black like the black parent. For this reason, black is said to be dominant to white, which is spoken of as recessive. When the hybrid blacks are bred together, they produce blacks and whites in the proportion of three of the former to one of the latter. The whites so formed, thenceforward breed true, and produce no blacks, in spite of their black ancestry. The blacks, however, are of two kinds—(1.) pure dominants, which give only blacks when mated with a white bird, and impure dominants, which behave like the original hybrids when mated together, giving blacks and whites in the ratio of three to one. Moreover, such birds when crossed with whites may be shown experimentally to produce equal numbers of blacks and whites.

This simple case taken from the zoölogical side, stands as a type of the innumerable instances studied by Mendel, in the garden at Brünn. Repetition after repetition has only confirmed the discovery by Mendel and thrown light upon this the most obscure of biological processes. The Mendelian ratios occasionally fail in practice, but serve nevertheless as the basis of a provisional principle, upon which one may select new material for the obtaining of definite results. Such suggestive work is a distinct contribution to science, and its general results are likely to be wide and very useful. Professor Bateson has indicated some of the lines on which the new suggestions can develop, and he has presented the subject in a clear manner. We must wait for his Yale Lectures in a published form for a further amplication of these useful suggestions.

One thing will strike every reader of Bateson's work, namely, the indifference of Mendel to the limitations of species. Mendel's expression, as translated by Bateson, is:

> It has, so far, been found just as impossible to draw a sharp line between the hybrids of species and varieties as between species and varieties themselves.

Since Prof. Carl Zehden of the Handels-Akademie of Vienna published the first extensive treatise on commercial geography in 1871, nearly forty text-books have appeared in this comparatively new field. Of these, twelve were published in the United States, an equal number in Great Britain, seven in Germany, while the remainder may be assigned to France and Italy. In view of the recent extension of the study of commercial or economic geography in the colleges and universities here and abroad, the recent revision and enlargement of "A Handbook of Commercial Geography," by George G. Chisholm (Longmans, Green & Co.), the only text-book in the English language adapted to the needs of the college student, is a matter of small importance. This is the seventh edition that has appeared since the work was first published in 1889. Many changes are merely matters of small detail; the really important one being the substitution of the latest available statistics for those which had become out of date in the elaborate tables in the appendix. The present enlargement consists in the insertion of an entirely new and exceedingly valuable chapter on Trade Routes, with maps showing the leading express and transcontinental railway routes in Europe, Eurasia, and North America. Besides, there is a large pocket map of the world, bearing the trunk line ocean routes, shaded so as to show their relative importance. The latter was prepared by Prof. Max Eckert, who is the author of the leading work in German on Commercial Geography.

Dr. Henry Cadwalader Chapman, professor emeritus of physiology and biology at the Jefferson Medical College, Philadelphia, died suddenly at Bar Harbor, Me., on September 7. Dr. Chapman was born in Philadelphia in 1845, and was a graduate of the University of Pennsylvania and of the Jefferson Medical College. Three years of study were also spent in Europe. From 1875 he held a curatorship in the Philadelphia Academy of Natural Sciences, of which he was for forty-one years a member. He was a contributor to the medical journals, and author of "The Evolution of Life," "History of the Discovery of the Circulation of the Blood," "Treatise upon Human Physiology," and "Medical Jurisprudence and Toxicology."

Heidelberg has lost in the death of its professor of surgery, Hermann Lossen, a lecturer of distinction and the author of several valuable books—notably "Die Verletzungen der Unteren Extremitäten," "Grundriss der speziellen Chirurgie," and "Lehrbuch der allgemeinen Chirurgie."

Drama and Music.

Charles Scribner's Sons announce for early publication four one-act plays by Sudermann, which will appear under the general title of "Roses."

Announcement is made of the plans for the first season of the New Theatre, which will open on November 8 with "Antony and Cleopatra," and will last about thirty weeks. Among the plays announced are "The Cottage in the Air," adapted from "Elizabeth and Her German Garden," by Edward Knoblauch; "The Nigger," by Edward Sheldon; "Strife," by John Galsworthy, and Sheridan's "School for Scandal." The company, when fully organized, will comprise about forty players. Among others this number will include Edward H. Sothern, Charles Cartwright, A. E. Anson, Albert Bruning, Ferdinand Gottschalk, Jacob Wendell, jr., Pedro de Cordoba, Julia Marlowe, Rose Coghlan, Olive Wyndham, Jessie Busley, Mrs. Sol. Smith, Beatrice Forbes-Robertson, and Thais Lawton. Louis Calvert, who was brought from London to produce the standard dramas, is an actor of great ability, as well as a stage director of long experience, and will appear in several important rôles. Of equal eminence in their fields are George Foster Platt, producer of modern dramas; Wilfred North and Frederick Stanhope, assistant producers; Elliott Schenck, musical director, and Edward Hamilton Bell, art director.

The production of "Macbeth" in France, not according to the artificial traditions of the stage, but amid the ruins of the abbey of Saint Wandrille, has been widely commented on by the French press. It was given before about fifty persons, the admission price was $40, and the scenes of the great tragedy shifted from room to room in the castle, or in the "deserted heath" of the grounds, following the natural order of

the events. It was that feature—the rather "precious" attempt at an art novelty—which seems to have attracted the attention of the critics. Mme. Maeterlinck, as the originator of the idea, receives high praise for tickling the taste of the æsthetic groundlings. Little, comparatively, is said about the French translation of the play, by Maurice Maeterlinck, which, to judge from some extracts given in the London *Times*, has unusual merit. He evidently has caught, at least in spots, the poetry of the original. That he realized the difficulty of his task is shown by his statement:

> The humble translators face to face with Shakespeare are like painters seated in front of the same forest, the same seas, on the same mountain. Each of them will make a different picture. And a translation is almost as much an *état d'âme* as is a landscape.

Frederick A. Stokes Company have announced for early publication a new book for children, by John Prendergast—"Great Operas for Young People." The writer has put into simple language the stories of "Faust," "Aïda," and "Lohengrin." Written to be acted by children, as the "Great Operas" have been written to be read, are Constance D'Arcy Mackay's ten short plays in verse, "The House of the Heart."

The new operas announced for production during the coming season, either at the Metropolitan Opera House or at the New Theatre, are: Blech's one-act German opera, "Versiegelt," Bruneau's "L'Attaque du Moulin," Converse's "The Pipe of Desire," Franchetti's "Germania," Goetzel's "Les Précieuses Ridicules," Goldmark's "The Cricket on the Hearth," Humperdinck's "Children of the King," which will be sung in English and produced for the first time on any stage at the Metropolitan, Laparra's "La Habanera," Lehar's "Gypsy Love," Leroux's "Le Chemineau," Paer's "Il Maestro di Cappella," Tchaikowsky's "Pique Dame," and Wolf-Ferrari's "Le Donne Curiose." Further announcement is made that exclusive producing rights for America have been bought in the case of several new operas, some of which are not yet completed. Among these are Debussy's "La Chute de la maison Usher," "Le Diable dans le Beffroi," and "La Légende de Tristan"; Dukas's "Ariane et Barbe-Bleu," founded on the Maeterlinck play; Kienzl's "Der Evangelimann," Leroux's "La Reine Fiamette," Gustave Charpentier's "La Vie du Poète," Nougues's "Quo Vadis," Ravel's "L'Heure Espagnole," and Salvayre's "Solange."

The Boston Symphony Orchestra announces its usual series of ten concerts in Carnegie Hall, New York. The dates are as follows: Thursday evenings, November 11, December 9, January 13, February 24, and March 24, and Saturday afternoons, November 13, December 11, January 15, February 26, and March 26. As stated last spring, Max Fiedler will again be at the head of the orchestra. The soloists that can be announced at this time are: Gilibert, baritone; Samaroff, pianist; Elman, violinist; Sembrich, soprano; Rachmaninoff, pianist; Schumann-Heink, contralto, and Hess, violinist. Two others will be named in due time.

Sir Francis Brady, whose death is announced from Dublin, devoted himself for the greater part of his life of eighty-five years to the encouragement of Irish music. The Royal Irish Academy of Music, founded in 1856, owed its existence to his efforts, and had his keenest interest to the last. He was the author of several songs and collaborated with Dr. Esposito and others in the arrangement of Irish melodies.

Art.

A COMING ART EXHIBITION.

On the 20th of September, as a part of the Hudson-Fulton celebration, there will begin a month's exhibition of paintings at the Metropoltan Museum of Art, which as a symptom of taste and a precedent for the future is of great importance. It is a collection of fine paintings of the Dutch school, for the most part loaned by the private owners; and comprises about thirty of the best Rembrandts, four or five beautiful Ver Meers, and several of Franz Hals's, Ruysdaal's, and Cuyp's. In addition, there are good paintings by the lesser men of the Dutch school, giving to the collection a representative character and enabling the amateur of taste to see and feel adequately the eloquence of one of the great periods of art.

The acquisition of beautiful European works of art by Americans has been too often taken as a mere manifestation of the power of money. Without money, indeed, they could not have been bought. But there are plenty of rich collectors in England, Germany, and France, who would not have grudged the money any more than have the Americans. Much greater credit is due to the American's energy and growing taste than to his pocketbook. His energy is proverbial, and perhaps some day his taste will be. The existence of a beautiful collection such as that about to be exhibited indicates that this energy and desire for the acquisition of art knowledge are extending beyond the artists to the people.

And such an exhibition is not only a symptom of the rising taste and knowledge of the community, but is a condition without which modern art cannot lift its head. Creative art is an intensely traditional thing. It connects itself at every stage with what has gone before it. Raphael would have been impossible without Perugino, and, in general, the Renaissance of Italy could not have existed without ancient models. Art is an application of known forms and traditions to the new life of the time. We often hear complaints from our artists to the effect that modern work is neglected and misunderstood, that living American artists are not sufficiently encouraged—a wail natural enough, but thoughtless, for the public cannot be expected to desire or appreciate painting, of the traditional basis of which it has no knowledge. The beauty cannot be felt, in other words, without the atmosphere. So that the bringing to America of old and new European art, far from harming our artists, is rapidly forming a *milieu* in which they may connect their creative ideas with traditional forms understood, and therefore appreciated, by the public. The new art cannot come except on the basis of the old; and first, of course, what is old and classic must be known and felt by the people.

The *International Studio* (John Lane Co.) brings out "The Master Painters of Britain," edited by Gleason White, late editor of the *Studio*. It is a picture-book, pure and simple, the text being entirely insignificant, and its interest is that of a review of two centuries of British painting. In spite of the inclusion of a few Americans, like Whistler and Sargent, the faults and virtues of the works shown are typically British. Some of these painters are artists and some of the artists are painters, but almost all of them are picture-makers, not producers of studies—that is the best and the worst of them.

We may call attention to the large amount of useful information to be found in "The Photographic Annual," which comes to us in a fifth edition, from Tennant & Ward. It has been revised and extended by the editor, H. Snowden Ward.

Gertrude Burford Rawlings's "Coins and How to Know Them" (Stokes), as a handbook for the study of numismatics, will be found useful. In dealing in one volume of 374 pages with the coinage of ancient Greece and Rome, of mediæval Europe, of the British Islands and their dependencies, and of the United States, the author had of necessity to forego all detailed descriptions. But the history of coins in these various countries affords interesting comparisons between their various products and shows in how far they influenced one other. In treating the Greek coinage Miss Rawlings has revised the geographical arrangement adopted in the standard books, such as Head's "Historia Numorum," and instead of beginning with Spain and working her way eastward, she begins with Asia Minor, then takes up European Greece and Italy, working back by way of Africa to Syria, Persia, and India. This arrangement undoubtedly corresponds more closely to the chronological sequence; but it is somewhat disturbing not to have the same order as that adopted in the standard books and museum collections, because this handbook is in no wise independent of them; it has very few illustrations, and the short descriptions of the various types are of course insufficient to give the student a clear idea of the appearance of the coins, unless he has a coin collection or well-illustrated work to refer to.

In adapting the interior of the Pantheon to its recent uses as a royal tomb, the late Giuseppe Sacconi, in 1904, removed from one of the chapels a fresco, which he attributed to that rather commonplace artist, Antonizzo Romano. Neglected for years, this fresco has recently been "pieced together" and cleaned, and now, Venturi, Corrado Ricci, and other Italian crit-

ics, attributo it to tho hand of Melozzo da Forli, and describo it as a rare and magnificent work of art. It is not yet accessible to the public, hut an authorized reproduction shows a lunette, representing the Dove descendlng in rays from God the Father, and, helow, a large Annunciation of the Virgin, in which the Archangel appears in the moment of checking his advance and half falling in reverence hefore the Virgin. His figure, rather than the Virgin's, seems to show the combination of vivacity and religious feeling characteristic of Melozzo. The next number of the *Bollettino d'Arte* will discuss, in detail, this later attrihution, and will contain several pertinent illustrations. Art lovers can hardly fail to comment upon this evidence that such treatment of an important work of art is possible in a national monument under the very shadow of the Ministry of Education, at Rome.

Profs. Georges Nicole and Gaston Darier, of Geneva, have published an account of their discoveries in an illustrated monograph entitled "Le Sanctuaire des dieux Orientaux au Janicule" (Rome, Imprimerie Cuggiani). Their excavations of last winter hrought to light the remains of two temples, one huilt ahout the beginning of the fourth century ahove that erected, as an inscription proved, at the end of the reign of Marcus Aurelius In spite of diligent research, the statuette of a goddess found in the triangular altar, or consecration stone, of the inner, octagonal cell, still remains unidentified. Professor Nicole compares it with a statuette of Gnossus, whose tiara is surrounded with serpents and recalls coins on which the Ephesian Diana is represented, like this statuette, hound in swathing clothes. The other statues are identified as Dionysus, Hades, and (that in hlack basalt) an Egyptian king, represented as a god. Attention is called to the frequent allusions in late Latin, and especially in satirical writers to the introduction of strange Oriental forms of worship at Rome; to the unusual arrangement of the cells and their entrances, and its hearing upon the secrecy of the rites; and to the evidences of persecution, which resulted in preserving intact the gilded statue of Dionysus.

Charles Follen McKim, founder of the firm of architects of McKim, Mead & White, president of the American Institute of Architects, and member of the Architectural League, the National Academy of Design, the Metropolitan Museum of Art, the Accademia di San Lucca of Rome, and of other organizations, died on September 14 at St. James, L. I. He was born in Chester County, Pa., August 24, 1847, and was the son of the well-known aboiitionist, James Miller McKim. After a year of study at the Lawrence Scientific School of Harvard University, Mr. McKim spent three years in Paris as a pupil of Daumet, at the Beaux-Arts, and two more years in foreign travel. As an architect, he played a great part in the American revival of Italian models, and received generous recognition at home and abroad. The name of Mr. McKim's firm is especially associated with the Boston Public Library, the Columhia University Library, Robinson Hall at Harvard College, the Century and numerous other New York clubhouses, J. Pierpont Morgan's library, the War College at Washington, and the new Pennsylvania Railroad station in New York city.

Jean Paul Selinger, portrait and figure-painter, died in Boston on Septemher 13 at the age of fifty-nine years. The son of a woodcarver of repute who was also one of the founders of the Boston Museum of Fine Arts, he was educated in the Boston schools, and at Stuttgart and Munich In this last city he was a pupil of Wilhelm Leibl, the master of Munkaczy.

Léon Martineau, a mural painter and maker of decorative windows, died in New York city on Septemher 7, at the age of forty-six. M. Martineau was a pupil of Luc-Olivier Merson, and was President of the Société de Peintres-Verriers, of Paris.

Finance.

CONTROL OF GREAT CORPORATIONS.

Monday's action of the Union Pacific directors, in electing Robert S. Lovett, Harriman's close associate, to succeed Mr. Harriman as chairman of the board, and in choosing as new members of the executive committee two other financiers intimately affiliated with Harriman, puts at rest for the time, at any rate, rumors of a struggle of rivai factions for control. In these reports, indeed, there was all along something of indecency; had they been correct, they would inevitably have suggested a fight over the sick-bed of a dying man for the property he was leaving. Even gossip would scarcely have busied itself with such assertions but for the curious statement, given out the day before Mr. Harriman's death by a man whom the Associated Press described as an intimate friend of Harriman, and who flatly declared that Wall Street interests, taking advantage of Harriman's absence and illness in Europe, had "assumed his career was over," "raided his property," "struggled to unhorse him," and "even announced the name of his successor."

Of the facts behind these somewhat sensational allegations, it is not easy to obtain certain knowledge. But it is at least reassuring to find that the episode, whatever its real character, has not been followed by any such open conflict of opposing interests as would nave confirmed the worst interpretations. The situation as a whole, however, suggests some reflections on the present posture of affairs in our great corporations.

It will doubtless be remarked, in the first place, that the era in which great railway systems were passed along by will to the family of the controlling financier is definitely past. Jay Gould and the Vanderbilts of the earlier generation literally owned the railways most closely associated with their names. Each selected his successor in office, reserving, indeed, the right of establishing a kind of order of succession, whereby the oldest son should succeed to personal control of the railway property, the rest of the family being commonly provided for in a trust fund. There are two reasons why this sort of family ownership and family succession is not likely ever to be repeated. One arises from the fact that, although railway properties were in these cases inherited, capacity for administering them did not always descend along with the properties. This, together with the increasing difficulty and complexity of such administration, and the necessity for dependence on large financial interests to procure the funds required for development and extension, made necessary the sharing of responsibility with outsiders. This could usually not be obtained without similar sharing of actual control and ownership.

The second reason for the disappearance of family ownership arose from the same conditions as the first. If our great private fortunes have increased rapidly since the days of such ownership, the capitalization of the railways themselves has increased even faster. Such present-day stock capitalizations as the $248,000,000 of the Northern Pacific, the $299,000,000 of the Union Pacific, the $314,000,000 of the Pennsylvania, and the $178,000,000 and $112,000,000, respectively, even of such smaller enterprises as the New York Central and the Erie, made virtually impossible continued exclusive ownership, even of a majority interest.

This rapid and great increase of capital stock, which really began with the business revival after 1898, was followed, therefore, by the era of ownership by groups of financiers. The contests between great railways in the seventies and the eighties were mainly contests between individuals, who regarded the several properties as their personal possessions. The contests of the decade past have been conducted between powerful factions. The Union Pacific-Northern Pacific struggle of 1901 was avowedly a battle between a group of wealthy capitalists known as the "Standard Oil party" and a second group known as the "Morgan party," and the prodigious sums of money raised on credit and flung into the Stock Exchange arena would have been inconceivable but for the accumulations of financial power banded together behind the two great properties.

It is this fact which lends particular interest to the situation created by the death of Mr. Harriman. It is wholly improbable that Harriman's personal ownership of Union Pacific shares was ever large enough to have carried an election. Actual ownership of the property could not be determined by his personal bequests; it depends to-day, as it did before his death, on the grouping of separate capitalists, each of whom undoubtedly owns as much of the stock as Harriman did, or more. And this,

in turn, explains why interest has converged so actively on the present attitude of this group of financiers toward the property and toward one another. That Harriman's death has removed the will and personality which dominated all the others is conceded on all hands; the question of his successor, then, is less a question of what men will be formally elected to the offices which he held, than of what man will be able to manage as he did the group of capitalists behind him.

It is quite conceivable that no one will repeat the achievement, and that the railway property over which he exercised so vital and personal a control will become an investment enterprise which no individual and no group of individuals actually owns. The Pennsylvania Railroad is a property which already occupies such a position. Itself the great prize of the American railway industry, its ownership is so widely distributed that no man or group of men can be said to possess an actual control. A very large individual investment in the shares is apt to be recognized by the admission of the owner to the directing board; the property is managed by the largest owners of its stock and by such experienced colleagues as they select. Mismanagement would undoubtedly displace an existing board, both by dissension among these larger owners and by transfer of proxies by the great mass of outside and unrepresented shareholders, who would then be driven to united action to protect their personal interests. It is probable that a status of this sort will become more common as the history of American railway finance goes on, and that we have possibly seen the last of such excesses, arising from group or faction domination, as marked the later years of Mr. Harriman's career in Union Pacific.

The Best Book On 6% Bonds

We have written a book on Irrigation Bonds, based on long experience and intimate knowledge. Every investor, small or large, owes to himself its perusal. We want to send you a copy.

In the past 15 years, we have sold 70 separate issues of Drainage and Irrigation Bonds, without a dollar of loss to any investor. We are the largest dealers in these Reclamation Bonds, and they have become, in late years, our most popular bonds.

Irrigation Bonds are secured by liens on the most fertile farm lands in America. The value of the land is often more than four times the loan.

Some are municipal obligations, forming tax liens on the real property located in populous districts.

They are serial bonds, running from two to twelve years. Each year, as the loan is reduced, the security back of the rest is increased.

The denominations are $100, $500 and $1,000, so one may invest either little or much.

The interest rate is six per cent. No other large class of bonds, equally well secured, now pays an equal rate.

These bonds are bound to become more and more popular as they become better known. They are the utmost in six per cent. bonds. Please send us this coupon to-day for our free book, so you may know the facts.

A Political History of the State of New York
VOLUME III (1862-1884)

By **D. S. Alexander.** 8vo, $2.50 net; by mail, $2.70.

This volume narrates, fully and entertainingly, the futile efforts of Weed and Dean Richmond to reorganize existing parties, the rise and fall of the Tweed Ring, Conkling's punishment of Greeley and defeat of Fenton, Tilden's defiance of Tammany and struggle with Kelly, and the overthrow of the stalwart régime by the crushing victory of Grover Cleveland. The publishers believe the author has been quite successful in making history as readable as a novel. Its fairness will appeal to the strictest partisan. Original research materially modifies previously accepted theories.

The author, now a member of Congress, has been prominent in state and national politics for many years.

Volumes I and II (1774-1861) were characterized by the *Review of Reviews* as "the most entertaining story of state politics in American History."

Circular with sample pages on request.

HENRY HOLT AND COMPANY 34 W. 33d St. NEW YORK

The Conquest of the Isthmus
By Hugh C. Weir

8vo. Fully Illustrated. $2.00 *net.*

It was to study the life of the men who are doing the work at Panama that Mr. Weir visited the Isthmus. It was not the machinery that held his attention, nor the pigeon-holed figures in the Government offices, nor the red-inked reports of engineering experts. It was the men, the men who are tearing from the red clay two million and three million cubic yards of earth every thirty days, who are levelling mountains, and building the greatest dams and locks in the history of the world.

The Nation.

NEW YORK, THURSDAY, SEPTEMBER 23, 1909.

The Week.

In his speech at Des Moines in regard to the regulation of railway rates, President Taft began with a frank declaration that the Interstate Commerce Commission's powers, as enlarged by the Hepburn Railway Rate law of 1906, had not furnished the expected relief against discriminating rates. This has resulted chiefly, in the President's view, from the delays incident to the appeal from the Commission's decisions, to courts with an already overcrowded docket. Mr. Taft proposes a new court of five judges, whose jurisdiction shall extend primarily and specifically to appeal cases in interstate commerce. A further obstacle has been the present restriction of the Commission's own supervision of rates to cases where formal complaint was made by an aggrieved shipper. This situation the President would remedy by so extending the Commission's powers that it may institute complaints by itself. Noticing, also, a fact familiar to all railway and commercial people during the three past years—that, without a formal advance in rates for given commodities, the change has been made in a left-handed way through transferring such commodities to a different "classification," bearing a different rate—Mr. Taft urges extension of the Commission's authority so that it may entertain complaints, not only against unjust rates, but against unjust classification.

The general public will probably be more widely stirred by the President's recommendation that the Commission be hereafter empowered to regulate the issue of railway securities. What the law, in Mr. Taft's judgment, ought definitely to contain is this:

> Prohibition against an interstate railroad company acquiring stock in any competing railroad in the future, and a further provision that no railroad engaged in interstate commerce shall, after a certain date, hold stock in a competing railroad, and the further amendment that after the passage of the amending act no railroad company engaged in interstate commerce shall issue any additional stock or bonds or other obligations, except with the approval of the commission, based upon a finding by the commission that the same are issued, first, for purposes authorized by law, and, second, for a price not less than par for stock, and not less than the reasonable market value for bonds, such price being paid either in cash or in property or services, and if in property or services, then at the fair value thereof as determined by the commission.

It is scarcely necessary, with the reviews of Mr. Harriman's career in Union Pacific so fresh in the public mind, to point out the highly important bearing which a provision of this nature would have on current railway finance. The powers proposed are large, and it is not to be denied that occasions may arise when their employment will involve a delicate situation—something which happened very recently, in the use of the same authority by the Public Service Commission of this State, in the matter of the Erie Railroad's bond issue. Yet, on the other hand, it cannot be questioned that a grave danger has existed in the field of railway finance, under latter-day methods, and that no practicable way of averting it appears to exist, short of public supervision under a plainly restrictive law.

The romance of the polar seas is strikingly illustrated by the narratives from the Roosevelt of Peary's assistants. Nothing has so fascinated the imagination of those who read of the Arctic as its ability to preserve the relics of the past. Elsewhere the dead wither and decay, and houses and their fittings return to dust, but the icy grip of the Polar regions preserves with wonderful tenacity. The relics of Sir John Franklin's expedition, found twelve years after by Capt. McClintock, told the story of its melancholy end. But even this discovery could have been little more impressive than Mr. McMillan's entering the home of the ill-fated Greely expedition, and finding everything intact, even the food eatable a quarter of a century after it had been abandoned by the men who left it, some to perish, some to rise to military distinction. The relics of the Polaris expedition recall vividly the story of that ill-fated undertaking, while those belonging to the venture of Sir George Nares bring to mind an even earlier period of Arctic exploration. Incidentally, it must be noted that these reports from Peary show that his sledging and hunting parties covered a surprising amount of ground with amazing thoroughness and success.

The defeat of all the Constitutional amendments submitted to the voters of New Jersey is the more to be regretted in that it was effected by so small a poll. Less than 20 per cent. of the electors took the trouble to cast a ballot. Yet here was at least one matter of the highest importance—the reform and reorganization of the courts—which had been forcibly pressed upon the attention of the people of the State. The Governor had made speeches upon the subject; the leading members of the bar had organized and worked to secure the desirable change in the judicial system; eminent and impartial members of the judiciary itself had recommended it; newspapers had kept it before their readers. But all these efforts could not break through the general indifference, which permitted the secret agreements of party politicians to defeat the salutary reform by a handful of votes. This unhappy result is one which the advocates of the referendum are bound to weigh. The New Jersey experience is in line with many other lamentable failures to induce American voters to take interest in Constitutional amendments, or general proposals of legislation. Local and municipal elections, as in Cleveland, have sometimes been of the nature of a referendum, and have been hotly contested; but, in general, the method seems to be badly fitted to the habits and desires of the American democracy.

It is a true national loss which we suffer in the death of Gov. Johnson of Minnesota. He had long since risen above the stature of a State Executive, and was seen afar by the whole country. Death has again stricken down a rising hope of the Democratic party. As in the case of Gov. W. E. Russell of Massachusetts, a born leader has been cut off in his prime; and men look at each other and ask why misfortune pursues a party that never had so great need of its best men as at the moment when they are forever lost to it. One reason why Gov. Johnson drew the hearts of the people after him, was that his career was of a sort that we like to think

typically American. He began life in the most humble circumstances, and had to fight his way against obstacles that would have daunted a man of less firm fibre. Moreover, like Lincoln, the long and hard struggle to get himself clear of the rock upon which Nature had cast him as a bantling, left him full of human sympathies and kindliness, and able to enter understandingly into the lot of every toiler. The pang of sorrow at his untimely death will be widespread, because men in all the land will feel, as Lowell said they did when Lincoln was taken, that "their manhood had lost a kinsman."

The motor car, and what it represents, is doing its deadly work in idealistic Kansas. Chancellor Strong of the University of the State sounds a note of alarm and warning against the growing degeneracy of the scholastic youth. "Overflowing granaries and bulging banks" are beginning to have their insidious influence on the rugged Western stock. The boys in the university, who, in former times, studied with an eagerness which put to shame the lackadaisical "dudes" of the Eastern colleges, now are beginning to give themselves up to the soft dalliance of the automobile and the kindred things which work destruction. Our hopeful poets still sing about the West. William Allen White, for instance, is shocked by the effeminacy of old Europe, and heralds, in letters and in interviews on his return, the sterling virtues of Emporia, Kansas. Gov. Johnson called the West to arms against the tyranny of the East. But this very intensity is a symptom of unacknowledged decay. William Allen White is more extreme than he would be if the virtues he proclaims were an unconscious part of the being of his State. Westerners are now so conscious of their ruggedness that it has become, perhaps, already a tradition, rather than a reality. We passionately praise what is about to pass away. We cling in our minds to the fine old virtues, as we sadly yield ourselves in reality to demoralizing luxury. This seems to be the feeling of Chancellor Strong of the University of Kansas.

Blue Sunday is not the proper color term to describe the American idea of the Sabbath as opposed to the so-called "Continental" day of rest. The American Sunday is now become a blue, red, green, yellow, and purple day, testifying, by the litter of comic-supplement lithography which overflows from the sitting room to the sidewalk and from the porch to the lawn, how a great Christian nation spends its Sabbath. Fortunately, there are signs of growing opposition to the pictorial vulgarities on which our children have been fed. The Boston *Herald*, which last year abolished its Sunday comic supplement, has found no reason to repent its action; far from it. At the recent national convention of the Catholic Educational Association, the Parish School Department entered heartily into the campaign against the Yellow Kid art, and called upon Catholic parents "to cooperate by word and example in the extermination of the evil." The diocese of Philadelphia is preparing to take up the fight against the "scandalous evil which corrupts manners, language, filial respect, and the sense of reverence for age and suffering." To us the æsthetic implications of the comic supplement have been as poignant as the ethical. That a nation exceptionally gifted with the sense of humor should be brutalized down to the level of the horse laugh, is a sad thing indeed.

John Bigelow's protest against the Hudson-Fulton celebration will undoubtedly find considerable echo. There have been those from the beginning who have felt aggrieved that so great an expenditure of money was to be lavished upon a passing show, leaving nothing behind in the way of a permanent memorial, save one monument. Had not there been a revival of prosperity, these grumblings would have been louder, even though the money is to be largely expended in New York city and is making work for many hands for a few days or weeks. But while one may heartily sympathize with Mr. Bigelow's wish that instead of by pageants, the explorer and the inventor should be honored by the purification of the Hudson River, there is much to be said in behalf of an occasional holiday of the kind now planned. If it is, after all, a Roman holiday, *panem et circenses* for the crowd, it can be maintained that an occasional outing for the people in a land singularly destitute of fiestas, sadly lacking in gayety, and taking its limited amusements with the strenuousness of baseball competitions, is not without its genuine value. Recreation and relaxation have their worth, even from the industrial point of view. The wages some may lose in the turmoil may be made up in the increased efficiency which comes from a break in routine, an escape from the treadmill of the worker who never leaves the city's streets and toils, year in, year out.

A weakness in Lord Rosebery is pointed out by the London *Nation*. Lord Rosebery's virtual secession from Liberalism to Conservatism, in connection with his recent speech on the Budget, is an event, it maintains, of no special importance. It is merely interesting, "like Blériot's capture of a momentary 'record,'" but it has little real weight of influence. "It was so with Lord Rosebery's Premiership. It was so with his Chesterfield speech. Nothing happens as a result of his innumerable excursions, alarums, appeals, perorations, and protests. . . . With him all is pose. . . . An epigram or two, an emotional triumph, a plausible representation of a national mood, a storm of applause, and the accomplished artist disappears, as the *diva* retreats to the wings, bowing and pressing to her bosom the tributes of an enraptured 'house.'" The article presents Lord Rosebery as a mere orator, who with grace and charm expresses thoughts without coherence or progressive effect. He is not a definite influence either by his faults or his virtues. Removed from the need of making personal profit of any kind from politics, there is no lofty substitute, such as serious public service, which takes its place. Lack of seriousness all around brings in the note of civilized frivolity. Few of our politicians can be accused of this. If they are kept serious by no higher purpose than to "serve" some interest, they have, at any rate, that anchor.

A German writer in the London *Daily Mail* expresses the amazement which observant Germans and Americans invariably feel on reaching London and viewing the sickening squalor of the poor. Poor there are in New York and Berlin, as well as elsewhere; but in no city is poverty so repulsive as in the English capital. The *Mail's* contributor, Dr. Oscar Schwerner, saw in Hoxton Market what he had never beheld before—wo-

men and children so filthy that he was afraid to touch them. Yet he, like other residents of the Continent, had always believed the English to be personally the cleanliest people in the world. The reason, he thinks, is that Germans are taught cleanliness in schools and in the army, and that dirty, ill-kept tramps are not permitted to wander abroad for long without being put to work. The dirty school child is sent home, and the police see to it, if the parents do not heed the first warning, that repeated offences are made impossible. Dr. Schwermer feels, too, that much British unemployment is not due to lack of work, but to lack of a desire to work. "We have no unemployed question [in Berlin]," writes Dr. Schwermer, "and no poorhouses. I do believe that this latter fact is one of the reasons why we have no unemployed to deal with." England's liberal policy of poor relief has long been held to be a method of creating poverty, and her universal old-age pensions just established make in the same direction by destroying one of the chief incentives to saving and industry. Yet it would be idle to deny that there are heartrending cases of genuine lack of employment in all the British cities.

The adequate way in which some German municipalities take care of their citizens is shown by the city of Ulm. That town has so well solved the question of homes for workingmen and clerks that social-political students, not only from other parts of Germany, but from England, Japan, Italy, Norway, Austria, Russia, and Switzerland, have gone there for light on the "home" problem. During a period of some twenty years, the city has acquired ownership of large tracts of land for the purpose of securing for the poorer class of the population cheap, good, and healthy homes; an object already realized to a surprising degree of completeness. The experiment was tried first on a small scale. Land in an outlying part of the city was bought, small but good houses, each with a garden, were built upon it, and then sold to persons of moderate means in the most reasonable way, so that a workingman could, after a number of years, own his own home. The aim has been achieved to the extent that now the workingmen and clerks of Ulm are in large measure provided with well-built, healthy, and cheap homes. "Order, cleanliness, and happiness" are the rule in Ulm. The death-rate is noticeably lower than in other cities of Germany, while mortality among small babies has fallen very low. Many other public improvements have, of course, contributed to this general well-being. The city neglects no matter touching the good of the citizens. This naturally involved great public expenditures, and yet Ulm's tax-rate is lower than any other city of Würtemberg. There is in Ulm, therefore, not the slightest murmur when further measures are taken to acquire more municipally-owned land and to increase building by the city. If we had only one city in the United States which to this degree should combine light taxation with effective city government, we might trust municipalities with more widely extended functions than we are to-day inclined to do.

The instinct for ornamentation of Paris goes on unchecked. The Rond-Point of the Champs Elysées is to have four colossal statues, by as many sculptors, answering to the labels of Summer and Winter, Day and Night. Early next month, Rodin's statue of Victor Hugo will be unveiled. A monument to Oscar Wilde, designed for Père Lachaise, is under way. A statue to the revolutionist Marat is also projected. An equally subversive man, in another field, Catulle Mendès, is to be celebrated in external form, and Baron Haussmann, who modernized the external old Paris, is to have a monument. It is said that a new association, which certainly sounds Parisian enough, is to be formed, called "The Association Commemorative of the Great Forgotten Ones." Among other great unknowns, the inventor of the corkscrew is contemplated as a subject for plastic notice. Imagine the enthusiasm that such a statue would cause among the habitués of the "Art" cafés in Montmartre and Montparnasse! At last, the favorite source of inspiration for the minor poet and the soul-analyzing artist would be officially recognized.

If anything were needed to prove the innate depravity of the Japanese, the recent speech of Premier Katsura should suffice. He actually informed the Bankers' Club in Tokio that his government would continue to avoid unproductive expenditure so far as possible. Not only is he going to devote $26,500,000 towards the redemption of bonds next year, but he actually hopes to lower the rate of taxation. If final proof of his duplicity were needed, it is surely to be found in his statement that there is to be no increase in army and navy burdens. We think that every one will see that this is merely an Oriental ruse to lull foreign nations, and particularly the United States, into security, while he constructs, in the interior of Japan, a large number of battleships for that sudden raid which our naval officers still expect may take place next week or next month, they are not certain which. Last year the Japanese government actually made a serious effort to retrench. If Katsura continues this policy, it may be that after a while he will convince some people against their will that the nation's eyes are bent not on conquest but on internal growth.

The progress of the anti-opium campaign in China, down to November, 1908, is treated in a parliamentary paper embodying the report of the British commercial attaché at Peking. The report contains good news and bad, with the former decidedly predominant. Like every other movement in that bulky and limping empire, the fight against opium is a real fight in some provinces and a delusion in other provinces, according to the character of the local officials. In the metropolitan province of Chihli, the reform is prosecuted with "earnestness and vigor." In Shansi, "official professions are excellent," but not very much has been done. Shensi, Kansu, and Manchuria show apathy, but in Yunnan, second in importance of the opium-growing provinces, the governor-general predicts the wiping out of all traces of opium "in a few months." Not the least encouraging feature of the report, however, is the indicated growth of a strong public sentiment against the use of the drug. In Shanghai and Canton, where the opium-houses were the gathering places of the fashionable youth, the resorts are now shunned. "It is doubtful," says the report, "whether any question has ever stirred the Chinese Empire so profoundly as that of opium suppression; and public opinion, backed by a young but growing patriotism, is gradually but surely branding opium smoking as an evil that must be eradicated."

PINCHOT VS. BALLINGER.

The long and bitter dispute which has raged about the acts and the policy of the Secretary of the Interior, has now been judicially reviewed by the President. His letter, published on Thursday of last week, reads exactly as if it were headed: "Pinchot vs. Ballinger. Opinion by Mr. Justice Taft." It is the calm and complete decision of a judge. All the rumors, all the excited charges, all the recriminations have been brought to the test of law and fact. The judgment rendered is impersonal and dispassionate. It is not too much to say that it disposes of the whole case. The President could have given no better proof, on the eve of his Western journey, of his desire and his ability to do exact justice, than he has furnished in this remarkable and conclusive review of a heated controversy.

He puts it beyond a peradventure that the accusations levelled at Secretary Ballinger, and, by inference, against the Administration, were made in ignorance of the facts. One of the minor charges against Mr. Ballinger was that he had, before becoming a member of the Cabinet, acted as counsel for the so-called "Cunningham claimants" to coal lands in Alaska. The Guggenheims and other monopolistic interests were supposed to be behind these dubious claims, and the Secretary was pictured as their tool in office. But now the facts are set forth, and show that Mr. Ballinger appeared for a single claimant, found and so advised him that his patent could not be confirmed, and charged him for this service and travelling expenses $250. Since then, the Secretary has had nothing to do in any way with these claims.

The great reverberation, however, has been over the revocation of the Roosevelt withdrawal of public land that might be used for water-sites. In this we were asked to see the sinister influence of the "Water-Power Trust." The story went that thousands of acres which were withdrawn by executive order last January, and many valuable sites for water-power, had been greedily snapped up, when that order was revoked. But what are the facts? The Roosevelt order was issued with characteristic impetuosity and sloppiness. It covered 1,200,000 acres which could not possibly be used for water power, and which ought to be open to settlement. Moreover, it was so hastily and carelessly drawn that it "*failed to include many valuable water-power sites in the immediate vicinity.*" These have since been withdrawn from entry by this negligent Administration. And what shall be thought of the main charge, that the public domain had been turned over to the Water-Power Trust, when we read the cold fact that "not one single filing on any of the water-power sites has been attempted since the original order"? The angry assertions made at the Irrigation Congress and elsewhere, and echoed through a portion of the press, are thus seen to be wholly without foundation. What the new Administration has done is to seek to proceed legally and surely, where its predecessor dashed ahead without looking up either the statutes or the facts. The water-power question is now attacked in a scientific way. From the Geological Survey accurate knowledge has been obtained as a basis for executive action, and the result has been—and this is the coldest douche for the inflamed Rooseveltians in all Mr. Taft's letter—

> There are now withheld from settlement, awaiting the action of Congress, *fifty per cent. more* water-power sites than under previous withdrawals, and this has been effected by a withdrawal from settlement of *only one-fifth* of the amount of land.

Having knocked the underpinning of fact from beneath the feet of his assailants—for, of course, they were striking at him through Secretary Ballinger—the President proceeds to read them a lesson in law. He points out that the holding up of certain contracts made by the Reclamation Service was due to an opinion of the Attorney-General that they had been made, not only without warrant of law, but in defiance of an explicit provision of the reclamation act. Furthermore, the refusal to carry out a "contract made in the last Administration," by which the work of conserving forests on Indian reservations was to be turned over to the Forestry Bureau, was a necessary consequence of the decision of the Comptroller that there was no authority for it in law. This brings out clearly the new point of view. The old way was as Secretary Garfield wrote, to take the ground that "if there be no power" conferred by statute, "it is the duty of the Executive" to make a law temporarily, "until Congress may have the opportunity to adopt the appropriate legislation." Mr. Willard French, who, in confessed ignorance of the facts, writes in this week's *Independent* on "The Seizure of the People's Water Power," puts it in this way: "The central question is whether he is the better lawyer who acts only under specific legal provision, or he who acts without specific provision, provided his action is . . . in sympathy with the spirit of existing laws." Against such loose doctrines, easily running into the grossest forms of Executive usurpation and tyranny, President Taft asserts himself in language that is really an end of controversy:

> In my judgment, he is the best friend of the policy of conservation of natural resources who insists that every step taken in that direction should be within the law and buttressed by legal authority. Insistence on this is not inconsistent with a whole-hearted and bona fide interest and enthusiasm in favor of the conservation policy.

We do not imagine, and probably Mr. Taft does not, that his letter will still the raging of the heathen. As their clamor was essentially irrational, they cannot be quieted by mere reason. So soon as these gentlemen have recovered their breath, after Mr. Taft's body-blow, they will doubtless begin again to cry out and to cut themselves with knives, lamenting once more that the glorious work of the Roosevelt Administration is to be undone. That hysteria bids fair to persist and to have important political consequences. The mania will undoubtedly break out in an acute form next year, on the return of a distinguished traveller from Africa. By that time the veiled attacks upon Mr. Taft may become open. He can do nothing to prevent that. But he can prevent it from being anything but silly and futile, if he perseveres in his quiet purpose to decide honestly as a judge, and not as a politician, every large question that comes before him.

THE PLAN FOR A CENTRAL BANK.

Three speeches from responsible quarters have dealt with the possible reform of our banking and currency system through the establishment of a central bank. President Taft touched upon the project in his address to the Boston Chamber of Commerce. President George M. Reynolds of the Continental National Bank of Chicago, to whom Mr. Taft

originally offered the Treasury Department, canvassed the proposition in great detail, in his presidential address to the bankers' national convention. Speaker Cannon, in some remarks to the same assembled bankers, set forth his personal views upon the subject.

Of the three, Mr. Cannon's remarks alone may be described as negligible. They merely reiterated the opinions of a narrow-minded and ill-informed public man, whose judgment on matters of the sort is usually the outcome of prejudice and ignorance. In his belief, the absurd Aldrich-Vreeland "emergency currency bill" of 1908 is a perfect measure which ought to be permanently incorporated in our statutes, and the conclusive argument for perpetuation of the existing banknote system is the fact that nobody ever lost any money through it. We shall waste no time in discussing Mr. Cannon's opinions.

Mr. Taft's speech is important, less for any light it throws on the problems surrounding the central bank than for the inference that the Administration is seriously considering that remedy. Advocacy of the central bank alternative, in Presidential messages and in Treasury reports, would ensure wide popular discussion of the plan. Secretary MacVeagh, however, has since then made it clear, in a statement through the *Evening Post*, that the Administration is not committed to the plan and is not likely to take any official position on it until the Monetary Commission shall have reported, which may be many months from now. Mr. Taft quoted Senator Aldrich—and the citation is certainly interesting—as submitting the two "indispensable requirements" in a central bank, "that control of the monetary system shall be kept free from Wall Street influences, and that it shall not be manipulated for political purposes." This is indeed a *sine qua non* in any such proposal, to a degree which people not conversant with recent banking and Wall Street history probably do not realize.

Mr. Reynolds's Chicago speech is a contribution of great value to the discussion; it is in fact the first detailed examination of the subject in the light of practical banking experience. The central bank is frankly advocated by Mr. Reynolds, but he recognizes the difficulties which would surround its practical organization and the restraints which judicious lawmakers would necessarily impose upon the scheme. Briefly summarized, his highly interesting stipulations, as to the scope and character of such an institution, are these: Its subscribed capital must be large enough to command confidence—not less than $100,000,000. Its shares may be offered either to other banks or to the general public; preferably the latter, with a government guarantee of a low dividend, profits above that dividend to go into the public treasury. The bank should be the sole depository of government funds, but should not be charged with individual responsibility for preserving the public credit. It should hold on deposit the reserves of national banks which perform the same function for the smaller national institutions.

Its discount business should be limited to credits of ninety days or less, based on real commercial transactions and with a sound endorsement, paper of a speculative character being rigidly and by law excluded. It should discount for the general public, but not take deposits from it. Notes issued by the central bank should be in part secured by a coin reserve, and the balance of security should be, not railway bonds or real estate mortgages, but the short-term commercial notes above described. The bank should be supervised by a board named by the President of the United States and the Treasury Department, and confirmed by the Senate. Shareholders should elect the regular board of directors, but the supervising board should have the power of naming the president and active managers.

Opinions will differ whether Mr. Reynolds's safeguards against intrusion of politics are sufficient to achieve that end; and it will also be observed that he does not deal with three important considerations—how the existing banknote currency is to be retired, how far the central bank, through branches or otherwise, shall compete with other institutions, and what shall be the ratio of coin reserve to note circulation. As it stands, his outline of the scheme provides an excellent basis for further expert discussion of the matter. The *Nation* is not prepared to adopt the project, however, until these and certain other considerations have been more fully debated. In particular, it is necessary to be always on one's guard against hasty analogies between the needs of the American banking and commercial organism, and those of other nations where the central bank is now in successful operation.

Prof. O. M. W. Sprague of Harvard University, in a recent number of the *Quarterly Journal of Economics*, has summed up certain salient difficulties in the way of the plan proposed, which would run against even Mr. Reynolds's scheme of operation. We have not space to discuss them here at length; in general, they have to do with the inevitable and possibly very awkward concentration of reserves, in a country of such magnificent distances as ours; with the sectional protests which would certainly be aroused by concentrating in one place deposits of surplus public moneys, drawn by taxation from a thousand separate localties, and with the difficulty of earning even a moderate profit under the severe restrictions laid down for its banking business. We may suggest another weighty consideration—namely, would such a central bank, even under Mr. Reynolds's precautions for administration, serve the purpose of restraining excited trade and speculation through arbitrary raising of the prevalent discount rate, or would the tendency be to ease the path of banks whose own operations were helping financial and industrial inflation?

TAFT ON THE TARIFF.

If President Taft hoped by his long speech on the tariff to soften the heart of the Western cow, it is already obvious that he failed of his object. Instead of conciliating the low-tariff Republicans of the West, he has further enraged them. In place of an answering genial smile, he has got a howl. Even the incomplete collections made of Western newspaper opinion show that the President did not accurately gauge the sentiment of the West, or, if he did, trampled upon it. The political consequences of his speech, unless something be done to retrieve them, bid fair to be considerable. Predictions of the election of a Democratic House next year will be offered more confidently than before. Incidentally, the movement to unite the Democratic party in this State, and to make it fight squarely on the platform of a tariff for revenue

only, cannot fail to get new impetus from this speech of the President's. Politically, it looks like a blunder.

Personally, President Taft again appears in it as a man striving to be entirely frank and judicial. Only, he has to confess that a protective tariff is a subject upon which it is terribly difficult to form an unbiassed opinion. There is something almost pathetic in the way in which this former judge, accustomed to having all the relevant facts given him before being asked to pronounce judgment, cries out at the impossibility of ascertaining the truth about the real effects of protective duties. "I have never known," said Mr. Taft, "a subject that will evoke so much contradictory evidence as the question of tariff rates." He added: "There ought to be other methods of obtaining the evidence and reaching the conclusion." That is honest, but it does not go very deep. It would have been more instructive if the President had proceeded to show why, in the nature of the case, protected manufacturers will not give truthful evidence, and why, in the bargaining and log-rolling and bribing which always attend the passage of a high-tariff bill, it is almost impossible to put your finger on the liars. No principle is involved except that of greed and grab. At the bottom of that well, truth is, indeed, apt to be invisible. If a definite test could be made of each duty—if the simple question were asked what rate would produce the most revenue—then we should know where we stood. But with all the personal bias and selfish scheming and political deception on a grand scale that go to the making of a protective tariff, it is no wonder that the President should confess, despairingly, that he is unable to separate the truth from the falsehood.

This being so, it is a pity that he should have allowed himself to be misled by prejudiced information. It is true that he spoke out manfully about the iniquities of the woollen schedules. In his opinion, the duties on woollen goods ought to have been lowered. Their retention, practically unchanged, he frankly admits to be one great blot upon the new tariff. But of the cotton schedules, he enters upon a labored and inconclusive defence. It is evident that he is not accurately informed on this subject. He can hardly have read Senator Dolliver's speech, made on the final passage of the bill, in which it was conclusively shown that the duties on cotton goods had been not only enormously and deceptively raised, but made much higher than the rates with which the cotton manufacturers assured the Ways and Means Committee they should be entirely content. If the President had looked carefully into the accessible facts, and ascertained who it was that, in conjunction with Senator Aldrich, grafted (the word has two meanings) these needless and artfully concealed cotton duties upon the bill, he must have classified the cotton schedule as a twin injustice with the woollen duties.

When President Taft declares the Payne bill to be the best tariff ever enacted by the Republican party, there is a sense in which his words are true. It does not turn upon a nice balance of increases and reductions in the bill. Nor is it merely a question whether there was sufficient revision downwards to constitute a fulfilment of the pledges made in the party platform and by the President. The critical thing is the undoubted fact that the President dragged a reluctant high-tariff party into admitting that tariff rates ought to be lowered, and then induced it to set about at least a certain degree of lowering. This is the large and significant fact which will stand out when the history of tariff changes in this country comes finally to be written. President Taft forced a new attitude upon Republicans. Even if grudgingly and angrily and inadequately, yet they began to face the other way and to abandon their old position that no protective duties could be too high. For this, Mr. Taft deserves all recognition; but the chiefly disappointing thing in his speech is his apparent willingness to let his work stop at this point. It is not simply that he discourages the idea of another general tariff revision during his Administration—nobody would urge that—but that he seems not disposed to get the full profit of the Tariff Commission. True, he speaks of his purpose to have full investigation made into the actual working of the tariff, at home as well as abroad, but he intimates that no legislative use will be made of the results thus reached. That may come later, he explains, but he himself contemplates sending no further tariff recommendations to Congress.

Now, that attitude, it seems to us, is virtually for the President to deny his own child. The very purpose of the Tariff Commission was to furnish a basis for legislation, from time to time. If given duties are found to work injustice, or hamper trade, why should they not be changed? Why is it not the duty of the President to act upon the information which his subordinates furnish him at his own request? This is no question of a disturbing general overhauling of the tariff. The point is purely whether a demonstrated wrong or harm should be left in the law, when a Presidential recommendation and an act of Congress could take it out. It is Mr. Taft's seeming unwillingness to press home his advantage which is most discouraging to those who have sought to hold up his hands in his fight with the high-tariff Bourbons.

THE MAKING OF BOOKS.

It happens to be a book on French architecture that raises in us an old query: How and why certain books are written. The general presumption is that every author looks into his own heart and writes, but many writers evidently do nothing of the cort. Impelled by lack of occupation, of money, or of both, to write a book, he, or more commonly she, prudently consults the publishers' lists and an unfocussed intellectual curiosity. Shall it be "Spanish Cathedrals" or "Family Life in Morocco"? No book on either subject has recently been written, and the latter topic would be timely. But the "Troubadours" is also an engaging theme. Would not "Wisdom of the East" be better worth reading up? More salable, perhaps, might be "How to Know the Oriental Rugs," or a "Bride's Breviary," culled from all literature. So the eminently impartial mind of the born bookmaker travails in the first pangs of authorship.

It is the first step that costs, for the subject once chosen, the book as infallibly writes itself as a snowball started down a slope becomes of monumental size. To seek to define these creative mysteries were perhaps indiscreet. Yet one may imagine the first visit to a public library, an dthe joyous consultation of the subject-catalogue. Here, perhaps, is one of those revulsions of spirit to which genius is prone, for a man or a woman with only one book to write certainly cannot read a hundred books by other people. A brief chat with a friendly sub-librarian smooths the way.

He hints at German monographs, cursed in style but containing treasures of fact, latest discoveries in the field, or what not. But the bookmaker reads no German. The adviser takes another tack—suggests the encyclopædias. Bridling, the bookmaker explains that she is making a book, that she possesses the Britannica, and finds it inadequate; would the sub-librarian kindly recommend an authority not encyclopædically brief and not in German? Taking her measure, he recalls and recommends the book of one who consulted him in a similar spirit fifteen years ago, and turns to the routine task of persuading the young gentleman who asks for a lively novel that he really wants Thackeray.

Meanwhile, the contented bookmaker has commenced the reduction of the work of his or her predecessor into that raw material of manuscript notes wherefrom a new book may be framed. Besides the steady task of distilling the essence of the easiest book on the subject, there will be excursions and alarums into the general field. Bookmakers almost inevitably read the wrong things, but read a good deal they do. The notes take on a singularly readable quality. Having but half-knowledge or none, the zest of discovery, unchilled by considerations of mere accuracy, sustains the worker. Prince Kropotkin has noted the joys of reading a language that one barely understands. All the words and phrases are unstaled by familiarity. It is in this spirit that the bookmaker files commonplace upon commonplace until there is a sufficient mass to fill a book.

Here we seem to approach the solemn moment of literary creation itself—that moment in which inchoate materials are fused into a new and lovely form. But the case is really simpler than that. The bookmaker indulges none of the prodigalities of authorship. The plan, always the most obvious, usually that of the last bookmaker in the field, has been determined already. The notes, naturally, have not been made with pains, in order that some may be considered and thrown away. There is no nonsense about your bookmaker. All the material must go in, and when there is enough of it, from that day, like Francesca, she reads no more—except for copying off, the book is ready.

This at least is the end of it, you will say. Having given pleasure to its creator, its office is accomplished, oblivion awaits it. There could be no greater mistake. This ought to be the fate of such a book, but, as a matter of fact, no nautilus ever swam more proudly the sea than do these feather-headed books ride into popularity. It is such works that a regiment of agents impose blandly upon the unwilling, yet fascinated, farmer's wife. This provender is duly fed to thousands of women's clubs. The bookmaker is not without honor among publishers, and is mentioned respectfully by literary editors. And the book itself—even it does not die. After a fitting season, it is resolved into notes by a new bookmaker, recompacted into a book, re-eulogized, re-advertised, re-read. The phenomenon partakes of the cyclic character of cosmic processes.

Some impatient and cynical philosopher will ask, Why isn't the bookmaker found out? In a world where value persists, what keeps this literary comedy going at the public expense? Here we find something more than the universal love of illusion. The bookmaker has a very definite quality—that of being or simulating the average reader, and the product usually has the undeniable merit of readableness. The bookmaker has the plain man's cardinal virtue of not knowing much about the subject, but knowing what he likes. What he has happened to like in the desultory process of uncritical note-taking, Tom, Dick, and Harry are pretty sure to like in the equally casual process of reading. They trust the bookmaker, who is, or seems to be, their own kind. So the plumber of Rochester will buy a balm for lumbago more readily on the testimonial of the baker of Buffalo than on that of a banker from Chicago.

Yes, the bookmaker, if a most imperfect, is also a necessary institution. The problem is not how to abolish, but how to amend him. If one could add to his diffused curiosity a zeal for reasonably exact information, reinforce his industry with a modicum of scholarship, eliminate his trivialities without impairing his popular appeal, one might then hail him as a veritable apostle of education. Such bookmakers there have been. The ever-delightful Mrs. Jameson is, perhaps, the best instance. And, happily, such bookmakers there still are, though few.

FRENCH BOOKS OF HISTORY

Paris, September 10.

The author's name alone is sufficient to accredit "Les Premières civilisations" (Leroux), by J. de Morgan, former director-general of the antiquities of Egypt and of late charged with the excavations at Susa, the capital of Darius and Xerxes. The book (600 pages, with 77 maps and 50 figures in the text, sold at 15 francs) is a continuous series of studies on pre-history and history to the end of the Macedonian Empire. This span of time reaches from the first signs of man's appearance on the globe to the end of Alexander's conquest, that is, to the beginning of Greco-Latin civilization. M. de Morgan long since published his researches on the Stone Age in Egypt. His present volume gives the views, and the reasons of them, of a scholar who, to special knowledge of several parts of his subject, joins the general culture needed to appreciate the results of the labor of others.

It is a long run down the ages of humanity to the subject of the posthumous volume of Achille Luchaire, "La Société française au temps de Philippe Auguste" (Hachette, 10 francs). This trained historian served his apprenticeship in episcopal and communal archives of mediæval France, and was at his best in a world still judged from the religious controversies of three hundred years later. Not that the present volume weaves any counter-legend of ideal Ages of Faith—rather the contrary. Court prelates who were comrades of warriors one hand's-breadth removed from brigands; country priests like the half-serfs from whom they sprang and whose life they shared; townsmen whose fearful commerce was slowly steering the community toward settled order, could scarcely compose a society productive of an English Sabbath. Yet those who care for this personal knowledge of bygone times will feel that the book, with all its completeness of documentary detail concerning civil and military society, does not take up so thoroughly the moral, religious, and mystical side of the times.

Ten of the twelve volumes devoted to "Paris: les anciens quartiers" (Michalon) have now appeared under the artistic direction of Georges Cain, with whose own writings they must not be confounded. The text is by various students, each of the quarter which he handles; it includes outlying places like Versailles and Saint Denis (each volume, with atlas of 40 plates, 8.50 francs). Although the interest is primarily attached to what still remains, underneath these Stones of Paris lie all the centuries of changing history.

While Philippe Auguste was building new walls round his enlarged Paris, a man who took his name from some obscure love of France began upsetting

the world by turning his back on it. "Saint François d'Assise: sa vie et son œuvre" (Perrin), by Johannes Joergensen, a Danish convert to the religious faith of the Franciscans, is written after much study of all that relates to the saint, with natural enthusiasm, and not without side reference to the Protestant work of Paul Sabatier.

Those who care for the by-tracks of historical science will find interest in "Leibniz historien" (Alcan), by Louis Davillé, a new doctor of letters. It is an essay on the historian's activity and method, which are known to the general student only from the somewhat unfavorable correspondence with Bossuet.

"Les Aventures du Cardinal de Richelieu et de la Duchesse d'Elbœuf" (Sansot) is an anonymous account from the archives of the Château of Acy, such as must have made up the underground of recent French history when Leibnitz was young. What it says concerning the daughter of Henry IV and his Gabrielle, whose husband the terrible minister of Henry's son exiled from court, is of little interest to the veracity of history, for which we have to go to writers of our own day like Hanotaux, less open to the gossip of contemporary passion. The book has an introduction and notes by Baron A. de Maricourt.

In the quite serious, but very personal, series of the History of France *racontée à tous*, Casimir Stryienski of the French University publishes "Le Dix-huitième Siècle" (Hachette). It covers the period from the death of Louis XIV to the eve of the Revolution, years fertile in Mémoires, on which the author has drawn freely. He winds up with a chapter on the artistic and intellectual movement of this century of Voltaire and Madame Geoffrin. With this may be joined a book which belongs rather to the history of literature than to that of men, "Idées et doctrines littéraires du XVIIIe siècle" (Delagrave), by Prof. Francisque Vial and Louis Denise of the Bibliothèque Nationale. It gives the literary theories of a writing century from its prefaces and treatises—a work which has been already carried out for the preceding century.

Étienne Dejean, director at the Archives, in "Un Prélat indépendant au XVIIe siècle" (Plon), gives a first complete biography of Nicolas Pavillon, bishop of Alet (1637-1677). Even the managing courtiers at Versailles, whom he worried from his distant mountain perch among rudimentary populations, would have stared at his interesting France more than two hundred years later to the extent of such a volume. This, as might easily be divined, is due to the picturesque religious legend which has been built up, among Freethinkers as well as Protestants, around Jansenism, for which Pavillon is claimed. In reality, he signed his act of intellectual obedience to the Pope in a matter where the act of faith was not directly in question; and this true Jansenists refused to do. Confusion is also made between the episcopal pretentions of this bishop who was determined to manage his own diocese in his own way, whether for or against the Pope and King who had named him to it, and the theological assumptions of Jansenists and Gallicans (who are also confused together by most literary and historical writers on this subject, so foreign to their special knowledge). Many a living bishop, who perhaps voted Papal infallibility, has also had controversies with religious orders evangelizing on their own account in his preserves. This is not enough to make the austere bishop a Jansenist saint instead of a Roman Catholic, the more so as he, like the Jansenists themselves, had no tolerance of Huguenots. The real value of such a book is not in church history, in which it does not illustrate even our own Modernism, but in the history of the rude people whom he evangelized; just as the Jesuit Saint Francis Régis had done a generation before with the same faith and sacraments, prayers and commandments. That these people belonged to the Grand Monarch at Versailles—two extremes of a social scale difficult to understand amid the clouds of party and religious prejudice—greatly heightens the value of this history at first hand.

A study of Jansenism proper, from the Roman Catholic point of view, but with the erudition in Catholic theology and canon law which is so wanting to Sainte-Beuve and his followers, is contained in a substantial book by J. Paquier, doctor of letters, "Le Jansénisme" (Bloud), a study both in history and doctrine.

"Belles du Vieux Temps" (Émile-Paul), by the Vicomte de Reiset, who has specialized himself in the history of the later Bourbons, before and after the Revolution, is a lucid and authentic picture of the careers of certain *grandes dames, tragédiennes*, and other court adventuresses. "Souvenirs de Mademoiselle Duthé de l'Opéra—1748-1830" (Louis-Michaud), is a study in the *mœurs légères* of the eighteenth century, by Paul Ginisty, a writer of the personal side of history. Rose Duthé, whose career as a professional beauty brought her into close contact with most of the personages of the dying old régime, lived to cultivate the correctness of the Restoration, and she regaled her nineteenth-century acquaintances with piquant anecdotes of the perished grace and elegance of her youth.

The love letters of "Roland et Marie Phlipon—1777-1780" (A. Picard et fils) are real documents from a world in sentimental gestation, which was soon to sweep away forever the old-time elegance. Claude Perroud, who must now have published nearly every scrap of manuscript or contemporary record concerning Madame Roland, edits these 113 letters with introduction, explanatory commentary, and notes, with facsimiles of the handwriting and a plan. This young girl, who wrote like Rousseau's Héloïse, and her elderly admirer passed through all the regulation sentiments, although she, at least, was well settled in her mind from the beginning. The tragic fate which befell them in the revolutionary storm they and others like them had brought on warrants the sentimental interest of readers, while their public career throws light on much troublous history. With the abundance of documents published in order and commented by M. Perroud, there should surely be room for a definite life of Madame Roland. It would be very different from those hitherto published and would be immensely valuable.

S. D.

NEWS FOR BIBLIOPHILES.

The latest writer on the bibliography of Molière, Jules Le Petit in his "Bibliographie des principales éditions originales d'escrivains Français du XVe au XVIIIe siècle," Paris, 1888, says of the first edition of "Le Tartuffe," 1669: "On trouve indifféremment des exemplaires soit avec le titre ci-dessus 'le Tartuffe ou l'Imposteur,' soit avec le titre 'l'Imposteur ou le Tartuffe,' sans autre différence." He gives a reproduction of the "Tartuffe" title-page, but not of the other. It seems presumptuous for an American to be making comments upon the bibliography of Molière, but an examination of several copies of this play leads us to the conclusion that the "Imposteur" title is the earlier form, and that the other title was printed later and substituted for it.

The play was written in 1664, and the first three acts were given before Louis XIV on May 12 of that year. Some friends of the King felt themselves hurt by the satire and its public presentation was interdicted, but it was played a few times more in 1664 and 1665. These early references describe the play as "Tartuffe." The interdiction was removed in 1667 on condition that (in the words of Le Petit) "le nom de Tartuffe serait rayé du titre et de la liste des personnages et qu'un certain nombre de passages seraient adoucis." The comedy was then called "L'Imposteur," and the principal character was called Panuiphe. It was first played in public on February 5, 1669. The diary of La Grange (one of the actors in Molière's troupe), the manuscript of which is preserved in the Archives of the Comédie Française, records under February "Piece Nolle de Mr de Molière Mardy 5me—Imposteur ou Tartuffe."

In the Rowfant copy with the "Imposteur" title-page there are two preliminary leaves only, the first the title, verso blank, the second the "Privilège" with the list of "Acteurs" on verso. This list contains eleven names only, one "Elmire" being omitted, and supplied in ink. In the copy with the "Tartuffe" title there are twelve preliminary leaves ā and ē, each six leaves, consisting of a blank leaf, title with verso blank, nine leaves of "Preface" and a leaf of "Privilège" with

"Acteurs" on verso. The "Privilège" does not differ in the least from that in the other variety, but the list of "Acteurs" contains twelve names, the missing one "Elmire, Femme d'Orgon" being printed in. The preface is, according to Brunet, lacking in some copies. The body of the book, signatures A, B, C, and D, each 12 leaves, pp. 1-96, is absolutely the identical sheets in both.

The "Privilège," which is dated March 15, 1669, grants permission to Molière himself "de faire imprimer, vendre & debiter par tel Libraire ou Imprimeur qu'il voudra choisir, une Piece de Theatre de sa composition intitulée l'Imposteur." At the bottom is "Achevé d'imprimer pour la premiere fois, le 23. Mars 1669."

The headline throughout is "L'Imposteur" on the left hand pages and "Comedie" on the right hand pages, except the last, p. 96, where the headline is "L'Imposteur, Com."

There is a counterfeit edition with an "Imposteur" title-page, with different imprint and different printers' ornaments throughout. It has eleven names only in the list of "Acteurs."

The second authorized edition, the printing of which was finished June 6, 1669, always has the "Tartuffe" title-page. It contains additional preliminary matter.

There was published in 1667, and again in 1668, before the printing of the Comedy was authorized, a "Lettre sur la comedie de l'Imposteur," the authorship of which has been attributed to Molière himself.

Putting these facts together it seems probable that the book was first printed with the "Imposteur" title and without the Preface, and that the new title was printed with the Preface. This at least seems to be certain, the genuine first edition with the "Imposteur" title is much rarer than with the "Tartuffe" title.

Correspondence.

AN INTERNATIONAL SCHOOL OF PEACE.

To the Editor of The Nation:

Sir: Although man has been obliged to fight his way from the beginning, yet through the development of ages he has risen in a large measure above the necessity of fighting. Formerly the lord had his castle upon a spur of the mountain for defence against the lawless and against his enemies. This custom was extended, and they would signal each to the other when danger threatened. Later it was found to be cheaper and better to settle in a town and to build around it high walls which could not be scaled. But the walled-town stage has long since passed, and we have now reached a stage of development where physical force within each nation is applied only as a police force to restrain the vicious and turbulent.

But as between nations the earlier conditions still prevail, and they continue to act toward each other as barbarians. They are suffering from fear and distrust of each other, almost wholly unwarranted. In fact, each individual nation wishes to be undisturbed in the peaceful development of its own resources. Rarely does one nation desire a conflict with another nation or to encroach upon the territory of another. Each wishes to live in harmony with the others. Yet our boundary lines are bristling with cannon, the seas are alive with battleships, and the tramp of the soldier is heard the world over. And for what purpose? Is it to curb the turbulent and vicious? No. It is because of a groundless fear of attack from sister nations. Such attacks are not really contemplated, and ought not to be expected.

This enormous expense for armies, this taxation that is draining every year billions from the treasuries of the people and bringing want, sickness, suffering, and death to multitudes, is wholly unnecessary; and the problem of international peace is how to set in motion forces which will end this frightful waste and destruction. I believe that this result can best be accomplished by appealing to the enlightened self-interest of mankind and setting in motion educational forces which will show the folly of the present status, and will also remove the fear and suspicion which are the main causes of our present wasteful expenditures for armies and navies.

But no substantial progress can be made if the effort runs directly counter to the present trend of thought and action. The idea of force cannot at once be eradicated. It is useless to believe that the nations can be persuaded to disband their present armies and dismantle their present navies, trusting in each other or in the Hague Tribunal to settle any possible differences between them, unless, first, some substitute for the existing forces is provided and demonstrated by experience to be adequate to protect the rights, dignity, and territory of the respective nations. My own belief is that the idea which underlies the movement for the Hague Court can be developed so that the nations can be persuaded each to contribute a small percentage of their military forces at sea and on land to form an *International Guard* or *Police Force*. Five per cent. of the present armaments would probably be found sufficient. If this is too small, certainly 10 per cent. would be fully adequate to protect all the nations in their rights, and to prevent any disorder or turbulence. This plan involves no marked or revolutionary change in the present methods; puts no additional burdens of taxation upon the people; but if tried, it will make the futility and waste of the present method so obvious that disarmament will naturally and inevitably follow, just as disarmament among individuals follows upon the institution and maintenance of an adequate police force. When the nations see that this international police force is ample to insure them all their rights, they will be unwilling to bear the present excessive burdens for armament; and disarmament, or at least nine-tenths of it, will come as a natural and inevitable result of a perception of the obvious uselessness of armament.

The plan which I would establish is somewhat as follows:

(1.) There should be founded, I think in corporate form, an International School of Peace. Such a corporation would be a permanent legal machinery for receiving and disbursing contributions and bequests; for it is an important part of my purpose and hope that the fund which I have provided for should be but the nucleus and beginning of a great endowment, contributed by others and perhaps by the governments themselves, to forward this great cause.

(2.) This International School of Peace, whether incorporated or not incorporated, should have a president, secretary, treasurer, and board of managers or directors, making up an executive committee, constituted of men who are known for their soundness of judgment as well as for their devotion to the public welfare. An advisory council, consisting of men prominent in the peace movement, might well be constituted.

(3.) There should be a Bureau of Education which should attempt to modify the courses of study in our schools, colleges, and universities, by eliminating the use of such literature and history as tend to inculcate unduly the military spirit and to exaggerate the achievements of war. Too much of our history is now devoted to accounts of battles and to the exploits of war heroes; too little respect and attention are directed to the unselfish and self-sacrificing lives of thousands of noble men and women who have striven and achieved mightily for the benefit of the race in the fields of peace.

International exchange of teachers and students, in accordance with the ideas which underlie the Rhodes scholarships and the recent exchange of professors between Germany and America, should be further extended, even among the teachers of our public schools.

Social intercourse among the educators of different nations should be extended in every possible way. "Stranger" and "enemy" always have been nearly, if not quite, synonymous terms.

The circulation of such books as have already been published under the name of "The International Library" should be advanced in every possible way, and the publication and circulation of other books having an analogous tendency should be encouraged.

The coöperation of the clergy should also be obtained. They should be interested in the peace movement and induced to preach upon its various aspects and to work among their parishioners, so that they may make their pulpits and lives a real power for "peace on earth and good will towards men." Theological seminaries and other institutions for training preachers and clergymen should be brought to see the importance of this movement.

Either separately, or as a part of this Educational Bureau, there should be an organized attempt to influence the press of the world. Facts and arguments tending to show the advantages of peace from an historical and economic standpoint should be gathered and distributed to newspapers and magazines everywhere. An editorial corps, thoroughly trained, should furnish constantly to the press of the world material which would make for peace. One of the present great dangers of war is to be found in false, misleading, and inflammatory statements about international relations, written by irresponsible persons and circulated by sensational newspapers.

Again, why should not the government appropriate money for the proper training of its civil servants, ten thousand in number? We have the amplest schools at West

Point and Annapolis for the training of our young men for warlike duties. If carefully educated, able men were employed in each of the capitals of the nations, to smooth out the various difficulties that might arise at the very beginning, who can estimate the beneficent effects upon our international relations? Is it not worth while for the governments of the world seriously to consider the establishment of a school for the education of their servants and a bureau, under the control of a Cabinet officer, whose duty it should be to study broadly international relations, looking toward the peaceful development of each nation? The time may come, and I hope speedily, when the minister of peace will be regarded as important to the human race as the minister of war.

Our business organizations—chambers of commerce and other similar associations—should be addressed and interested in this question of the burdens of war and of the threat and fear of war. These various organizations listen with intense interest to discussions on the effect of the tariff upon business, and spend a great amount of time and thought upon all such matters, yet entirely overlook the fact that almost, if not quite, the greatest single burden that business is now bearing is the war burden.

(4.) A political bureau should be instituted, which should employ men of statesmanlike grasp and power in all the main capitals of the world, to watch over the course of legislation and to work for the reduction of armaments. Such men should scrutinize all matters of international concern and strive in every way to prevent trifling causes from exciting international disputes and the war spirit. Many wars should and would be prevented if able, discreet, and statesmanlike men were in the capitals of the world, watching and working for good understanding and peace.

To such a school I am myself planning to give $50,000 a year, and to endow it after my death; and it is my hope that other men will be ready to increase the fund to an efficient amount. But however carefully we may plan for this great work, its success must depend finally upon the *kind* of men and women employed. It is my belief that this organization should first aim to secure the most talented persons in their line, men and women who desire to devote their lives to the cause, making sure that we have a fund sufficiently large to guarantee them a salary adequate to enable them to do their work effectively and at the same time provide themselves with the ordinary comforts of life. Above all, every one who enters the ranks should do so because of an all-absorbing interest in the cause. I would rather have one, thus equipped, than a hundred of equal ability who were influenced largely by the salary to be obtained. The success of this organization will depend upon the amount of enthusiasm we put into the work, and it must be the enthusiasm of a reformer—a Godfrey, a Savonarola, a Garrison, a Phillips—the kind of white heat that burns when it touches a community. With such a spirit great things can be accomplished.

EDWIN GINN.

Boston, Mass., September 7.

"DANT IN ENGLISH"; A SOLUTION.

TO THE EDITOR OF THE NATION:

SIR. The writer of the review of Paget Toynbee's "Dante in English Literature" (the *Nation*, August 19) censures the author because considering Chaucer's debt to Dante he makes nothing of Lydgate's curious "Dante in English," which, according to Professor Skeat, Mr. Toynbee, and many others, Lydgate gives as a work of Chaucer's. May I offer a solution of this literary crux?

The problem is briefly as follows: in the prologue to his "Fall of Princes" (not "Falls," as Mr. Toynbee miscalls it) Lydgate eulogizes the writer's profession, and in particular, Petrarch, Boccaccio, and Chaucer. Of the last he gives a somewhat random list of works. After mentioning the "Troilus" and other poems, he says:

> He wrote also full many a day agoon
> *Dant in English himself doth so expresse*
> The piteous story of Ceix and Alcion
> And the dethe also of Blaunche the Duchesse
> And notably he did his busiuesse
> By great avis his wittes to dispose
> To translate the Romaunt of the Rose.

(I omit punctuation for reasons which will appear. Concerning the phrase "Dant in English," I will only say that this reading is universal among the twenty MSS. of the "Fall," which I consulted last year at the British Museum and at Oxford.)

Professor Skeat's argument rests on three points. He takes it for granted that the works named in the stanza are "Dant in English," "Ceix and Alcion," "The Dethe of the Duchesse," etc.

(1.) In the Prologue to the "Legend of Good Women," Chaucer says he wrote (it is by the mouth of the God of Love, to be sure) the "Hous of Fame," "The Dethe of the Duchesse," and the "Parlement of Foules." Lydgate recollects this list of Chaucer's obviously, and uses it for other details (too long to insert here), and it is therefore only natural to expect mention of the "Hous of Fame," where "Dant in English" occurs. Mention of the "Parlement of Foules" occurs in the next stanza of Lydgate.

(2.) The "Hous of Fame" is so obviously the only poem greatly influenced by Dante, that it must be the one mentioned.

(3.) The "Hous of Fame" is not elsewhere mentioned in Lydgate's list. It is too important to have been entirely passed over.

Professor Skeat interprets the italicized line as follows: "(I give it that name for) he, i. e., Chaucer, expresses himself like Dante (therein)."

I answer these arguments *seriatim:*

(1.) Professor Skeat totally neglects the fact that "Ceix and Alcion" intervenes between the phrase "Dant in English" and the "Dethe of the Duchesse." "Ceix and Alcion" is not mentioned at all in the list in Chaucer's "Legend," and it is, therefore, obvious that Lydgate used that list pretty freely and from memory, or he would have copied it more exactly. Two other items in the "Legend" list Lydgate omitted entire.

Moreover, the professor also neglects the fact that "many a day agoon," in the first line, is certainly a recollection of the line from the "Man of Law,"

> In youthe he made of Ceys and Alcion.

It is "many a day agoon," because it was in Chaucer's youth. But the "Hous of Fame" was not written in Chaucer's youth.

(2.) Professor Skeat, as his interpretation above shows, implies that Lydgate was so good a Dante scholar as to recognize at once the likeness to Dante's work in the "Hous of Fame." Now, Mr. Paget Toynbee, the best of Dante scholars, can find very little likeness to Dante in Chaucer's poem, so little, in fact, that, while he offers no other solution, he does not believe the "Hous of Fame" is meant by "Dant in English." Would Lydgate, who was not a thesis hunter, have seen the resemblance?

But Lydgate knew Dante, as he himself says, only "by a report, verray celestiall." There is no evidence that he could read a line of Italian. All he knew was the general knowledge that Dante's book treated of heaven, purgatory, and hell, plus what he could glean about Dante in his one *thesaurus*, Chaucer's works. At least, his mentions of Dante, printed by Mr. Paget Toynbee, give us no right to claim more for him; and no scholar has ever dug out a single translated line of Italian from his works.

Now, the only hints Chaucer throws out as to the nature of Dante's compositions are two. In the "Hous of Fame" he says, if you want to read about torments in hell, go to Virgil, Claudian,

> Or Daunte that hit telle can.

At the end of the piteous tale of Ugolino of Pisa, in the "Monkes Tale," he says:

> Who so wol here it in a lenger wyse
> Redeth the grete poete of Itaille
> That highte Dante, for he can al devyse
> Fro point to point, not o word wol he faille.

All that Lydgate could learn of Chaucer about Dante, then, was that the Italian poet told piteous tales of folks in pain and anguish. If Chaucer was like Dante, then it must have been in telling piteous tales. Now the "Hous of Fame" is not piteous; it is a light-hearted *jeu d'esprit*. The piteous stories are, obviously, "Ceix and Alcion" and "The Dethe of the Duchesse." The second line of the stanza is simply a parenthesis. The sense of the stanza is: "Chaucer wrote a long while ago, like an English Dante as he was, the piteous story of 'Ceix and Alcion,' and 'The Dethe of the Duchesse'; and he also occupied himself with the translation of 'Le Roman de la Rose.'"

Such an interpretation accords, and it is the only one which accords, with Lydgate's well-known habit of inserting parenthetical lines to fill out the necessary rhymes in his stanza. In this very *ballade* before us, the next to the last line is such a one. It could be stricken out without loss. The second line is of the same class, though it conveys a parenthesis of more thought-value.

(3.) If the "Hous of Fame" is not elsewhere mentioned in this list of Lydgate, neither is "St. Cecile" or "The Wretched Engendring of Mankind," both (the latter in the A-version only) mentioned in the "Legend" list which Skeat supposes Lydgate to be using. The plain truth is, that Lydgate did not have a reference library at his disposal—it is doubtful whether the "Legend of Good Women" could have been permitted to enter the "smal librarie" of Bury St. Edmunds—and he forgot, as other good people do, some items of his youthful reading, among them the "Hous of Fame." Instances of Lydgate's careless habits in quoting from Chaucer and others could be multiplied *ad nauseam*. Like Wal-

ter Scott, when he could not remember, he made up his quotations. He would have been the last, however, to mystify his readers with an unfamiliar title for a famous poem.

If Mr. Paget Toynbee had printed the whole stanza, instead of the first two lines only, this explanation must, I think, have occurred to him.

HENRY NOBLE MACCRACKEN.

New Haven, Conn., September 14

A QUOTATION FOR THOSE WHO DASH TO THE POLES.

TO THE EDITOR OF THE NATION:

SIR: A picturesque incident in Cook's account of his visit to the North Pole is given where he describes his "cultured" Eskimos as dancing with delight beneath the "Big Nail." It should seem as if the imagination of that people had conceived an elongation of the earth's axis as still projecting from the skies like a sort of "boreal" icicle, or mammoth ethereal stalactite, pointing toward that same pole to which Peary has nailed the Stars and Stripes. Now, it but remains for some hardy "aviator" to affix the same symbol of perseverance to the remaining and pendent remnant of this somewhat attrited axle-tree.

In our admiration for the "grit" of these Arctic and Antarctic explorers, let it not be lost from sight that their exploits are of value chiefly as tests of human endurance; nor let us lose from consideration one hateful trait of this sort of human activity. Polar exploration in the north is accomplished only by the use of picked specimens of dogs, the best attainable in strength and courage, who strain every nerve to aid their masters in dragging their loads over the interminable ice-floes, and for this their only reward is to be knocked on the head and devoured by the remaining members of the party. Every report shows them intelligent and faithful, eager to do their master's bidding, his "poor earth-born companions and fellow mortals." In maintaining decencies in our relations with the domestic animals, the world does not seem to have progressed far from the time when the Jews felt it unbecoming to seethe a kid in his mother's milk, or muzzle the ox when he treadeth out the corn.

In Antarctic exploration Lieut. Shackleton made use of Mongolian ponies, which came to the same end as the dogs on similar journeys; and the loss of one of these down a crevasse in the ice prevented that explorer from proceeding nearer than a hundred miles from the South Pole.

In Prior's "Alma" is an appropriate quotation for an expedition thus equipped:

> I say, whatever you maintain
> Of Alma [mind] in the heart or brain:
> The plainest man alive may tell ye,
> Her seat of empire is the belly;
> From hence she sends out those supplies,
> Which make us either stout or wise;
> The strength of every other member
> Is founded on your belly-timber.
> . . . . . .
> Was ever Tartar fierce or cruel
> Upon the strength of water-gruel?
> But who shall stand his rage and force,
> If first he rides, then eats, his horse?

Literature.

EARLY SATIRE.

Verse Satire in England before the Renaissance. By Samuel Marion Tucker, Ph.D. New York: The Columbia University Press. $1 net.

This title is to be construed literally. The work deals with verse, not with prose, and it stops just on the threshold of our modern period. Still more significant, it deals with satire in England, not with satire in English. Thus the reader is reminded, more systematically and persistently than in ordinary histories, of the fact that England was for upwards of three centuries, from the Conquest to the death of Gower, tri-lingual. We get satire in Latin, in French, in English. On the other hand, with theoretical inconsistency, but with practical good sense, the author has included verse satire written in the English of Scotland.

The present work is largely of the nature of pioneering. For, though the bibliography at the end bulks somewhat large, not one of the books cited, not even Alden's "Rise of Formal Satire," could have yielded any very direct guidance. It would be grossly unjust, therefore, to give undue prominence to occasional faults of commission or omission. If we call attention to a few, it is with the intent rather of helping the reader than of troubling the writer.

To the list of mock-epics considered in the general introductory chapter, pp. 20 seq., we should add the Bentley-Wotton episode in Swift's "Battle of the Books." Though printed by Swift as prose, its blank-verse grandiloquence is a delightful parody of the heroic style. To the satire on literary themes, p. 33, we should add Byron's "Vision of Judgment," or rather substitute it for his tyronic and incoherent "English Bards and Scotch Reviewers." And to the "Parnassian" poems we should certainly add, for dramatic satire, "The Knight of the Burning Pestle," the three Cambridge "Parnassus" plays, and "The Rehearsal." At p. 202, we read that "Testaments [*i. e.*, Wills] galore had appeared through the preceding two centuries," but that Lyndsay seems to be the first to use the form as a vehicle for satire. In the first place, "galore" is not a fit term in sober writing. Further, we would remind both author and reader of Piers Plowman's "Testament," in Passus vi. When, p. 214, Bale's "The Three Laws" is described as "not an easily accessible play," we are puzzled. Surely the *Anglia* ought not to be out of reach of any one, who undertakes to handle the history of English literature; besides, Schröer's *Anglia* edition can be had in separate form. Again, p. 192, the phrasing used in the text to describe the "Image of Hypocrisy" is unfortunate: "This ballad exists only in manuscript." Yet the footnote enables the trained reader to discover that the ballad was published (by Furnivall) in volume one of the Ballad Society. Even worse is the sentence, p. 53:

> It [the literature of Visions of Hell and Heaven] begins in English literature with the frequent references in the Anglo-Saxon prose of Aelfric and of Wulfstan; takes more formal shape in Bede's "Vision of Furseus" and "Vision of Drihthelm" in the "Ecclesiastical History"; and appears in the "Cynewulfian Poems."

Such an utterance leads one to suspect that the author's ideas of Old English are of the haziest. To begin with the end, the "Cynewulfian" poems do not present the literature of Visions. True, they touch upon the pains of the damned and the joys of heaven; that, however, is very far from constituting a Vision. In the next place, the references in Aelfric and Wulfstan do not begin this form of literature in England. Aelfric and Wulfstan are only feeble reflexes of Bede.

In general, pp. 53-55 give much occasion for shaking of the head. One perceives that the author has not gone to the bottom of his subject. Without entering into any argument, we would submit to him the absolute necessity of setting up several distinct categories for mediæval literature. There is the literature of Visions of Hell and Heaven, purely Christian in substance, but influenced by well-known passages in the "Odyssey" and the "Æneid." Then there are the Allegorical Pilgrimages, of which the best known representative is Bunyan's "Pilgrim's Progress"; also purely Christian. Further, there are the Wanderings and Voyages, mythological and non-Christian; for example, Brandan and Maeldune. Finally, there are the stories of an Earthly Paradise, or Land of Cockaigne. To suggest, p. 55, that the French and English *fabliaux* of this last genre may be parodies of the Visions of Hell, is to misapprehend the data of mediæval literature.

Our chief quarrel with the author concerns his attitude towards satire in general; in particular, towards Chaucer and Langland. What is satire: can it be strictly defined? In some places our author seems to admit the possibility of strict definition; in others, to evade the attempt. Again, is it possible to draw any sharp and fast line between satire and humor? Or to admit, with the author, p. 5, that satirical poetry is *destructive* in its criticism, while all other forms of poetry are *constructive*? "This peculiar and individual tone sets satirical poetry apart." Or to admit, pp. 13-14, that prose-satire offers "a wider field to the imagination through its freedom from metrical restrictions"? On these and many similar points we can not enter into a detailed discussion, but must rather content ourselves with lay-

ing down a single general principle. What we call wit, humor, satire, is merely a varying manifestation of the realistic spirit which dwells upon the incongruities of human life. These incongruities are always present. There is always the contrast between the real man and the man as he appears to himself; always the contrast between what the man seeks to accomplish and what he does accomplish. According as we present the incongruity in a spirit of friendliness, of compassion, of superiority, of opposition, we are humorous or witty or ironical or satirical. At bottom our realistic spirit is essentially the same. It is seldom a truly destructive spirit, any more than the spirit of lyric or ballad poetry is always truly constructive. Nor is it essentially a reformatory spirit. We doubt whether even Swift, in his "Tale of a Tub," or in "Gulliver," was really bent upon reforming people and things. At any rate, we devoutly hope that no one will accept the high-school doctrine that metre is a restriction upon the imagination. It was a great poet who taught "Das Gesetz nur kann uns Freiheit geben." And it was the same Goethe who confessed that certain utterances are possible only in poetry, because it is poetry; prose were too brutal.

Urging our broader interpretation of the realistic spirit, we must contend that our author's estimate of Chaucer and Langland is painfully inadequate. We refuse to accept a treatment of Chaucer's satire which restricts itself practically to the "Canterbury Tales" and ignores "Troilus and Cressida." Granted that the portrait of the Wife of Bath is magnificent, the standing delight of all true Chaucerians, must we also admit that "No other such portrait exists in English satire; and other mere 'satires against women' compared with this immortal picture become colorless and feeble"? The Wife of Bath is clear-cut because obvious; Cressida, indubitably the satirical portrait of the woman who, whispering I'll ne'er consent, consented, and then cheerily slipped out of a troublesome entanglement, is developed on subtler lines, with a wealth of psychological analysis which is equaled only by Shakespeare, and surpassed not even by him. Then there is Pandarus, most immoral of immortals, as fertile in expedients as the wily Ulysses. There is also the delicate perfume of court life suggested in Helen and Deiphobus. In brief, Chaucer's "Troilus and Cressida" is not only his most finished and most genial work, but the shrewdest satire ever penned in English.

Of "Piers Plowman" we need only say that Langland's satire is scarcely inferior to Chaucer's. The language, true, is cruder, the metre compares unfavorably with Chaucer's limpid verse-flow. But the portraiture of the incongruities of political, judicial, ecclesiastical life, of all classes from king to beggar, is genial in conception and handling. The one poet satirizes in the spirit of the courtier, the other in the spirit of a man in close touch with humanity at large.

Again, "The Owl and the Nightingale," the most remarkable product of the thirteenth century, receives scant courtesy at p. 57. Had our author utilized Wells's edition, instead of merely citing it in a footnote, he would not have followed the "great authority" of Professor Courthope by characterizing the poem as a scolding-match between the strictly monastic party and the latitudinarian. Owl and nightingale are much more than advocates of contending parties in the Church; they are symbols of the eternal contention between the life which scorns delight and leads laborious days, and the other life which sports with Amaryllis in the shade. Milton does not leave his readers in doubt concerning his attitude towards this burning question. But the author of "The Owl and the Nightingale," with delicate self-irony, makes us feel that somehow he cannot help sympathizing with both sides.

The faults of this history of Satire in England are thus not inconsiderable. Yet, in the main, the work has decided merit. It is scholarly and is accurate in details. The general student and reader will find it helpful. Its wealth of illustrative quotations makes the perusal stimulating.

CURRENT FICTION.

The Half Moon. By Ford Madox Hueffer. New York: Doubleday, Page & Co.

The introductory dedication to this story is better than the story itself: a very accomplished little essay, rather in the Stevensonian manner, on the historical setting of Hudson's exploit. It is inscribed to Mr. W. A. Bradley, who, says Mr. Hueffer, suggested to him that he should write a story about the voyage of the Half Moon. The resulting narrative is a creditable exercise in its kind—better than might have been expected of a novel written, in a sense, to order. It has not the mark of spontaneity, but is the product of a carefully considered and tolerably successful artifice. Mr. Hueffer has evidently little nautical knowledge or enthusiasm, or he would not say to begin with, "a voyage is not a very inspiring thing to write about," and he would not make such vague fantastic work of the actual experiences of the Half Moon at sea. But the study of mankind, he observes, is man. His object is to throw light upon the kind of people who made the voyage in question, and the kind of conditions in the old country which made that voyage possible. What he offers in his dedication upon these heads is, we say, so good as to tempt the wish that he might have gone on, expanded, written a history instead of a romance. For the human persons of the tale are, it must be confessed, mere shadows. Hudson is a rather grotesque figure, neither admirable nor imposing. The centre of the stage belongs, not to him, but to one Edward Colman of Rye Royal, in whom the story-teller is interested partly because he comes from Rye, and partly because he was the first European to lose his life upon the waters of the Hudson. Colman, though a merchant, is a Baron of the Cinque Ports. His chief profits come from "owling" or smuggling wool, which is against the King's laws, but not against the traditions of the bumptious little town of Rye. However, he is betrayed and his life set in danger through the hatred of a woman scorned. He flees to Holland, and presently becomes one of Hudson's companions in the Half Moon. The woman's hatred pursues him; she is a witch, and finally destroys him by her spells, while the width of the Atlantic separates them. The motive has appositeness as bearing testimony to the superstitions of Hudson's day, but it is overdeveloped. There is too much in the narrative as a whole of the convention of "historical romance," from the importance of its feminine machinations to the affectations of its archaic dialogue.

Poppea of the Post-Office. By Mabel Osgood Wright. New York: The Macmillan Co.

"Barbara," author of "The Garden of a Commuter's Wife," is possessor of a pretty vein of sentiment, and has here written a story of American village life, which is decidedly more engaging than is common with stories of the type. It has no special novelty of theme or structure. Poppea is a foundling whose foster-father is the postmaster of the village of "Harley's Mills." She grows to womanhood in ignorance of her true parentage, the eventual revelation of which casts an apparent obstacle in the way of her happy marriage. It is all made to come right in the end by means which are likely to be quite as satisfying to the reader as if they were novel.

But the idyllic quality of the narrative renders the matter of plot of little account. The really central figure is not Poppea, but the old postmaster, Oliver Gilbert. He is an ardent patriot, but a crooked leg has prevented his enlistment at the beginning of the civil war. Lincoln is his idol, and he has letters written by the great man in response to ingenuous missives of his own. The little Poppea is left on the doorstep of the post office on the night when the great news of the Monitor's success against the Merrimac had been receiv-

ed. Gilbert accepts the responsibility for the child as a fulfilment of Lincoln's prophecy—that if he were unable to go to the front, God would find some other wrong for him to right, by his own door. He brings her up faithfully as his daughter, teaching her to think of the two whom he has loved and lost as her own mother and sister. Her discovery of the truth alienates her from him for a time, but she presently comes to see that there has been nothing selfish in his motive. The worse possibility of her parentage is disproved, and she eventually (after, as it seems, some unnecessary misunderstandings) marries the nice boy of her choice. The villain of the piece is, according to current fashion, the rich man of the community. He bears the unmitigated malice of the stage Crœsus, and, like that worthy, dies repentant.

Sir Guy and Lady Rannard. By H. N. Dickinson. New York: Duffield & Co.

A wealthy young baronet with political ambitions is the no unparalleled hero of this narrative. For her promise of serviceableness, social and political, he marries the daughter of a West Kensington vicar. She is a handsome and capable girl, and, for her part, marries him for his wealth and position. It very soon appears that he does not care for intelligent aid from her, and they are estranged. He wins a seat in Parliament by an elaborate system of bribery, which, as he is devoid of moral sense, he considers a mere application of business methods to politics. It is unfortunate, however, even from his point of view, that the secret of his success should leak out. The cold shoulder is given him by the leaders of his party. His passion of self-aggrandizement becomes a mania, and his mind is gradually unhinged. Meanwhile, the wife, recognizing his moral and mental instability, has come to feel for him a passionate devotion; and it remains for her to guard the wreck of him from the harsh scrutiny of the world. He is presently released by the knife thrust of a mad socialist.

These are familiar enough materials; but the present treatment of them is not without originality. The vitiating consideration lies in the mental rather than in the moral irresponsibility of Sir Guy. He is too obviously unbalanced at the outset greatly to arouse one's interest, unless as a pathological study. But it is, after all, the figure of Lady Rannard upon which the attention is focussed; here is a figure of pathetic—almost of tragic—moment. Nowhere more movingly in recent fiction has been depicted that magical transformation of the mature and self-centred virgin into the devoted wife. What seems at first to have been a travesty of marriage eventually discovers itself as a true and unbreakable union—a miracle as stupendous, if not quite as common, as the miracle of birth or of dawn.

Joan of the Hills. By T. B. Clegg. New York: John Lane Co.

It is a thankworthy thing that there still live—mainly in England—writers of a now rare type of novel from which are absent machinery, the stock market, politics, king-making. Here is a story of Australian life led up to by admirably rendered London scenes. Here are the good old motives—a chivalrous and miserable marriage, a crisis, and a new start for father and son in Australia. Here is a love story with its rough course; here are scenes in a country store and on a cattle-station; journeys in bullock carts and on horseback; a fire in the bush; a cave of safety. Here are figures, too, that belong to the good old realm of story: a hero, conscientious but a postponer of painful duty, a fine, open-air heroine, and the heroine's father, a skinflint Scot, whose hidden vein of goodness is unexpected enough to provide many of the surprises of the tale. The secondary characters are uncommonly well drawn, from the hero's Lincoln's Inn brethren to the little Irish sergeant in Australia, and even to the "soft-goods" clerk. Though it deals with topics pleasantly far from modern clatter, this novel lacks, in its swing and briskness, nothing either of originality or modernity.

A GREAT PHILANTHROPIST.

Letters and Journals of Samuel Gridley Howe. Edited by His Daughter, Laura E. Richards, with Notes by F. B. Sanborn. Vol. II. Boston: Dana Estes & Co. $3 net.

The second volume of Samuel Howe's Memoirs is of more general interest than the first; it carries on the history of his life from 1832 to its close in 1876. During that period he resided in Boston and its vicinity, took a prominent part in the stirring intellectual and political movements of the time, and carried through a great work of practical philanthropy. A physician, a man of acute perception, of strong sense, and of altruistic and humanitarian instincts, he set to work to smooth a way for the helpless and crippled. He was one of the pioneers and most effective workers in teaching the blind, the deaf, the dumb, and the idiots—and all this without false sentiment, without fuss. His personal appeal was irresistible not only to those whom he was leading to light, but to those whose support he demanded in the cause of charity and justice. This was due in part to personal magnetism, in part to the confidence inspired by the practical and effective administration of the institutions he managed. No man was ever more ready with compassion and help, and yet so free from illusions—witness his refusal to join the Peace Society, notwithstanding the pressing solicitations of one of his most valued friends, Charles Sumner. He did not hesitate to tell another of his friends, Theodore Parker, whom he viewed at one time as the greatest American of his age, that a sermon he had listened to contained nothing but rhetoric and claptrap, a judgment that was doubtless as accurate as it was vigorous.

Dr. Howe was prominent in the ranks of the Abolitionists, and was a friend of John Brown. After Brown's capture at Harper's Ferry, Howe, in fear of arrest, went to Canada for a while. Thence he wrote to Sumner in November, 1859:

> It seemed to Andrew and other friends that the best chance for heroic old John Brown was the appearance of his having acted on his own motion and responsibility, and without the active coöperation of organized committees or prominent individuals in the North; hence that those whose names had been introduced and who were really able to do so should deny all knowledge of the Harper's Ferry plot. Being in that category, I published a card which you may have seen in the papers.

The fact was that Dr. Howe had just previously given Brown, by check, fifty dollars. "The evidence of the fact and my name fell into the hands of the enemy. This fact and another, that I had once sent him a rifle and pistols . . . made Gov. Wise and others believe that I was one of the chief instigators of Brown's raid." An attempt was made to have him arrested, and he found that, as he says, in Suffolk County he could not be protected from the marshal; the judges would not respect the habeas corpus. Out of Suffolk, he would have been protected by the people; but out of Suffolk he could do no good, and so he went to Canada, where he stayed till after "the dreadful 2d of December."

The letters of Dr. Howe given in this volume are occasionally of wide interest, and are occasionally graced with some lightness of style; but on the whole, the matter might well have been cut down to much smaller proportions. As a favorable specimen of his style, the following may be quoted from a letter to Charles Sumner, written during an English tour.

> Let me talk about home; dear old Boston; dear old friends; dear American institutions. For after all, Sumner, with its blaze of talent, its gorgeous wealth, its exquisite refinement, London could never hold in my heart or my mind so high a place as does Boston; because, measured by God's scale, it is not so high. I have not been so dazzled by the head and the front of the monster as to forget the fact that it has a tail which draggles along through the foulest slough in which humanity ever wallowed. . . . London and English institu-

tions elevate and refine the few at the expense of the many, far more than does an American city.

Passing a few minor criticisms that might be addressed to the editor of the volume, one may warmly recommend it to the reader. Even if one cannot accept Mr. Sanborn's dictum that Dr. Howe is to be ranked with men of genius like Emerson and Carlyle, he was a notable man and really great in his goodness. To read his record will make the reader himself feel a better man.

Dante's "Convivio" translated into English. By W. W. Jackson, D.D. New York: Henry Frowde.

This new translation of the "Convivio" is a welcome addition to the already remarkable English and American output of Dantesque literature. Dr. Jackson's volume, though modest in appearance, is a work of the first importance from the point of view of the serious student of Dante. An adequate and scholarly English translation of this comparatively little known work has long been a desideratum. A couple of English renderings of the treatise were already in existence when Dr. Jackson began his task, and a third was published shortly before the present version was completed. Two of these, namely, that of Miss Hillard, and that of Mr. Wicksteed, as well as the careful German version of Kannegiesser (published more than sixty years ago), are appreciatively mentioned by Dr. Jackson in his preface, as having been of occasional service to him in the revision of his own translation. Each of the two former has certain decided merits of its own, but unfortunately in both cases the merits are more than counterbalanced by serious defects, either of scholarship or of style, which have prevented the adoption of either as the standard English version of the "Convivio."

Even a cursory examination of Dr. Jackson's translation will suffice to satisfy the most exacting of critics that it is the work at once of an accomplished translator who is a master of his own tongue, and of a scholar who has made himself familiar with the several branches of knowledge with which Dante deals in this treatise. Ignorance of scholastic terminology was responsible for not a few of the blunders of preceding translators, which Dr. Jackson, with a more scientific equipment and a sounder judgment, has known how to avoid. As a single example of his more scholarly instinct in this respect we may cite his rendering of the phrase "uomo è legno animato" in the canzone prefixed to the fourth book of the treatise. *Legno* here has commonly been taken in the literal sense of "tree" or "trunk"; but Dr. Jackson is, we think, undoubtedly right in seeing in the word as here used by Dante the Italian equivalent of "hyle" (ὕλη), the mediæval "ile" in the sense of "matter."

The text followed by the translator is that of Dr. Moore, as printed in the third edition of the Oxford Dante (1904), which is the only text based on a systematic examination of all the known manuscripts. Dr. Jackson, however, displays no little critical acumen on his own account, with the result that in quite an appreciable number of passages he has been able to introduce emendations of his own, which are undoubted improvements, and at the same time are justifiable on palæographical grounds; indeed, that they are thoroughly sound may be inferred from the fact that the majority of them have received the *imprimatur* of Dr. Moore, who, as is well known, is preëminently cautious and conservative in matters of textual criticism. These emendations, which in several cases are merely changes of punctuation, but are none the less important on that account, are for the most part fully discussed in the notes at the end of the volume. In one instance we are inclined to think that Dr. Jackson in his editorial capacity has been over-venturesome, namely, in adopting from Fraticelli an emendation of Witte's in the seventh chapter of the first book, which involves a violent departure from the reading of the manuscripts, though it may, as the translator urges, "give exactly the sense required." If once the door be opened to emendations of this hazardous description, the tendency is inevitably to relax more and more from that scrupulous respect for manuscript authority, which should be the guiding principle of all textual criticism. Few works have suffered more than Dante's "Convivio" from a disregard of this principle. The greatest sinner in this respect was Giuliani, whose arbitrary alterations of the text of this and other works of Dante, to suit what he considered (very often quite mistakenly) to be "the required sense," created for a long time a strong prejudice against Italian editions of Dante's works, which has only been removed of recent years by the scholarly labors of Rajna, Barbi, Parodi, and other well-known Italian editors and critics.

In an interesting and able introductory essay, Dr. Jackson dwells on the importance to the Dante student of a knowledge of the "Convivio," which, as he observes, fills the "central space" in the poet's history, and is the link between the "Vita Nuova" and the "Divina Commedia." The same essay contains a succinct exposition of the scholastic philosophy of the age, some acquaintance with which is essential to an intelligent appreciation of Dante's methods of composition, and to an understanding of his (from our point of view) uncritical cast of mind. A full and clear "summary of contents" is prefixed to each book of the treatise, and appended is an "index of subject-matter." The latter, which is, we believe, the first serious attempt of the kind, is an excellent specimen of what might, and, indeed, should, be done for the whole of Dante's works. A complete subject-index, as a complement to the index of proper names and notable matters appended to the Oxford Dante, would be an invaluable adjunct to the existing Dantesque books of reference, two of which (the admirable concordances to the "Divina Commedia" and to the "Canzoniere" and Italian prose works), it is a pleasure to recall, are the work of American scholars.

The present volume, as is the rule with works issued from the Clarendon Press, is carefully printed. The only oversight we have noted is the omission of the page references to three of the notes on the third book.

Pierre Le Tourneur. By Mary Gertrude Cushing. New York: The Columbia University Press.

Judged by current standards, the study of Le Tourneur, signed by Dr. Cushing, is a creditable specimen of those "valuable contributions, . . . deserving to be accepted in partial fulfilment of the requirement for the degree," etc., etc. Le Tourneur was one of the minor men of letters who saw, after the issue of the "Lettres Philosophiques," and the beginnings of Anglomania in France, the trend of readers and of publishers. Dutifully he went outside of France for his material. He who had published a *discours* or two, and some *éloges*, he who had gained a fragile reputation as a writer of *contes*, now turned toward Italian verse, and toward the literatures of Germany and of England. His part in acclimatizing Italian and German literature was so slight that we may fairly disregard it here. And his connection with English letters may be summed up under three heads: his work as a translator of (1) novels and miscellaneous works; (2) Young, Hervey, and Ossian; (3) Shakespeare. Our discussion is narrowed by Dr. Cushing's admission that "Le Tourneur's greatest achievement in the translation of novels was his version of 'Clarissa Harlowe,' which appeared in 1775." The classic translation of "Clarissa" was, of course, that by the Abbé Prévost, which preceded Le Tourneur's by upwards of thirty years. Le Tourneur's less abridged and less "adapted" version of the familiar story proved a drug on the market. It did not reach its second edition until 1802; though these were the days when, as Collé said, "As for novels, no one will touch them if they be not translations from the English." Judging it on its

merits, one is not surprised. Not even as a translator of the Graveyard Poets was he an innovator. Portions of Edward Young's masterpiece had appeared in the magazines and in the little Amsterdam volume of "Pensées Angloises" (1769). It was Le Tourneur's privilege to show French readers just how funereal—how tiresome, too—the "Night Thoughts" *in extenso* are. Le Tourneur did not take that opportunity. His likening Young to Pascal declares his critical astuteness; but he thought twice before giving a literal translation of Young. He took with his material the twin liberties of omission and rearrangement.

The "Night Thoughts" were followed by the translation of Young's "Œuvres diverses," Hervey, and Ossian. Le Tourneur's Ossian was as great a success as his Young. Portions of other British poets were put into French prose by this tireless penman. Thus Gray received his attentions; the first stanza of the rendering of the "Elegy" ran:

J'entends le son de la cloche funèbre qui annonce la fin du jour; les troupeaux mugissans marchent à pas lents, et tortueux vers l'étable; le laboureur fatigué regagne avec effort sa chaumière, il abandonne l'univers à l'effroi des ténèbres et à l'horreur de mes réflexions.

Comment is unnecessary.

These distinctions cannot be denied Le Tourneur: that he first gave a translation, not simply of separate plays of Shakespeare, but of the "Œuvres"; that he first sought sharply to distinguish the words *romantique*, *romanesque*, and *pittoresque*, at a time when the difference was felt, but usage had not yet very firmly established itself. As for the Shakespeare, even Dr. Cushing lays much more stress upon the fact that here was the first complete rendering in French than upon any merit in the performance itself. Voltaire emptied the vials of his wrath upon both Shakespeare's and Le Tourneur's heads; this circumstance is certainly the translator's chief distinction. Such purely historical significance as Le Tourneur has as the first "complete" translator of Shakespeare is minimized by the mediocrity of his performance.

Within the limits of her subject, Dr. Cushing seems painstakingly to have covered her ground. A very large part of Le Tourneur's importance must be associated with his adaptations of the Graveyard School; although, as Professor Baldensperger has written in an essay to which Dr. Cushing makes no reference, "Les 'Nuits' d'Young n'ont point suscité directement de chefs-d'œuvre chez nous." Dr. Cushing does not fail to point out that Le Tourneur's Young exercised a considerable influence upon French literature:

It was the favorite reading of Robespierre; Camille Desmoulins read it the evening before his death, thereby bringing upon himself Westermann's pleasantry, "Tu veux donc mourir deux fois?" Mme. de Staël knew and appreciated Young, and there are echoes of his philosophic melancholy in "Corinne" and her tragedy, "Jane Gray," and, later, Chateaubriand showed the same influence in "René" and "Atala."

Lamartine's poetry is cited; why not the early work of Hugo, as well? Such matters as these are not unrelated to Le Tourneur's significance, such as it is. It is only as historical importance is attributable to them that his translations are worthy of any examination at all. Now that a respectful hearing has been won for him, the translator is likely to sink back again into the well-earned oblivion whence he has been rescued. In the words in which he translated a verse of the Rev. Edward Young: "Quel silence absolu! quelle obscurité profonde!"

George Meredith in Anecdote and Criticism. By J. A. Hammerton. New York: Mitchell Kennerley. $4 net.

It would be easy to disregard this book as a collection of unsifted rubbish. To heap together a vast mass of extracts from newspaper columns and critical reviews, with thin layers of comment to unite them, may be a labor of pious assiduity, but is not likely to produce a work of finished excellence. Mr. Hammerton tries to give his product some semblance of order by sorting out his material under various chapter heads, but the material itself is so often of a mixed character, anecdote and criticism naturally flowing together in the original articles, that the order is not far removed from original chaos. Yet withal we regard the book as distinctly valuable and even to a certain degree, despite the necessary repetition of ideas, interesting. It is, or will be, valuable as a storehouse for the future biographer or critic of Meredith, who will here find much of the toil of investigation done for him. It is interesting for the critical question suggested by its very heterogeneity.

As we read the quotations from one admirer after another—detractors indeed scarcely figure—we are confronted by this curious paradox: almost without exception they deny to Meredith the qualities formerly expected in a great writer and then place him on a pedestal in spite of, sometimes because of, his defects. Thus, in his sledge-hammer style, W. E. Henley, his stanchest admirer, characterizes him as

one of the worst and least attractive of great writers, as well as one of the best and most fascinating. He is a sun that has broken out into innumerable spots. The better half of his genius is always suffering eclipse from the worst half. He writes with the pen of a great artist in his left hand and the razor of a spiritual suicide in his right. He is the master and the victim of a monstrous cleverness. . . . He is tediously amusing; he is brilliant to the point of being obscure.

After such a douche of oxymorons we shall be ready to accept the paradoxical manner of Oscar Wilde, in his famous dialogue on "The Decay of Lying," as an attempt at sincerity:

Ah! Meredith! Who can define him? His style is chaos illuminated by flashes of lightning. As a writer he has mastered everything except language; as a novelist he can do everything, except tell a story; as an artist he is everything, except articulate.

Yet to Wilde this inarticulate artist is "the most supreme writer of fiction, it may be, that we have ever had." Perhaps the nearest approach to a solution of this riddling paradox is given by Mrs. Alice Meynell:

There are no disheartening shortcomings or boundaries in these large and vigorous poems [she might add "and novels"]. If every poet must have one of two demerits —faults or limitations—Mr. Meredith is to be congratulated on having faults, and not limitations. To our mind the possession of faults is preferable to that of limitations. At times he frees his reader's thought, sets him above the poverties of time and place, and asks him, as Virgil asked Dante in an eternal world, "*Che pensi?*" "What thinkest thou?"

To such a distinction one might reply that a fault in art is a real limitation; that if an apparent fault does not limit an artist's efficiency, it is, properly speaking, not a fault. But in reality Mrs. Meynell had in mind a discrimination of effects, which suggests a far-reaching change from the older to the more modern aims of art. The question is too large, too vague, perhaps, for summary discussion here, but its nature may be intimated by a simile. The older art, one may say, undertook to feed the emotions from below in their depths, as a spring sustains a lake; whereas the modern effort is to animate the surface, as a breeze ruffles the upper water into a brisk activity. The petulance, and broken lights, and wanton obliquities, and licentious cleverness of Meredith are in fact an integral part of his art; they are faults only by reference to a canon which had other and, it must be added, deeper designs than his. They are an efficient instrument in his treatment of the perplexities rather than the fundamentals of life, and in his desire to agitate the mind with "the rapture of the forward view" rather than to stay it on the foundations of an immutable past.

Five Months in the Himalaya: A Record of Mountain Travel in Garhwal and Kashmir. By A. L. Mumm. With illustrations and maps. New York: Longmans, Green, & Co. $6.

The expedition described in this sumptuous volume was due to the in-

itiative of Lord Curzon, who, shortly before his resignation, suggested that the exploration of Mount Everest should be undertaken by a competent party under the auspices of the Royal Geographical Society and the Alpine Club, and promised the assistance of the Indian government. The party was formed, consisting of Dr. T. G. Longstaff and Major C. G. Bruce, both experienced mountaineers in the Himalaya, and the author, late honorary secretary of the Alpine Club; but from the refusal of Lord Morley to permit them to enter Tibet, whence was the only possible means of access to the mountain, the original design was given up and the exploration of a little-known region in British territory was undertaken. This was in the district of Garhwal, its attraction being that it contained the highest summit, Nanda Devi, in British India, and is unsurpassed "for individuality and striking and characteristic features of configuration." A large area at a great height was explored and mapped, the crowning exploit being the record ascent by Dr. Longstaff of Trisul, 23,406 feet, "the highest mountain in the world, of which the complete ascent is undisputed," and for which the Royal Geographical Society awarded him the Gill Memorial. The last part of the five months was spent by Major Bruce and the author in climbing in Kashmir.

Naturally, the account of such exploration work cannot appeal to the general public, but only to the mountaineering enthusiast or to those especially interested in the Himalayan conformation. Still to the description of the various passes, peaks, cols, glaciers, and valleys climbed or observed there are added many details of camp experiences, which, together with the vein of humor running through the narrative, lighten it, beside giving a vivid picture of life amid the eternal snows. It may be noted that the chief symptom of "mountain sickness" at very high altitudes was apparently great mental depression. The larger part of the time was spent in uninhabited regions, but when the natives were encountered, something entertaining or instructive is often told of them. For instance, referring to the strange uses to which the mountain Kashmiris put the roofs of their houses built against a steep slope, he says:

> I have seen a man on horseback select a house-top as a halting-place, when he wanted to get off and rest, and they seem to be the invariable place used for purposes of assemblage and conversation.

Mr. Mumm was the photographer of the expedition, and the reproductions of the pictures taken by him, together with several by Dr. Longstaff, fully bear out the statements as to the extraordinary beauty and individuality of the regions explored. They are 75 in number, consisting of 4 panoramas, 24 full-page plates, and 47 collotypes on India paper mounted in the text, and are fully worth the cost of the book. There are also two excellent maps.

Notes.

The new publications promised by the Malone Society for this season include the following plays: "Patient Grissell," by L. Phillips; "Fidele and Fortunio"; "Iphigenia in Aulis," translated by Lady Lumly; "The Second Maiden's Tragedy," Warburton MS., and "The Virtuous Octavia," by S. Brandon. Another volume of the society's "Collections" will also be issued.

"The Wine of the Puritans, A Study of Present-Day America," by Van Wyck Brooks, is announced for early publication by Mitchell Kennerley.

"The Study of Religion in the Italian Universities," by the Rev. Louis Henry Jordan, in collaboration with Cavaliere Baldassare Labanca, professor of the history of Christianity in the University of Rome, will be published in a few days by Henry Frowde.

George W. Jacobs & Co. announce that each volume of their new series, "Love Tales of the Nations," will contain eight or more stories by representative writers of a particular country, and the titles thus far announced include love tales American, German, English, Irish, and Scotch.

Arctic discoveries can hardly lessen the popular interest in Lieut. Shackleton's narrative of his southern expedition, promised by the J. B. Lippincott Company for November. A less sensational travel book, but one which promises much of charm, is the "Isle of Man," by Miss Agnes Herbert (John Lane Company).

For publication in October, Doubleday, Page & Co. announce, among other books, "Actions and Reactions," by Rudyard Kipling; "The Poetry of Nature," by Henry Van Dyke; "The Philosophy of Dancing," by Luther H. Gulick; "Marie Antoinette," by Hilaire Belloc; "The Story of the Negro," by Booker T. Washington; "Grimm's Fairy Tales," illustrated by Arthur Rackham.

Under the title, "Yale Readings in Insurance," the Yale University Press will publish this month two volumes edited by Prof. Lester W. Zartman: one devoted to life insurance and the other to fire and miscellaneous insurance. The original volumes of "Yale Insurance Lectures," which appeared some five years ago, are now out of print, and the present publication has been preferred to a mere reprint of the old lectures.

The list of books to be published by the University of Chicago Press during the season 1909-10 includes: "English Poems: The Elizabethan Age and the Puritan Period," by Walter C. Bronson; "The Psychology of Prayer," by Anna Louise Strong; "A Modern City: The Activities of Providence, Rhode Island," edited by William Kirk (a collection of essays by members of the faculty of Brown University); "The Armenian Awakening," by Leon Arpee; "Source Book for Social Origins: Ethnological Materials, Psychological Standpoint, and Classified Bibliographies for the Interpretation of Savage Society"; "Studies in Galilee," by E. W. C. Masterman; "The Child and His Religion," by George S. Dawson; "The Cameralists," by Albion W. Small; "Biblical Ideas of Atonement," by E. D. Burton, J. M. P. Smith, and G. B. Smith.

A selection from the earlier criticisms of George Meredith's poems and novels, made by Maurice Buxton Forman, is to be published by Chapman & Hall. The essays range in subject from the "Poems" of 1851 to the "Poems and Lyrics of the Joy of Earth," and from "The Shaving of Shagpat" to "The Tragic Comedians." The authors include Swinburne, George Eliot, W. M. Rossetti, Kingsley, James Thomson ("B. V."), Richard Garnett, Henley, Hutton, and Mark Pattison.

The official exhibition of literary material relating to Hudson and Fulton has recently been opened at the Lenox Branch of the New York Public Library. It consists of three parts—books and manuscripts, maps, and prints. The large collection of books covers fields devoted to Fulton, to his inventions, to early steam navigation, to Hudson, the discovery of the river, and its later history. Among those relating to the discovery are two of note: one is the "Historie der Neder-Landscher ende haerder Na-buren," by Emanuel van Meteren, 1614, which contains the first printed account of the finding of the Hudson River. The first detailed narrative is in "Purchas his Pilgrimes," 1625. There are many signed manuscripts in the writing of Robert Fulton, an original plan, and several books on engineering subjects by him. Among the latter is the copy of his treatise on canal navigation with the letter of the author presenting it to Napoleon Bonaparte. The maps are few in number, but include reproductions of the earliest, and several valuable originals showing New Netherland and vicinity before 1600. The section devoted to prints, which is by far the largest, consists of a few portraits of Hudson, mostly based on Count Pulaski's painting in the City Hall; portraits of Fulton, mainly copied from West's well-known painting, and numerous pictures of steamboats both prior and subsequent to 1807.

Old favorites hold their own, and though this is the anthology's heyday, we are glad to see once more a new edition of the "Golden Treasury" (The Macmillan Co.). This time there is, too, a slight spice of novelty; for we have the first and the second series bound up together in one compact volume. In the original dedication to Alfred Tennyson, Palgrave expressed a hope that his book might prove "a lifelong fountain of innocent and exalted pleasure, . . a storehouse of delight to Labor and to Poverty." That was almost half a century ago, and no one denies, to-day, the realization of his not unambitious desire.

In editing the "Poems, Letters, and Fragments of Kirke White" for the Muses' Library (E. P. Dutton & Co.), John Drinkwater has done well to omit the less interesting material gathered together by Southey in his exaggerated esteem for the aspiring and ill-fated poet. It is true, as Mr. Drinkwater says in his introduction, that White has been too harshly depreciated or neglected of late years, following his earlier undeserved popularity. No one to-day would try to set White up as a great poet, but there are passages of minor

sublimity in his works, slight anticipations of romance, and withal a purity of sentiment that are still capable of interesting those who care to read him. Not the least entertaining piece in the volume is White's letter to John Charlesworth on the loneliness of a student's life at Cambridge. We can see no reason for including his prose fragments.

When prairie chickens nested in the heart of Chicago, and Indians hunted over the sites of most of the great Western universities, Miami had already been conceived, named, and endowed with lands by the General Assembly of Ohio. In commemoration of the hundredth anniversary of its birth Mr. Alfred H. Upham recalls its ancient history in a volume entitled "Old Miami," with the rather startling sub-title, "The Yale of the Early West" (The Republican Publishing Company). Though the style of the book is familiar and tinged with slang, and though the substance is unnecessarily slight, there are not wanting little flashes of light into the dark backward of Western culture. Fifteen years after its inception Miami University was actually opened for students in the auspiciously named village of Oxford, near the Indiana line. In those Arcadian days youthful pioneers hungering after knowledge could be filled therewith from November to May at a total cost of $93, including, beside tuition, servant's hire, candles, wood, washing, and board. To prevent interference with the regular curriculum, however, the faculty found it necessary, even with that simple standard of living, to enact laws against duelling, dancing, and the possession of backgammon boards. Indeed, one of the statutes of 1842 indicates the presence among the undergraduates of some of those mancating Middle Westerners that Dickens found so obnoxious on his American travels. "No student," so runs the injunction, "shall wear about his person pistol, dirk, stiletto, or other dangerous weapon." With such timber to shape it is no wonder that the discipline was austere. "Found in bed after the rising hour"—such is the heading of one of the university black lists—and the academic day began at five! Yet under the mollifying influence of morning and evening prayers, and neighboring "female institutions," barbarism yielded rapidly to sweetness and light. Miami published one of the earliest literary journals; founded two or three of the oldest Greek letter societies; produced Benjamin Harrison; and was instrumental, says the historian, in the formation of almost innumerable matrimonial alliances. Best of all, perhaps, Miami University has lived down the onus of its name, and has become, says Mr. Upham, "a high-grade small college."

Professor Manly's "English Prose, 1137-1890" (Ginn), like his companion collection of English poetry, differs favorably from the general run of single-volume treasuries in the extent, the range, and the interest of its contents. The book, though not uncomfortably bulky, contains 539 double columns of text, equal to over 1,500 average octavo pages—ample material, in other words, to illustrate a full year's introductory course in prose. In the second place, it includes, beginning with the "Anglo-Saxon Chronicle," a considerable number of selections of historical importance, such as passages from the "Ancren Riwle," the "English Proclamation of Henry III," the translations of Wiclif, Froissart, Sir Thomas More, etc., which are difficult or impossible to procure at reasonable expense in quantities sufficient to accommodate large classes. Finally, Professor Manly has not bound up a mass of the first trite specimens that came to hand; but apparently has spared no pains to find examples which, with the help of even a moderately good teacher, can be made to impinge vividly upon the consciousness of a moderately good student—a quality very rare and desirable in a text-book. Now and then he has perhaps questionably sacrificed representativeness to interest; for example, Bishop Berkeley appears not as an idealist philosopher, but as the author of the piquant "Proposal for a College to be erected in the Summer Islands." The arrangement of the authors under the customary periods according to the date of their births is simple and satisfactory; but since this arrangement throws several of the selections out of their chronological order, it would have been well to supply in each case the date of publication. We inevitably miss a number of important writers—Baxter, Spencer, Mill, Huxley—and Professor Manly assures us that he laments such omissions more bitterly than any one else. Yet, all things considered—abundance, variety, interest, range, compactness, and legibility—this is decidedly the most useful thing of its kind in the field.

A fascinating account of the wonderful marine zoölogy of the South Californian coast, as seen from a glass-bottom boat, is given in the *National Geographic Magazine* for September by the naturalist, Charles Fred. Holder. The striking illustrations of the strange and beautiful creatures unconstrained in their habitat confirm his assertion that by this means of observation "a new and valuable ally to science education has been established." Ellsworth Huntington describes a journey in the region where Russia, Persia, and Afghanistan meet, in which he shows how much in evidence are Russian military preparations, in numerous army posts and colonies planted at strategic points, for an eventual advance southward to the ocean. There are also interesting illustrated accounts of visits to a mountain monastery in Thessaly to which access is had by means of a fishnet, and to a picturesque prehistoric ruin and cave-dwellings in New Mexico.

Impressions of Canada by English and French travellers from the Old World are interesting if not always convincing. Dr. Adrien Loir visited Canada in 1906, as a delegate to the Medical Congress held at Three Rivers. He spent his leisure in visiting different parts of the Dominion, and he has recorded his impressions in this volume ("Canada et les Canadiens"; Guilmoto: Paris). He confesses quite frankly, at the outset, that he landed at Montreal with little or no knowledge of the country. He was under the impression that the handful of French left in Canada after the conquest of 1759 had long since been thoroughly assimilated by the English. It was, as one can readily believe, something of a surprise to him to find that there were to-day two millions of descendants of the Canadians who stood about Montcalm in 1759, and that they had not only not been assimilated by their English-speaking fellow-countrymen, but that they clung tenaciously to their language, their religion, and their ideals; that they were in fact a nation within a nation. In his astonishment, Dr. Loir perhaps swung a little too far the other way, for there can be no doubt that in many ways English influence has been felt, and is being increasingly felt in the Province of Quebec. Dr. Loir made a brief visit to Ontario, and was properly impressed with the material progress of that well-to-do province, but one can see that he was impatient to return to his long lost "cousins" in the neighboring French province. After a visit to the governor-general, Earl Grey, whom he had met in South Africa, he spent several weeks in the Canadian Northwest, where he was equally astonished by the tremendous agricultural possibilities of the country, and the energy with which its resources were being developed. On the whole he concludes that Canada is still a long way from achieving homogeneity. The people of Ontario are English, and the people of Quebec are French, in language, manners, and ideals. As for Western Canada, Dr. Loir, like his eloquent fellow-countryman, Dr. Seigfried, is persuaded that its manifest destiny is to be absorbed by the United States. He is not quite clear as to what is to become of Eastern Canada, but we are left with the impression that the Eastern provinces may be permitted to remain under the British flag.

Mr. Thomas Gibson's "Library of Speculation and Investment" (The Gibson Publishing Co.) comprises seven little volumes compactly boxed, containing selections from his weekly and special market letters of 1907 and 1908, together with separate discussions of speculation and the increasing gold supply. The first letter, dated February 2, 1907, prognosticates "the market of the future." In large capitals he tells his readers: "There will be no panic." Under date of November 2, 1907, we read that "in March there was a 'silent panic' which carried prices to what looked like bargain figures." Whether the "silent panic" in his opinion became audible in the fall, we do not know; but in his Foreword, he admits his error in prophecy, but remarks that when the "words were penned, I had in mind rather a panic of *stock prices* than a panic of the *mind*"; and adds, "in truth, we had no great or panicky decline in stock prices in any one session." The deliciousness of this is equalled by his indignant remark on October 26, 1907, (p. 156) that: "Nine out of ten of the men and women who stand in line at the banks . . . cannot understand how an institution may be solvent and yet be forced to suspend. This is ridiculous but it is true." It certainly *is* ridiculous. The volume entitled "The Pitfalls of Speculation" contains an interesting article, "What 500 Speculative Accounts Showed." The accounts were mainly in Steel Common. Of the 500, 343 resulted in a net loss; 88 in a net profit; 52 closed comparatively even; and seventeen were unknown. Over 90 per cent. of those evidently worked by "systems" showed a loss. The total losses amounted to $957,000, and the total brokerage charges, commissions, interest, etc., to $275,000.

The late Rev. Dr. George Matheson's "Spiritual Development of St. Paul," which was published in 1890 and passed through repeated editions, having proved the most

popular of the many writings of its distinguished author, has been reprinted by Thomas Whittaker.

A welcome addition to the series of Oxford Classical Texts (Henry Frowde) is the "Hellenica Oxyrhynchia cum Theopompi et Cratippi Fragmentis." This text is edited—with a preface, critical annotations, an index of authors, and an index of names—by Prof. Bernard P. Grenfell and Arthur S. Hunt, Fellows of Queen's College, Oxford. In the same series, Prof. Hermann Diels of Berlin has edited the "Characteres" of Theophrastus. There is here the same richness of critical apparatus, and a preface of rather more formidable proportions. In the library of Latin texts, we have, besides, Cicero's "Orationes," to the number of eight, edited by Albert Curtis Clark, Fellow of Queen's College, Oxford. Once more the *Nation* calls attention to the high standard of typographical excellence and of scholarship maintained in successive issues of this "Scriptorum Classicorum Bibliotheca Oxoniensis."

Through Curt Kabitzsch, Würzburg, Artur Singer makes an interesting and altogether successful attempt, in his "Bismarck in der Literatur," to review the position thus far secured by the great German Chancellor in history and criticism. Nearly two hundred and fifty pages are required to present the material collected, which embraces thousands of foreign titles. French and English works are in the majority, but American, Russian, Spanish, Dutch, and Belgian writers are well represented. Italy, in proportion, seems to have been least conscious of the Master of the North.

The publication house of Stephan Geibel in Altenburg begins, under the general title of Deutsche Bürgerbibliothek für Jugend und Volk, a new collection of popular stories illustrating particularly the political, historical, and economic life of the German people. The editor, Arthur Wiegand, opens the series with a narrative called "Wilhelm," which gives a characteristic picture of German soldier life and the military condition of the Germans from the Roman period down to the present age.

Dr. Konrad Haebler has issued the first instalment of the third volume of his "Typenrepertorium der Wiegendrucke" (Leipzig: R. Haupt; see the *Nation*, Vol. LXXXI, p. 300). It contains the tables of the Roman types, repeating those given in the first part. A following instalment will contain the tables of the Gothic types used in non-German countries, with additions and emendations to the whole work. The Roman types, with their stiff and monotonous forms, have required a closer scrutiny than the Gothic, with their manifold individuality; and a much greater number of auxiliary characteristics have been brought out in the present volume.

A catalogue of the incunabula in the libraries of Leipzig, "Die Wiegendrucke der Leipziger Sammlungen," has been prepared by Dr. Otto Günther of the University Library and issued as a volume of the *Beihefte zum Zentralblatt f. Bibliothekswesen* (Leipzig: Harrassowitz). It is arranged according to the same principles as Voullième's catalogue of the incunabula in the libraries of Berlin, and is, like that work, to be regarded as a preliminary contribution to the general catalogue of incunabula in German libraries which is in preparation under the auspices of a Prussian special commission.

"The Oxford Student's History of India," by Vincent A. Smith (Henry Frowde), is intended primarily for students preparing for the matriculation examination of the Calcutta University but it may also be commended to the general reader as a clear and comprehensive outline of events. As the selection of topics conforms to the requirements of the latest syllabus, the history of the last hundred years receives but scanty attention; but space has been found, on the other hand, for brief treatment of Indian literature, art, and philosophy. There are seven good maps, but the few illustrations are condemnably cheap.

In consequence of the appeal of the rector of the University of Paris, Dr. Liard, the well-known liberal banker, Albert Kahn, who was already contributing 75,000 francs annually to young savants for travelling, has added 30,000 as an annual gift to the university, for the double purpose of rewarding more young scholars who have made important discoveries, and of paying the expenses of famous foreign scholars for lecturing in Paris or of French professors for lecturing abroad. Dr. Liard asked for the sum of two million francs, bearing 60,000 francs interest, for these purposes, and M. Kahn has now given one-half of the sum desired.

Science.

TWENTIETH ANNIVERSARY OF CLARK UNIVERSITY.

WORCESTER, Mass, September 16.

At most of the great anniversaries lately celebrated by American universities there has been much state and pageantry. Clark University, on the other hand, with a modesty becoming its youth and its size, has celebrated the twentieth anniversary of its foundation for three weeks with but the very slightest ceremonial. The money at its disposal was paid chiefly to a few of the most eminent men of science abroad and at home, and a careful programme for a week in each department, which usually held three sessions a day, was prepared. Most of those who gathered together were themselves professors, who lectured to each other in turn, the lectures being followed generally by free conferences. It is not surprising to learn that in the commendations of the university the chief theme was the uniqueness and high scientific tone of this mode of celebration, which many hope will mark a new type of festivity wherever science and a true university spirit are cultivated.

The mathematical discussions were inspiring. Prof. E. H. Moore of Chicago, in his lectures on "Postulational Methods in Mathematics," showed how every branch of mathematics is based upon assumptions, whose consequences are developed until they show themselves to be contradictory, and are then modified in such manner that the results of the assumptions in their final form at any stage of development shall be consistent. In this way the whole field of mathematics is unified and the different branches appear as so many particular sets of postulates and their consequences, each set being consistent in itself, and all the sets together making up a system of all the combinations that have proved themselves to be useful. His theory, profoundly and subtly suggestive, constitutes a contribution of first importance to mathematics, and serves, like Lie's theory of continuous groups, to unify various widely separated branches of mathematics, showing underlying relations hitherto not even suspected. The other lectures may be regarded as in some measure illustrations of these ideas. Professor Pierpont extended the notion of "integral" so as to include cases not considered heretofore, and Professor Van Vleck applied the solution of a certain type of difference equations to that of a type of differential equations.

The exercises of the department of physics were totally devoid of ostentation, and were intended, like the rest, to emphasize the idea of research. It was fortunately possible to present the spectacle of the conjunction of two stars of the first magnitude in Prof. Albert Abraham Michelson of Chicago and Prof. Ernest Rutherford of Manchester, England, Nobel prize-winners of the last two years. Professor Michelson's lecture gave a description of his new engine for ruling diffraction gratings for the study of spectra, which surpasses even the wonderful accuracy attained by the late Professor Rowland. The results of his researches on the apparent fixity of the luminiferous ether with respect to the earth have baffled physicists for the past twenty years, and it was accordingly particularly gratifying that Prof. Vito Volterra of Rome, one of the greatest of living mathematical physicists, should have chosen for the subject of his first lecture "The Theory of Electric and Luminous Waves," giving a clear exposition of the Principle of Relativity, that daring assault on the notions of time and space which is now setting physicists by the ears and leading to critical reëxamination of Newtonian mechanics. Without its aid Professor Michelson's result has hitherto proved inexplicable. The Principle of Relativity, in a word, states that the *time* of an event can be known only when it is known *where* it takes place, and that the *where* can be known only when the *time* is known, time and space being interrelated by the velocity of light in the ether. In his lectures on Elasticity, Volterra gave new and beautiful results, while his last lecture on the mechanics of "heredity," or the influence of past phenomena on the fu-

ture, communicated a new creation in this mathematical field which has long been the despair of the physicists. The method devised by Volterra leads to a new department of mathematical analysis, the subject of "integro-differential equations," the history of the past being mathematically expressed by integrals whose effect on the present is expressed by differential equations. The recipients of academic honors in their responses were particularly kind in their recognition of the efforts made at Clark to bind together the two sciences of mathematics and physics, and to mitigate what Prof. G. A. Miller has lately called "our lamentable and disgraceful lack of mathematical physicists."

One of the most attractive of the eminent foreign savants who came to this country expressly to attend the celebration was Sigmund Freud of Vienna. Far too little is known in America of either the man or his work. For twenty years he has been publishing memoirs, and even volumes, based upon his vast clinical experience with cases of hysteria and allied phenomena. A pupil of Charcot and Westphal, he has developed what may now almost be called a new system of psychology, which seems to a growing number of workers in this field, of whom the writer is one, to be the best word yet spoken there. His views are now beginning to be talked of in Germany as the psychology of the future, as Wagner's music was once dubbed the music of the future. And yet, partly because so much that he taught was new and revolutionary, he has until lately had but scant recognition; and because he attempts to do justice to sex in his scheme, he was for years socially ostracized. Happily, however, he is now coming to his own and a growing circle of very vigorous young men in all civilized countries are giving him due recognition and working out his ideas. It is difficult to give, in brief and lucid phrase, any adequate conception of a system that has so many details and even technicalities. It seems certainly to go distinctly beyond Janet; and if it be confirmed, it plays havoc with many of the systems of both philosophical and of laboratory psychology. Some general idea of what it means might be suggested as follows: Dr. Freud does not accept consciousness as the oracle of the soul in any such sense as does modern psychology of the type, *e g.*, of Wundt or James. More likely, he would say, consciousness never says what it means, but must always be interpreted. It is rather essentially superficial and misleading. It is a compromise between the real nature of the soul and its environment, which is at so many points repressive. Dreams, for instance, are the springing up into consciousness of various undeveloped or repressed remnants of the daily activity; and if the missing links can be supplied, they are not only rational but of the highest interpretative value. Wit is another key to the activity of the submerged self; so are automatic actions, unintended errors of speech, inflection, etc. Freud is the father of the psychoanalysis, one aspect of which has been popularized in this country by Münsterberg in the Harry Orchard case. He is also the father of something very like the hypnoidization of Sidis, which, instead of hypnotizing the patient, asks him merely to sit in absolute quiet and mention whatever thoughts occur to him, which, no matter how apparently irrelevant, are always shown by a little interpretation to be very much in point. Strangely enough, Freud had scarcely heard of the Emmanuel Movement in this country; but having listened to all that he could learn about it, he expressed the emphatic opinion that it was utterly unscientific and that work with psychic functions was far too complex and intricate to be trusted to non-experts. It was remarked at Clark several times by his chief European pupil, Professor Jung of Zurich, who was with him, that the invitation to America, the honorary degree bestowed upon him, and especially the sympathetic attitude of those who heard him, came at the psychological moment for him personally as well as for his views.

In the department of education and school hygiene the noteworthy feature was the emphasis placed upon school hygiene and mental hygiene. The former subject was represented by Dr. Leo Burgerstein of the University of Vienna, co-author of Burgerstein and Netolitzky's "Handbuch der Schulhygiene," the world's leading authority or the subject; mental hygiene was treated by Dr. C. G. Jung, specialist in psychiatry in the University of Zürich. The most interesting lecture of Dr. Burgerstein was, perhaps, that on co-education and hygiene, in which he discussed the subject in the light of modern scientific studies of the physical differences between boys and girls. He emphasized the need of differentiating secondary education for boys and girls where they are taught together, and expressed the belief that co-education is gaining ground in central European countries. Dr. Jung explained and illustrated his well-known *diagnostische Assoziationsmethode*. The significance of these lectures lies not so much in the practical application of this method in the detection of crime, as exploited by Professor Münsterberg, nor alone in the applications in diagnosis of mental diseases; but, rather, in the fact that the investigations by Dr. Jung represent pioneer work which promises to throw light on the underlying principles of a sound and scientific doctrine of mental hygiene.

Other lectures were given by distinguished scholars of this country and Europe. Some of these, though they cannot be summarized here, were of the first importance in their respective subjects. Honorary degrees were conferred upon twenty-one recipients.

A Treatise on Zoölogy. Edited by Sir E. Ray Lankester. Part I: Introduction and Protozoa. By Prof. S. J. Hickson, F. W. Gamble, A. Willey, J. J. Lister, H. M. Woodcock, and the late Professor Weldon. New York: The Macmillan Co. $5.25 net.

The developments in our knowledge of the unicellular microscopic animals during the last decade, especially in the domain of preventive medicine, make any addition to the literature of the subject timely and valuable. Not only because of their importance in modern pathology and of their relations to many infectious diseases, but also because of their general scientific interest, the Protozoa demand attention from all who follow biological pursuits. Standing as they do, on the border line of animals and plants, and leading from the simplest of living things through thousands of grades of increasing complexity, to the higher animals, or Metazoa, they offer to the investigator a wealth of material for the study of living processes which in higher animals are hidden under a cloak of complex organs and intricate activities.

The present volume, written by several men eminent in the field of English biology, does not prejudice the reader in favor of any special line of protozoan investigation, but aims, rather, to give a general outline of the entire group from a zoölogical point of view. As a basis, therefore, for more specialized work in different lines of protozoan research, the book has a greater value than any of the others of more limited scope that have appeared in the last few years.

Unfortunately, as with all such collaborated works, the various groups of Protozoa are not equally well presented, and the treatment of some of the topics indicates plainly that the authors are writing from a library rather than a laboratory knowledge of the subject. This may be one reason why the work contains few references later than 1906. Furthermore, the genus Spirochæta, which, since 1905, when Schaudinn discovered the minute organism in syphilitic victims, has been a fruitful object of research in every civilized country, is not named in the body of the book but appears in a short paragraph in an appendix.

The introduction by the editor is little more than a re-wording of the same author's ideas published in the eighties in the "Encyclopædia Britannica," although he proposes one or two new terms, such as "periplasm" (instead of

cytoplasm) and "conio-karyote" (powder nucleated), which, we venture to predict, will not be used again. The sections on Proteomyxa, by S. J. Hickson; Mycetozoa, by J. J. Lister, and Hæmoflagellates, by H. M. Woodcock, are extremely valuable; the last, however, differs little from an earlier publication by the same writer in the *Quarterly Journal of Microscopical Science*, 1906.

Although there are few original figures, the book is well illustrated and, taken altogether, forms a most acceptable companion to the volumes of the Treatise which have already appeared.

Alan E. Munby's "Introduction to the Chemistry and Physics of Building Materials" (D. Van Nostrand Co.) is an unusual book in scope and treatment. Its purpose is to explain the scientific principles involved in the use of building materials in such a way as to be comprehensible to one who has no previous knowledge of physics or chemistry. Probably this is an impossible undertaking. It is hardly likely that a man who had never seen a chemical symbol before he opened the book would be able by the time he had reached p. 203 to understand the difference between Le Chatelier's crystalloid theory and Michaelis's colloid theory of the setting of Portland cement. But if he fails it is not the fault of the author, who does his best to make things plain and to define scientific terms as he goes along. It is, indeed, rather surprising to see how much of the fundamental sciences of physics, chemistry, mineralogy, and geology can be brought into the hundred pages which constitute the first part of the book. Part II is devoted to the consideration of the varieties, composition, properties, and tests of building stone, cements, metals, timber, and paint. The book will not be so useful to the uneducated or self-educated builder and mechanic as to one who has had a smattering of school science but is not able to apply it to his work. The use of British names for stone and other building materials impairs the value of the book for the American public. The author ventures one novelty in nomenclature, the introduction of the word "ferra" for ferric oxide, to correspond with alumina. The term would certainly come handy in the discussion of rock formulas.

From the middle of the sixteenth century, when Mercator employed the hyperbolic functions in producing the famous Mercator map, down to the present time, the use of these functions has steadily increased with the growth of natural science. To-day they find application not only in every branch of pure physics, but also in applied physics, as in the decay of light or electricity, or in expressing measurable mechanical strains like geological deformations. Accordingly, a wide variety of science students will welcome Messrs. Peirce and Van Orstrand's "Hyperbolic Functions" (Smithsonian Institution), which consists of seven tables of values of these and closely related functions.

Dr. William Christopher Krauss died in New York city September 21, in his forty-sixth year. He was a graduate of Cornell University, of the Bellevue Hospital Medical College, and of the University of Berlin; had served as president of the American Microscopical Society and other learned societies, and was a recognized authority on nervous diseases. Dr. Krauss was the author of a "Textbook of Insanity" and of many articles published in scientific journals. He was associate editor of the Buffalo *Medical Journal* and of the Berlin *Neurologisches Centralblatt*.

From Spruce Creek, Newfoundland, comes news of the death, September 20, of Dr. Leonard Pearson, dean of the Veterinary School of the University of Pennsylvania since 1897. He was born at Evansville, Ind., in 1868, and was graduated from the Agricultural School of Cornell University, and afterwards from the veterinary department of the University of Pennsylvania. Dr. Pearson also studied in Berlin and Dresden and in the laboratory of Dr. Koch. In 1891 he became assistant professor of the theory and practice of veterinary medicine at the University of Pennsylvania. He has served as president of the American Veterinary Association and other organizations. In 1895 he became State veterinarian of Pennsylvania. He contributed many papers on the veterinary sciences and on zoötechnics to the journals, to Johnson's "Encyclopædia," and to the *Veterinary Magazine*, of which he was the editor.

William Thayer Smith, M.D., dean of the Dartmouth Medical School, died at Hanover, N. H., on September 17, at the age of seventy-one years. He was the son of the Rev. Asa Dodge Smith, a former president of Dartmouth College, and was born in New York on March 30, 1839. In 1878 he was graduated from the Dartmouth Medical School, in which he was to become a professor of physiology in 1885, and dean in 1896. Dr. Smith was the author of "Elementary Physiology and Hygiene" and "Primer of Physiology."

Drama and Music.

Was Shakspere a Gentleman? By Samuel A. Tannenbaum. New York: The Tenny Press.

Mr. Tannenbaum sets himself to show that of two applications by John Shakespeare to the Heralds' College in 1596 and in 1599, the first application only was granted. The particular point of attack is this passage of Sidney Lee's:

> His father's application now [1599] took a new form. No grant of arms was asked for. It was asserted without qualification that the coat had been assigned to John Shakespeare, while he was bailiff, and the heralds were merely invited to give him a "recognition" or "exemplification" of it. An exemplification was invariably secured more easily than a new grant of arms. The heralds might, if they chose, tacitly accept without examination, the applicant's statement that his family had borne arms long ago, and they thereby regarded themselves as relieved of the obligation of close inquiry into his present status. The college officers were characteristically complacent.

Answering Mr. Lee's objection that the direct granting of arms in the 1599 transactions proves they could not have been allowed in 1596, Mr. Tannenbaum insists that the request in 1599 was merely to be allowed to impale the Arden arms with those of the Shakespeares, and that it was a frequent abuse with the heralds to "assign, grant and confirm" an old patent each time that its holder applied for an additional distinction, thus forcing payment anew of the original fee. Whatever be the force of this, Mr. Tannenbaum is certainly on dangerous ground when he urges that if John Shakespeare in a deed of 1597 was still described as "yoman," it was because in three months his new honors would not have become generally known and because, as the deed was in Latin, he would not have noted the error himself. This is dangerously near *évidence pour rire*.

In eight pieces of evidence, positive and negative, Mr. Tannenbaum finds support for his two contentions. From the absence of any impaling of the Arden with the Shakespeare arms by any member of the Shakespeare family, though their arms are found quartered with those of persons who intermarried with them, he concludes that the 1599 request was not approved by the College. His point that a member of the College, circa 1601, accused Dethick and Camden of having granted arms improperly in numerous instances, John Shakespeare's being one, merely proves that arms were granted, but clears not at all the choice between 1596 and 1599. His next point, that in their reply Camden and Dethick sketch in the Shakespeare arms only, and in no way speak of the Arden arms, perhaps strengthens Mr. Tannenbaum's contention that it was the 1596 request which was granted. He refers to Harleian MS. 6140 at folio 45, and to the sixth edition of Guillim's "Display of Heraldry" (1724,) as showing a tricking or description of the Shakespeare arms with, in each case, the statement that they were granted by Dethick. This to Mr. Tannenbaum means 1596, for by 1599 Camden was also Garter; but he is forced to admit that no one has been able to find the exact source of these two statements. Of course, too, the second may rest on the first, and both may be only the popular tradition as to Shakespeare, which in many cases must be discounted. His best arguments are his fifth and sixth: the present Richmond Herald wrote him in 1908 that the "Index College of Arms," "a book," to quote this herald, "in which the Officers of Arms make notes of any Coats of Arms they are interested in," contains a description of the Shakespeare arms and states that they were "granted 20 October, 1596, to John Shakspere, of Stratford-on-Avon, in Com. Warr., Gent., per Will. Dethick." This entry, it is known, was made in the first half of the eighteenth

century. The Richmond Herald also wrote:

The [Shakespeare] arms appear again in the assignment for Arden in 1599, clearly proving, if proof were necessary, that the 1596 patent did pass, otherwise they would not have been inserted in the Patent. The issuing of the Patent has never been questioned here.

Finally, Mr. Tannenbaum urges that after 1597 Shakespeare is described as "Gent" and "Master" in numerous documents and in the published writings of contemporaries, and that this would, in the light of existing regulations of the College, have been impossible if not authorized. He thinks Mr. Lee's contention that complacency granted in 1599 what had not been granted in 1596 is negatived by the fact that Dethick would not have dared to be thus complacent, since in June, 1597, he had been declared culpable in granting an unwarranted exemplification to one Rotheram.

That arms were granted all this evidence shows; but the one strong bit of evidence in favor of 1596 over 1599 is the unequivocal statement of the present Richmond Herald that the appearance of the Shakespeare arms in the assignment for Arden in 1599 means they must have been first granted in 1596. The rest of the evidence is either repetition of a tradition which is not traced, in its source, earlier than the first half of the eighteenth century, or a question of probabilities. The little book forms an effective attack on Mr. Lee's position by the doubt it raises, not by the conclusion it proves true.

The Philharmonic Society will give this season thirty-three concerts in Carnegie Hall, or more than twice the customary number. These concerts, all of which will be directed by Gustav Mahler, have been divided into four series and a Christmas Day concert, as follows:

First series—Eight Thursday evenings at 8:15: November 4 and 25, December 16, 1909; January 6 and 20, February 3 and 17, March 10, 1910. Eight Friday afternoons at 2:30: November 5 and 26, December 17, 1909; January 7 and 21, February 4 and 18, March 11, 1910. This series corresponds with the regular series given by the society in former seasons, the Thursday evenings being substituted for the Saturday evening of previous years.

Second series—Historical cycle. Six Wednesday evenings at 8:15: November 10, December 8, December 29, 1909; January 26, March 2, March 30, 1910.

Third series—Beethoven cycle. Five Friday afternoons at 2:30: November 19, December 31, 1909; January 14, March 4, April 1, 1910.

Fourth series—Five Sunday afternoons at 2:30: November 21, December 12, 1909; January 16, February 13, March 6, 1910, and a Christmas Day concert, December 25, at 3 P. M.

The Kneisel Quartet's sixteenth New York season will begin on November 23, at Mendelssohn Hall. Other concerts will be given on December 14, January 4, January 25, February 15, and March 8. Matinées will be given in the same place on March 15 and April 5. Composers on the programmes will include Beethoven, Carl von Dittersdorf, Haydn, Mozart, Cherubini, Schubert, Schumann, Robert Volkmann, Brahms, Mendelssohn, César Franck, Tchaikovsky, Dvorák, Saint-Saëns, and Giovanni Sgambati.

Will L. Thompson, music publisher and writer of many sacred songs, died on September 20 in New York city. He was born in Beaver County, Pa., in 1847, and received his musical education in the Boston Music School, the Boston Conservatory of Music, and the Leipzig Conservatory.

John Lassalle, well known as a baritone singer in opera, died in Paris on September 7. Born in Lyons in 1847, his studies at Paris in painting and music were followed by his début at Liège in 1869. His career at the Paris Opéra extended over twenty-three years, and he made frequent appearances at Covent Garden as well. In 1903 he was appointed professor of singing at the Paris Conservatoire.

Sally Liebling, a distinguished German pianist, a pupil of Liszt and, in 1888, founder of the new Berlin Conservatory, died in that city September 16. He was born at Posen, Germany, in 1859. In 1875 he visited the United States, playing with Thomas's Orchestra, and he has since then made many concert tours in America and on the European Continent.

Art.

MR. M'KIM AND AMERICAN ARCHITECTURE.

The first feeling of friends of the late Charles F. McKim must be one of deep personal loss. The human attractiveness of this architect was so great as to make men almost forget his professional accomplishments. "Charles the Charmer" Saint-Gaudens called him in a public speech. But here we can speak of him only as the senior member of the firm which, for the last generation, has been more influential than any other in reflecting and determining the taste of this country in their art.

True, Mr. McKim might have fulfilled this description without being an artist at all. He might have been simply the "business man" of a fashionable firm, which "kept" artists, as the proprietor of a famous blacking factory was alleged to have "kept a poet." After his studies in Paris, Mr. McKim returned to America, on his defence. He was made to feel that he must justify his training by adapting its results to the conditions of his native land. Hunt and Richardson underwent that experience, and it did them both good. The architectural "culture" of the period in America was committed to the Gothic revival, in which one might have expected this neophyte to join. His first essays were, in fact, in that direction, the most noteworthy of them being, perhaps, the seashore cottage in New Jersey where Garfield was sent in the desperate hope "that he might heal him of his grievous wound." These early experiments were in the fashion of the time. They tended to bear out, as to their author, the belief that Stevenson expressed about Mr. Howells: "A man, as I read him, of an originally strong romantic bent"; in the eyes of the romanticists, they gave to his subsequent conversion to classicism the color of apostasy. It is, at any rate, certain that, in his maturity, with the exception of a church in Morristown, N. J., which is a careful and sensitive compilation in late English Gothic, Mr. McKim abjured romance.

It would be hard to say how far Mr. McKim's partners may have influenced him. The admirable fraternity and loyalty of the members of the firm were for the most part sufficient to prevent wrong attributions. One could be at no loss, among their earliest works, to assign the "Bank of Banks" at Fifth Avenue and Forty-second Street, and the Tiffany house at Madison Avenue and Seventy-second, to Stanford White; while one would be inclined to declare that the Roman palace lower down in Madison Avenue, and of nearly the same date, was by McKim "lined" with White—to ascribe the exteriors to the senior and interiors to the junior partner. But the Agricultural Building at the Chicago Fair was the individual work of Mr. McKim; and that re-study of the Baths of Caracalla was the most classical in spirit of all the works at the fair which were not mere reproductions. From a Roman motive it derived an Hellenic result, insomuch that at the time Swinburne's praise of Landor was plausibly transferred to it:

> And, through the trumpet of a child of Rome,
> Rang the pure music of the flutes of Greece.

Fully as individual is the general plan of the new buildings of Columbia University, and the library in which that general conception has been carried out in its own grandiose and monumental sense. Mr. McKim was one of the three architects invited by the trustees, upon their purchase of the site on Morningside Heights, to prepare a general plan for its development, and to the study of the problems which this involved he devoted nearly two years, looking not only to the immediate needs and resources of the university, but to the far future, and laying foundations upon which others might build. While he was most ably assisted by his associates, Mr. White designing Schermerhorn Hall and Mr. Mead the Engineering Building, the general plan was Mr. McKim's own in a literal sense, and no one feature of it more so than the South Court, to which he attached special value, not only on account of its architectural importance, but as expressing the open door of the whole university. Quite in the same class is the fragment which alone is thus far visible of the large design for the

Brooklyn Institute. Of more questionable success is the University Club. In spite of Congressional carping, one may be permitted to cite the restoration of the White House in Washington as the carrying out of the original designer's conception on a scale and with a sumptuosity of which he would not have ventured to dream. More important was McKim's restoration and extension of L'Enfant's original plan of Washington. It had become so overlaid with defacements that the first duty of the commission, of which McKim was the leading spirit, was to clear them away and enable the design to assert itself. But the work included extensions, to meet later needs, and these were made with perfect sympathy and true artistic intelligence.

The chief monument of Mr. McKim's powers will probably remain the Boston Public Library. This has been dismissed by high critical authority as a "copy" from the Library of Ste. Geneviève in Paris. Ste. Geneviève is soon said. But to say no more is discreditably to ignore the great and sensitive care that has been taken in the adjustment and extension and modification of the prototype. In fact, few modern buildings so forcibly evince that they have been affectionately "lived with" by their designers, from the first conception to the last detail, insomuch that the very sidewalk "belongs." The Boston Public Library is a rare success, and of itself would justify all the honors that have been bestowed, at home and abroad, upon its author.

Mr. McKim's career fell in an epoch fruitful for American architecture. Monumental buildings, for public or business use, were, in his lifetime, rising in greater numbers than ever before, while increasing wealth and a more chastened taste were giving architects tempting opportunities in the erection of private houses, both in city and country. Indeed, it is the envious testimony of foreigners that America is to-day a kind of promised land for architecture. To have contributed so much to the wise guidance of this artistic movement is one of the just titles of Charles McKim to remembrance. John Delane of the London *Times* once wrote that he thought of setting up as an architect, since he had the first requisite to success—namely, entire ignorance of the business. It would be a libel to say that anything like this was true of American architects at the time Mr. McKim began to work; but there has certainly been enormous progress since that day, and his example and counsels have not been the least of the powers at work.

"Dutch Bulbs and Gardens" (The Macmillan Co.) is another of the books illustrated in color, which prove the ability of modern water-color artists. Miss Mina Nixon's pictures, as here represented, are excellent—better, as affording backgrounds and landscape values, than the glaring color-patches which too many painters of Dutch flower-fields are fond of giving us. Besides such subjects, her glimpses of the palace gardens at Het Loo are charming. As for the text, in such books it is quite a matter of course that it should not closely correspond with the pictures, and it should, perhaps, not be taken too seriously. But one wishes that Miss Silberrad's chapters spoke more of Dutch gardens, which may be assumed to be, in spite of Dutch thrift, for pleasure rather than profit, and to show some national characteristics of design and taste. The author's English is careless; she is, further, a little given to quotations concerning old-time fashion in bulbs, so that she teases us by hovering on the fringe of the subject of bulb-growing. The appendices (which may be assumed to be by Miss Sophie Lyall, whose name is on the title page; her connection with the book is otherwise not clear) are odd combinations of translation and critique, both concerning bulb-growing 140 years ago. What changes time has made in the custom and the science we are not told. But, apart from these disappointments, the text will be of interest to American gardeners, since it shows the origin of the bulbs which we buy in such quantities. The book gives the reader a welcome view of a community that has been pursuing its work for generations, and of individuals whose quiet devotion is yearly increasing the world's minor beauties. We must, after reading, acknowledge our debt to the Dutch.

It is a rather wan philosophy that Vernon Lee (Miss Violet Paget) unfolds in her "Laurus Nobilis" (John Lane Co.). As A. C. Benson makes a too conscious cult of sweet reasonableness, so Miss Paget makes one of serenity. But this serenity is hardly spontaneous; it has been valiantly fought for, and the dust and heat of that strife are still too apparent. Having achieved a permanent attitude, however, Miss Paget is determined to make the universe square with it. She sets out to prove that the development of the æsthetic faculties will foster the growth of the altruistic instincts, bring men into harmony with the universe, and aid the nobler self-realization of the individual. These are assertions that no one would willingly deny. But Miss Paget's instructive air serves only to throw into relief her unconsciousness of the nature of any satisfying demonstration. Thus to say that a whole school of modern artists is at sixes and sevens with the universe may be a convenient fashion of speaking. In a philosophical essay it lays itself open to the retort that these artists are themselves but parts of an indivisible universe which cannot, rationally, be at sixes and sevens with itself. As the expression of a temperament her book is hardly more persuasive. From her æsthetic world the keen winds and arduous waters would be banished, in it light and flame would die, and under the last rays of a perpetual sunset we should wander in the attitude of the saints and martyrs of early Tuscan art. Nor is the style of these essays less wan than their thought. The author hovers hopelessly about a verbal felicity or a happy rhythm, and never actually attains either. The book is the fruit of a spirit that lacks neither charm nor distinction, but always the ardor to embody these qualities in a form of quite authentic memorableness.

THE TURN IN THE MONEY MARKETS.

During several months, it has been a matter of frequent comment and warning that it was no longer safe to ignore the probable influence of a rise in the autumn money markets. Last year, the month of September opened with the demand for money to use in ordinary trade at very low ebb; the New York surplus bank reserve stood at $65,000,000, almost the highest recorded level. Money rates, therefore, continued low; demand loans on the Stock Exchange ruled at 2 per cent. for a good part of the autumn, and went no higher than 4½ per cent. at any time; European money rates were similarly low and Europe a ready lender in New York, and the money market presented no obstacle to Stock Exchange speculation for the rise with borrowed money. The present month of September opened with the New York surplus bank reserve down to $18,000,000, hardly above the average for the time of year. Trade activity, notably in this country, had increased rapidly as compared with a year ago; European banks, already heavy lenders, began to look askance at the New York market, and a speculation of unusual violence was under way in Wall Street.

Two visible weather-signs have given evidence of a changed condition. A week ago, call money at New York, for the first time in five months, rose to 3 per cent., and loans on time advanced 1 per cent. over the prevalent rate of September's opening. This week, the Imperial Bank of Germany, whose action on its official discount rate is often the harbinger of European money conditions generally, put up the rate from 3½ to 4 per cent., and the cables informed us that the action was expressly designed to check the excessive stock speculation of the day. But the really impressive incident was the change in the New York surplus bank reserve.

At the close of July, when the New York Associated Banks reported a surplus of $34,259,000 over the 25 per cent. reserve required against deposits, it was possible to say that so large a figure had been reached at that date in only two years of the decade past—1908 and 1904; furthermore, that the surplus was more than twice as large as in such years as 1907, 1906, 1905, or 1902. The weekly bank report of Saturday, September 11, showed conditions so greatly changed that the surplus, $3,166,000, was smaller than that of the corresponding date in any but two of the fifteen past

years. Those two exceptions, 1902 and 1899, were years of excessively disordered autumn money markets; both witnessed deficits in the bank reserve, and Wall Street call money rates rose to 35 per cent. in the one season and to 186 in the other.

This change within six weeks in the bank position came as a consequence of decreased cash reserves. Since the end of July, cash holdings of the New York banks had diminished $43,000,000. Such decrease is a normal incident of the season; it is expected at the ending of an August and the opening of a September. There are always heard in the midsummer months, both from Wall Street and from the farming West, cheerful assurances that the West is now so rich in independent wealth that this time it will not have to call on the Eastern markets to "help move the crops." But what the authors of these assurances forget is that this money of its own which the West proposed to use was deposited in New York and had been rented out, for a modest consideration, for New York banks to lend on Wall Street during the dull months of the agricultural year. When the Western banks needed their money back again, they quite naturally drew on the same deposits.

Now a loss of cash reserves on such a scale necessitates, in an ordinary year, curtailment of loans—especially of loans to Stock Exchange speculators—to square with the reduced resources. No such curtailment has occurred this season; as a result, the banks were brought, two weeks ago, face to face with the possibility of an exhausted surplus.

Under such circumstances, there remained four possible courses of procedure. Stock Exchange speculation, the greatest absorbent of the surplus bank funds in this city, might be resolutely curbed, and liquidation of loans attained through that expedient. Inland banks with credit deposits in New York institutions might be induced to withdraw those deposits, thus decreasing the liabilities of the New York banks, and to lend the same deposits out directly, for their own account, to the same borrowers as before. European credit might be drawn upon, whereby loans now standing on the books of New York banks might be virtually transferred to the books of foreign lenders, the borrowers again not being disturbed. Or, finally, the position might be taken that the borrower has a right to the money, and that, deficit or no deficit, he will go on borrowing.

All of these four expedients have at times been used. In 1902 particularly, the banks themselves took a hand in putting a stop, through calling in their Stock Exchange loans, to the reckless speculations of the so-called "Gates pool." In most of our recent autumn speculations, the inland banks have turned a good part of their New York deposits into loans. In both 1905 and 1906, "shifting of loans to Europe" was employed on an extensive scale. And in 1905, the time unquestionably came when banks reported a weekly deficit in reserves with no apparent effort to adjust things.

One of these expedients has already been applied. When call money went to 3 per cent. in Wall Street last week, the inland banks loaned out their New York funds for their own account, thus relieving the loan and deposit account of the New York Associated Banks. The bank statement of the ensuing Saturday, September 18, showed the extraordinary reduction, in the New York bank loans, of $30,600,000; as a result of which, the surplus reserve increased $8,900,000. This did not arrest either the harvest outflow of currency or the firmness of money rates. In fact, it was recalled that when, under very similar circumstances and at exactly this time of year in 1905, a similar "shifting process" cut down loans $30,000,000 in one week, $20,000,000 in the next, and $9,000,000 in the next, nevertheless continuance of the heavy demand from stock exchange speculators so far offset this artificial relief as to create a deficit in bank reserves in November and drive call money, at the end of the year, to 125 per cent.

Is such a result at all probable this season? It is difficult to say. The trade demand for money, here and abroad, is very much greater than it was a year ago, but probably very much less than in 1905. That is in favor of the present bank position and of the Stock Exchange speculation. Other considerations are not so clearly to our advantage. Europe's markets are not the recourse which on some previous similar occasions they have been. Wall Street does not enjoy the unbounded credit which was offered to it by the great European banks in 1906; the country has no such accumulated foreign credit fund on trade account as it possessed at this time in 1901 and 1904. Europe, like ourselves, has passed through 1907, and the balance on merchandise trade account stands far more heavily against us now than at any time in a dozen years.

There is always left the expedient of gold imports, to replenish our bank reserves. But gold imports come in response to such a fall in foreign exchange as is commonly brought about, either through a very large excess of merchandise exportations, or through a very sharp rise in money at New York. The first we cannot hope to have. The second may come to pass; but it will hardly arrive with the aid and comfort of the powerful borrowers for Stock Exchange speculation. Tight money brings in foreign gold; but it also, and for obvious reasons, has an awkward way of knocking down the price of stocks.

The Safest Way To Earn 6%

Investors — small or large—should inform themselves on Irrigation Bonds.

These bonds are secured by liens on the most fertile farm lands in America. The value of the security is in many instances four times the loan. The first year's crop often sells for more than the loan—some imes by several times over.

Some of these bonds are municipal obligations, like School Bonds. They form a tax lien on the real property within the district.

They are serial bonds, so one may make short-time or long-time investments. Each year, as part of the bonds are paid, the security back of the rest is increased.

The bonds pay six per cent.—a higher rate than one can obtain on any other large class of bonds equally well secured.

The bonds are for $100, $500 and $1,000, so one may invest either little or much.

These are ideal bonds, and they have become the most popular bonds that we handle.

We are the largest dealers in Reclamation Bonds. In the past 15 years we have sold 70 separate issues, without a dollar of loss to any investor.

Now we have written a book based on all this experience, and the book is free. Please send this coupon to-day for it, for you owe to yourself a knowledge of the facts.

Hellas and Hesperia
or
The Vitality of Greek Studies in America

By BASIL L. GILDERSLEEVE, Francis White Professor of Greek in Johns Hopkins University. With portrait. $1.00 net; by mail $1.10.

"Demonstrates the living power of the Greek language and of Greek ideas over American life. Delightfully unconventional in form. It is a delight to read what a man has to say who has wholly digested and assimilated the learning he has acquired."—*N. Y. Sun.*

Henry Holt and Company 34 W. 33 St. New York

Elementary Chemistry

By HOLLIS GODFREY, Head of the Department of Science, Girls' High School of Practical Arts, Boston, Mass. Crown 8vo. With numerous illustrations. pp. xiv+456, $1.10.

Four ideals have governed the writing of this book. The author has desired to obtain simplicity; to reach the understanding of the student; to rouse the pupil to a realization that the science of daily life is identical with the science of the schoolroom; to include all the essential facts and theories which could be rightly assimilated in one year's work in elementary chemistry.

The Nation.

NEW YORK, THURSDAY, SEPTEMBER 30, 1909.

The Week.

The selection of Mr. Lee McClung, the treasurer of Yale University, as Treasurer of the United States, is gratifying proof that the President desires to put into offices connected with the Treasury men free from political entanglements, who can be counted on to give efficient and able administration. Like the appointment of Professor Andrew of Harvard as Director of the Mint, the choice of Mr. McClung will come as another blow to the organization Republicans who, it must be admitted, have been singularly unsuccessful since Mr. Taft took office in landing jobs for any of the old broken-down hacks who usually are hailed as great financiers or administrators. Mr. MacVeagh, too, is fully awake to the importance of the new type of official, and is surrounding himself with a group of active and successful young men who may be counted upon to help him in his proposed modernization of the Treasury's methods. As to Mr. McClung, his excellent work, at a personal sacrifice, in remodelling the accounting system at Yale, argues him capable of making a success in his new office.

The late Governor Johnson expressed his general political and democratic faith in an article in the October *World's Work*. Breathing throughout it is a warm, imaginative belief in the future and in man himself. And the simplicity and genuineness of Gov. Johnson's feeling remove all taint of demagoguery. Commenting on the article, the *World's Work* defines what makes a Western man Western: "It is the feeling that the West puts a higher value on a man and less value on a dollar than the East—that a man counts for what he is, rather than for what he is worth, that the door of opportunity swings open more easily and more widely. This is what he means by 'more room,' 'more freedom,' 'a larger view,' and all the other breezy generalizations that make up his vocabulary." This Western feeling is understood, the editor goes on to say, by Senator Cummins, Gov. Johnson, and ex-President Roosevelt, and it is a feeling that may be an important political factor next year and two years thereafter. We should say, however, that the phrases used imply no conspicuously different political or social philosophy from that held in the East. There is merely in the West a more unquestioning confidence about the possibilities of what may be; consequently a greater sympathy with all tendencies which point to the future.

New Jersey's political conscience must be tough, indeed, if it fails to stir to shame under Governor Fort's hot indignation. Seldom has a party come in for such scorching denunciation as the Governor poured out at Newark upon the leaders of the Republican party in the State beloved of corporations. It is not easy, said Governor Fort, to use hard words against your party. He might have added that it is still more difficult for a public official to stand up before the voters and admit that he has failed in what he tried to do. That was the most manly thing in the Governor's speech. Elected upon a platform that bound the party to a thorough programme of political and legal reform, New Jersey's Governor declares that, with the exception of two half-hearted reform measures, neither he nor the honest minority in the Legislature has been able to carry out any of the party pledges. The bosses have put their foot through promises and pledges, and, seated in the legislative chamber, have openly dictated legislation after the good old plan that he shall sell who has the power, and he shall buy who can. One thing only honest people across the river can be thankful for: the constitutional provision which makes Governors ineligible for reëlection enables New Jersey to hear a few words of bitter truth every two years from the lips of a man who knows.

We could have wished that it had been a man named Smith, or Jones, not Khyat, who had determined to bring suit to determine whether there is any limit to the personal outrages which may be inflicted by custom-house inspectors. Yet if no native-born American has spunk enough to find out his rights and to insist upon them, we are glad that an adopted citizen has come to the rescue. Certainly, the indignities to which Mr. Khyat's wife and children were subjected on the pier, sound almost incredible. Merely on suspicion that they were smuggling, they were literally stripped to the skin, and given such a nervous shock as to make them seriously ill. And it does not appear that they even got an apology from the officials, when nothing dutiable was found! If these things had happened to an American at the hands of Turkish customs officials in Beirut, we should have known what to think of the mingled stupidity and insult.

Interesting confirmation of our belief that the United States could have as efficient an army as it now has for 60 per cent. of what it pays for its troops, comes from a military source. Capt. George T. Langhorne of the Eleventh Cavalry, in the course of a paper in the *Journal of the Military Service Institution* on his military observations when abroad last year, records his amazement at the comparatively slight cost of foreign armies as contrasted with our own. "It is safe to say," he writes, "that for the same appropriations we could have double the number of men with better efficiency; but to do so, we should have to follow the best business methods and have the interest of the nation above all other considerations." Cost of administration in European armies, Capt. Langhorne finds, has been reduced to as low a percentage as in any of our immense business plants. There is little or no waste, and such money as is expended is applied directly to practical necessities, great attention being given to unit costs of men, horses, arms, etc. Here is a fresh demonstration of the need for the board we have urged, which should recast the business system of the army. Plenty of efficient men of affairs could be called upon for volunteer service, and there are available a number of younger officers like Capt. Langhorne who realize that the American taxpayer is getting only about sixty cents' worth of army for every dollar he devotes to that purpose.

The Hudson-Fulton display of Saturday night in New York makes one look back with pitying contempt upon the notion of "illumination" which prevailed before the introduction of electric lighting. Beginning only with Paris in 1889, followed by the outlining in light of the Court of Honor in Chicago in 1893, with swinging searchlights and the iridescences of the "Electric Fountain," then again the view across from the Trocadero to the Champ de Mars in 1900, and the Pan-American at Buffalo in 1901, what a wonderful series it has been! In some respects the latest mentioned was the most remarkable, the gradual illumination of Buffalo until the Electric Tower, in a white and dazzling sheen, closed the vista of the display. Such an advance might have been expected from a fair which had harnessed Niagara for power to be transformed into light. But even those who had seen all these sights must have found the spectacle of Saturday night not only worth see- but worth going to see. And some of the most memorable of the sights were far from the Riverside Drive. Those who were fortunate enough to go home by the East River found its illuminations as memorable as on the Hudson. The outlining of the four great bridges with electric light produced an effect which surely cannot be matched in any other city of the world.

If a statue of Hudson is to constitute part of his projected monument, there can be no possible excuse for failing to "get a likeness." What manner of man Hudson was is fully set forth in "Knickerbocker's History of New York." To begin with, he was "a short, square, brawny old gentleman, with a double chin, a mastiff mouth, and a broad copper nose." Bronze would then seem to be the best material for his statue. But Knickerbocker gives us even fuller details:

> He wore a true Andrea Ferrera tucked in a leathern belt, and a commodore's cocked hat on one side of his head. He was remarkable for always jerking up his breeches when he gave out his orders.

"I have been thus particular in his description," Knickerbocker concludes, "for the benefit of modern painters and statuaries, that they may represent him as he was, and not, according to their common custom with modern heroes, make him look like Cæsar or Marcus Aurelius or the Apollo of Belvidere."

Recent revelations of bad conditions in our prisons fall in with indications of a more enlightened popular view of the whole subject of the treatment of crime. The probation officer, the parole system, the small "home" for wild boys—all imply an attempt to treat, as much as possible, every "criminal" personally, to treat him, in other words, as a human being, and not as a type. This is summed up in a remark of Oscar Wilde's. In a letter hitherto unpublished, he wrote: "It is not the prisoners who need reformation. It is the prisons." This, if interpreted widely, is profoundly in line with our present feeling. What is needed in the way of reform is a radical improvement in our treatment of criminals, not only in captivity, but at large. We need to realize the great sensitiveness of the child and his infinite possibilities for development in either a good or a bad direction, depending on his environment, in the widest sense. And the only vital way, which at present seems practicable, to improve the "environment" of those already injured morally and nervously, is to give them a much greater amount of personal attention than is now the case. The drift is in that good direction.

Dr. Eliot reëchoes the materialism of forty years ago when he makes the surgeon the chief priest of his new religion. Perhaps there would be no objection if we could find a surgeon who made no mistakes. Forty years ago, "science" was to supply man with everything that he had been accustomed to look for in faith. But the science of a later day has been rather anxious to shift the burden of ministering to man's religious instincts. Science, in fact, has been catching the habit of summoning faith to its own aid, as a controversy now under way eloquently testifies. The present age has a little less confidence in doctors than we had two decades ago. The *materia medica* has had to stand some rude assaults. The surgeon's knife, it is true, has inspired reverence, but only a few weeks after Dr. Eliot propounded the substitution of scalpel and anæsthetic for crozier and incense, a medical congress at Berlin voted that surgeons operate too readily, in some diseases.

John H. Finley, president of the College of the City of New York, has been saying something which may seem radical to those who still feel the past only. "Look to the city-bred boy," he said, "for the great things in the future. The great problems of the future will be city problems. The men who have been bred in the cities, who understand them, and who have had the training, will solve these problems. Once he has acquired health and strength, the city-bred youth is far better fitted to go out into the world and make a name for himself than the boy from the farm. Temperamentally, he is better fitted for the struggle. His environment has made him so." The advantages of living in the country are as obvious now as they always have been. But as conditions are becoming more and more such as necessitate the bringing-up of our youth in the cities, the actual problem is how to train them there to the best advantage. By gymnasium exercise and other ways of keeping the body in good condition, the city youth may measurably attain to country vigor, and then may use it with greater effect than could their country cousins. When the latter come to the city, they flounder about for a time, unfitted to their surroundings and probably always somewhat handicapped. It is still true, we suppose, that the majority of leading men in a given city are country-bred; but the future, as President Finley said, may possibly bring a change.

The appearance of the first advertisement of aeroplanes for sale is startling proof that the heavier-than-air machine has reached the stage of commercial exploitation. We are happy to note this, for under the commercial test the development of the flying machine is bound to progress far more rapidly than when it is in the hands of rich amateurs or inventors backed by wealthy friends or the government. In Germany, the new Zeppelin company expects to make money, and the need of earning dividends will improve the Zeppelin craft far more rapidly even than the plaudits of the Emperor and the entire capital city. So with the aeroplanes; trade competition will soon show

how they can be reduced in size and cost and their safety increased. It is significant in this connection that the firm which advertises is a large automobile concern. Just as the bicycle-makers were compelled to turn to automobiles, and our best carriage-makers have made their carriage-building secondary to automobile bodies, so the automobile firms may, in turn, have to take up the new machine. It is certainly an inviting field for Yankee ingenuity and enterprise, particularly when such men as Curtiss and Wright are showing the way. We can sympathize with the resident of New Jersey, who, having had the distinction of owning the first automobile in that State, is now soon to receive an acroplane. But dangerous as the motor-car was, and is, it will seem safe as a baby-carriage beside the risks of the aeroplane, until that machine is better understood and further developed.

The recent Champlain celebration drew attention to one side of French genius which we Anglo-Saxons have been wont to slight. The story of the French in the New World is more thrilling, more compact of historical romance, than that of the English. This is not to compare the two peoples as colonizers; we all know how that competition ended. We are reminded of the hardihood of the old seamen who sailed the Saint Lawrence, when we read, in the London *Outlook*, a little article on "The Seaside Life of France." The London journalist has at last discovered that Trouville does not sum up the subject in one word. He writes, presumably of the Breton sailors who were later to exploit the Canadian fisheries:

> As early as the thirteenth century these simple and hardy sailors carried on an enormous trade. Their fleets traversed every sea. One captured the Canaries, another merchant squadron sailed up the Tagus and boarded the King of Portugal in his capital. . . . It was they who opened the fur trade in Canada and established a European colony in Senegal; and even now the men travel to the uttermost parts of the earth, and the women take their full share in the varied life of the great seaport towns and little fishing villages of the country.

It does, indeed, give one a start when, on a walking-tour that has taken one as far as savage Penmarch, one sees in the "best room" of a peasant's cottage trinkets and postcards sent home by seafaring sons and brothers from half the seaports of this travelled world.

When the German Reichstag assembles for its autumn session, an important question is expected to come up as a consequence of the fall of Von Bülow and the rearrangement of parties that led to it. This is whether a new President and new Vice-Presidents of the Reichstag shall be elected. The present presiding officers, Count Stolberg, the President, and Dr. Paasche and Herr Kämpf, the Vice-Presidents, were chosen by the *bloc* of party groups which the Chancellor organized to support his Government in the Reichstag elected in January, 1907. But that *bloc* is now disrupted. It was a fresh party alliance which overthrew Von Bülow and is now in Parlimentary control. And the expectation is that it will insist upon naming a new President and at least one new Vice-President. The desire to do this arises partly from a natural wish to emphasize the power of the new partly grouping, but also from the importance of having presiding officers in political sympathy with the majority. The President of the Reichstag, while not a party leader like our Speaker of the House of Representatives, is yet far from the detached and non-partisan position of the Speaker of the House of Commons. He has much to do with deciding on the order of business, and in acting as intermediary between the Reichstag and the Government, while in other ways he exerts powerful influence upon legislation. Hence it is not strange that a demand for a new President has sprung up, and bids fair to be the first interesting political question brought before the Reichstag.

The Kaiser's Colonial Secretary is developing into as indefatigable a circuit rider as the Kaiser's brother, Prince Henry, used to be a few years ago. Aristocratic Germany was outraged when William II named Bernhard Dernburg, a man who bore the triple curse of a plebeian origin, Jewish ancestry, and success in business, to replace a noble and incompetent director at the head of the Bureau of Colonial Affairs. The new director, who in a short while became a full-fledged Minister of the Colonies, brought in new blood with a vengeance. The Kaiser's colonies were in a bad way. German East Africa's principal crop, under fine militaristic cultivation, was native rebellion and discontent. German Southwest Africa was planted thick with the graves of poor fellows in the Kaiser's uniform sent out to butcher the Herreros and be butchered by them. Herr Dernburg began by clearing all the old bureaucratic lumber out of the Colonial Office; then he set out to see things for himself. He has visited the African colonies and laid the foundation for the building up of a permanent and profitable agriculture. In Southwest Africa the recent discovery of diamonds has proved a windfall to the new Minister. But windfalls as a permanent resource are not in Herr Dernburg's line. His heart is set on cotton. If German spindles can be fed from German cotton fields, one of the Kaiser's fondest dreams will be realized. With that end in view, Herr Dernburg is now on his way to this country to study the South and rob it of its secrets. This is an example of German method and application which has driven Mr. Balfour in despair to embrace protectionism.

The Spanish troops in Morocco have followed up an unlucky start with a splendid recovery. Mount Guruga, the Riff stronghold, is said to be virtually captured, and the Moors are negotiating for surrender. Undoubtedly it is the very poor beginning of the campaign that heightens the effect of the subsequent victories. The Spanish army had no such difficulties to contend with as the French did two years ago in Western Morocco. The latter had a coast-line of possibly one hundred miles to cover, with an indefinite hinterland. The peninsula about Melilla, where the Spanish campaign is under way, is hardly twenty miles by twenty. It is true that the mountain country gave the Riffs an initial advantage which the Chaouiya tribes lacked against the French. But the advantage was only apparent. By holding the Riff forces tied down to a few square miles of territory, it soon gave the Spanish troops a chance to corral them. When it comes to stand-up fighting between Europeans and the primitive peoples, the issue can never be long in doubt. It is the system of fight and scamper that uses up expeditionary troops. As it was, panic taught the Spanish government wisdom, and by throwing a good-sized army into Africa it has exacted almost dramatic vengeance on the Moors.

POOR CONGRESS!

In one of his Western speeches, the President said that, when he thought how much there was for Congress to do and how short the session must be, he could not but tremble. Yet his sensations can be nothing to those of Congressmen themselves. They see gradually unfolded before them an enormous programme. They are expected to reform the currency and perfect a banking system. Many laws respecting the conservation of forests, mines, and water-power are expected of them. A vast and complicated measure recasting the Anti-Trust Act is to be laid before them. They will also be asked to devise laws to restore the merchant marine. All these and other extra subjects of legislation will be loaded upon Congressional shoulders already bowed under the burden of passing the laws necessary for carrying on the government. The President speaks easily of the urgent need of cutting down appropriations by $40,000,000 or $50,000,000, but the labor involved in that alone is oppressive, and will tax the best energies of the best heads in Congress for many months. It would not be surprising, therefore, if members of the House and Senate, contemplating all this work piling up on them, should emit groans or despair.

As a matter of fact, however, they are, rather, chuckling to themselves and their friends with a touch of cynicism. They have been there before. This is not the first time that elaborate schemes of legislation have been pressed upon them. They have often before been called upon to reform everything out of hand, with a complete set of new laws. They have seen what has come of it. They have witnessed the impetuosity of an Executive dash itself to pieces against the stolid inertia of Congress. Large and glowing promises have before now turned out meagre and drab performance. So it is with a kind of amused wonder that Congressmen observe the President unroll to the gaze of the West his legislative programme. Their instinctive question is: "How much of it does he really suppose he will get?"

In trying to estimate the actual outcome of Mr. Taft's extensive proposals, we have to reckon not merely with the great difficulty of getting a large and unwieldy body to act together. That is initial, fundamental, and always present; but behind it there lies an even more formidable obstacle. This is the political hopes and fears of Congressmen. They will have to come before their constituents for renomination next autumn, and for election in the November following; and it is not too much to say that the thought of their own political fortunes will be uppermost in their minds during the entire session of Congress. That will be the test by which they will tacitly decide their attitude towards all controverted bills—"will it help or hurt my chances for reëlection?"

Now, the great Congressional rule is: When in doubt, do nothing. Members get contradictory advice. One set of newspapers urges them to act, another threatens to denounce and oppose them if they do act. From certain people in their districts they receive appeals and demands to support a pending bill, as one upon which the salvation of the country hangs; but by other voters they are warned that the measure is fraught with mischief and iniquity, and will be the political death of any member who favors it. The net effect is to intensify Congressional inertia, and to convince doubtful Representatives that their strength is in sitting still.

These well-known facts have gone to establish the tradition that it is impossible to extract any strongly opposed legislation out of Congress in the session immediately before Congressional elections. Caution and timidity are then the chosen counsellors, and the prevailing political maxim is: "Why can't you let it alone?" This dread of doing anything important with an election impending, was one reason given for summoning Congress in extra session last March to revise the tariff. With the memory of what happened after the passage of the McKinley tariff in 1890, Congressmen, it was felt, could not be persuaded to touch the explosive subject unless the political result was at least a year away. But the same reasoning will work powerfully for inaction next winter. This fact alone, in the opinion of good judges, will put any currency legislation out of the question. To this view, the Administration now appears to be quietly coming around, for the President intimated the other day that currency and banking reform would probably be deferred to the session of 1910-11. But Mr. Taft will find, if his other measures take on a sharply controversial aspect, that the tendency to postpone them, too, will be very strong.

This kind of inveterate cross-purposes between the Executive and Congress—the former pushing on and the latter holding back—seems inherent in our political system. The Administration and the majority in Congress do not stand or fall together. Congress practically says to the President, at the time of the elections midway in his term of office: "It is all very well for you to say that we ought to pass all these bills, but you don't have to go out and receive the verdict of the people, while we have. So you must not blame us for being a little more circumspect than you seem to be."

REORGANIZING THE DEPARTMENT OF STATE.

Recent Washington dispatches announced that Secretary Knox had appointed Henry M. Hoyt, Solicitor-General under the Roosevelt Administration, to be Counsellor of the Department of State. We have also had news of several other important appointments made in that Department. Additional bureaus have been created to manage its affairs. Two well-paid experts have been added to the existing Bureau of Trade Relations to collect information concerning foreign markets; and Bureaus of Far Eastern Affairs, of Latin-American Affairs, and of Information have been formed. These activities and others which are expected to follow indicate that a reorganization of the Department has been undertaken, upon radical lines, and that the most conservative of all the executive offices is entering upon a new epoch in its history.

Its former conservatism, however, has not been altogether of its own seeking, for successive Secretaries of State have for many years past informed Congress that the Department was not adequately equipped for its increasing business. The last and most forcible plea came from Secretary Root, who remarked that he was like a man trying to conduct the business of a large metropolitan law-firm in the office of a village squire. Until recently, the organization was, in fact, that which Hamilton Fish put into operation nearly forty years ago. Since then only minor rearrangements have been attempted.

But we should remember that before Mr. Knox's scheme of reorganization can be put into practice, it must be laid before Congress and receive the sanction of that body. Probably it will be approved in its essential features, for Congress has been moved to admit that the needs of the Department merit attention. At the last regular session, the Senate made provision for an Under-Secretary, with a substantial salary, and for a Fourth Assistant Secretary. This measure was regarded as so certain of adoption that Mr. Taft was supposed to have made selections to fill both offices; but the House at the eleventh hour threw it out, and when Mr. Knox took charge he was without the means of carrying out any schemes of extensive reform. The extra session of the new Congress afforded him relief by making an appropriation of $100,000 to enable him to investigate trade conditions in foreign countries, "and for other purposes," thus practically giving him complete control of the fund.

His reorganization, as it stands at present, presents anomalies which he must expect Congress to correct. The Assistant Secretaries of the Department and the Solicitor are appointed by the President after confirmation by the Senate, and each receives a salary of $4,500 per annum, except the First Assistant Secretary, who receives $5,000. The salary of the new Counsellor of the Department has not been announced, but is doubtless greater than the higher of these sums. The amount is fixed by the Secretary, who also made the appointment; that is to say, an officer whose commission is signed only by the Secretary of State is better paid than are those officers whose nominations have been confirmed by the Senate and whose commissions are signed by the President and sealed with the great seal. Somewhat similar conditions must prevail in Mr. Knox's newly created bureaus. For the Latin-American Bureau a former envoy to a South American country has been selected as chief; two consuls from the Orient are to assist in conducting the Bureau of Far Eastern Affairs. It is not probable that they have consented to serve for the pitiful salary of $2,100 a year, which is the amount allowed by existing law.

The regular bureaus of the Department are eight—Diplomatic, Consular, Indexes and Archives, Accounts, Rolls and Library, Citizenship, Trade Relations, and Appointments. To these Mr. Knox has already added three, and more are expected. There is now a Solicitor of the Department, with two assistants, and associated with these law officers we now have the new Counsellor. Thus there are four secretaries, eleven or more bureaus, and four legal officers to manage the affairs of the smallest of the executive departments. We are not saying that this is too great a number or that there is not work enough for them all, but it cannot be denied that there is a possibility of top-heaviness in the arrangement. It is clear that if it is to be permanent, Congress should equalize the salaries.

The State Department is the oldest of the executive departments, and its primacy has generally been recognized. Greater distinction of office attaches to the Secretary of State than to any other Cabinet officer. The fact that Congress has always paid less attention to that Department than to the others is, doubtless, because it comes hardly at all into direct contact with the people. There was reason in the advice which an old Representative once gave to a new member, when he told him to avoid service upon a fancy committee like that of Foreign Affairs, if he wished to make himself popular with his constituents, as they cared nothing about international questions. The Department which disburses no money in the districts has few means of obliging Congressmen or of advertising its needs to the masses of the people. While its salary scale actually remains where it was before the civil war, the scale in the other departments has been steadily increased; and while its business has expanded, it has hitherto received little increase to its force. If Mr. Knox succeeds in awakening Congress to the needs of his Department, he will deserve congratulations, for there may result an efficiency and dispatch in its business which have long been desired.

ENGLAND'S POLITICAL CRISIS.

Mr. Balfour's speech in Birmingham last week had long been looked forward to as an important political deliverance. Such it proves to be, though it is not a lightning-flash to clear up the political situation and show how the great crisis is to be met. The leader of the Conservatives does not deal in dangerous electrical displays. His thunderbolts are always sicklied o'er with the pale cast of philosophic doubt. If he has now gone further than ever before in advocating protective taxes, he has left in the clouds the vital question what the Lords are to do with the Finance Bill, when it reaches them next month. To say that it would not be for the House of Lords, but for the people, to decide, is to affirm only what the Prime Minister and Lloyd-George and Winston Churchill have repeatedly declared.

Nor can Mr. Balfour's arguing for tariff duties rather than taxes on land and incomes, be said to have made the course of his party unmistakable. In one way, it is true, he squarely met the issue. The Liberals have been insistently demanding that an alternative budget should be framed by those who so violently denounce the existing one. If you say our taxes are so bad, what taxes would you propose? Well, Mr. Balfour frankly admits that he should prefer taxes on imports. But that means, in England, taxes on food—on bread and meat. The Liberals in 1906 raised the cry of "free food," and won their great victory partly by leading the country to fear that the retention of the Conservatives in power would mean bread-taxes. This was indignantly denied at the time by the Tory leaders; but now they are forced to confess that such is their programme. Of course, they protest that they mean to begin with only a "little" tax, scarcely perceptible; but all the same they have definitely committed themselves to taxing the food of the people rather than the land of the rich. The Liberals could ask no better battle-cry.

Moreover, there is a distinct breach in his own party which Mr. Balfour's words must have widened, rather than closed. There are many Unionist free-traders, who, if the Conservatives are to go in for protection, ought to be read out of the party. And they were to be read out, we were told. Yet recently several of them have been agreed upon as Conservative candidates for Parliament. For the representation of Oxford University, the unrepentant Lord Hugh Cecil is to stand. Another Cecil, Lord Robert, has been accepted for Marylebone. In other constituencies, negotiations to a similar end are under way. It is said that, before the great

peril of Socialism, differences in the party must be sunk. But what the effect of this has been upon the out-and-out protectionists in the Conservative party, may be seen from the angry explosion of the *Morning Post*. Says this influential Tory organ:

> It is not surprising to learn that the suggested compromise between the leaders of the Unionist party and the small section of Free Traders is regarded with the utmost indignation by the majority of Unionist electors in the constituencies concerned. There is every justification for the feelings of exasperation aroused by a blunder which is as foolish and shortsighted as it is dangerous to the permanent interests of the party and the nation. The news of the proposed arrangement with Lord Robert Cecil and his companions may well fill all zealous Unionists with despair. It shows clearly that the same unpractical and incapable spirit which was responsible for the disaster of 1906 is at work within the councils of the party.

We quote this to show that, if the Liberals have their troubles, the Conservatives have theirs. In spite of all the talk about closing up the ranks against the common enemy, it is clear that Mr. Balfour's followers are divided. They are not even convinced what the chief issue is to be—whether they are to be rallied against Socialism or against free trade.

Equal uncertainty shrouds the question whether the Lords ought or ought not to throw out the budget, and bring on a fateful Constitutional contest. The "Lords from the wild," as they call the peers who never go to the Gilded Chamber except to vote under orders, are getting the most dubious oracles from their party leaders. Professor Dicey has argued convincingly that the Lords have the right to reject a budget, but has no advice to give except that they should "feel assured" before acting. The *Spectator* for some time urged the Upper House to defeat the budget, but latterly has taken fright at the vital consequences of a struggle that might be lost, and now counsels the Lords to swallow the nauseous dose as best they can. Lord Rosebery, in his Glasgow speech, seemed about to come out boldly for rejecting the budget, but caught himself in time to warn their Lordships in the following terms:

> I have come to the deliberate conclusion that the Government wish the House of Lords to throw out the Finance bill. I think they believe it will cause an outcry in the country. In no other way can I explain the constant taunting and daring of the House of Lords that is visible in the speeches of ministers—not all, but some. If you wish a Briton to do a thing, dare him not to do it, and he is quite sure to do it, and I cannot help feeling that the policy of the Government is Machiavelian, and that their object is in these most injudicious speeches to spur the House of Lords to a decision which the Government desire.

Mr. Balfour's trumpet has now given an equally uncertain sound. We may well pity the sorrows of the House of Lords, trying to have somebody make up its mind.

The only Conservative leader who appears to have the courage of his convictions is the invalided Joseph Chamberlain. He sent a letter to the Birmingham meeting boldly expressing the hope that the House of Lords would "force a general election." This is only, of course, because he desires to have the issue of protection, of which he is the real begetter, brought to an early electoral test. To the taxes in Lloyd-George's budget, Mr. Chamberlain can have no settled objection, for he has himself advocated every one of them, including the super-tax on incomes, as well as the taxation of unoccupied land, sporting land, ground rent, and mineral royalties. He even advocated these taxes, "less," as he said, "for the amount they would bring into the Exchequer, than because" he thought "they would discourage certain arrangements which have been productive of much inconvenience and suffering to the community." But Joseph Chamberlain always flouts consistency, and will attack the budget all the more violently for embodying his own principles. The great decision, however, remains to be taken. The Finance Bill will reach the Lords early in October. If they screw their courage to the sticking-point and throw it out, they will precipitate a conflict which they know will result, if they lose, in their complete political extinguishment.

NEW-OLD NEW YORK.

We have always had extremes in American appreciation of America. The Yankee has either blatantly blown his own horn or else, even more odiously, has found nothing good in the land. Of all the tens of thousands whom we send abroad each year for "culture," too few reflect that there are things beautiful very close to them, things for which no admission price is charged. The rocks of the Maine seacoast are enjoyable outside of Winslow Homer's canvases. American young-womanhood, placed in a proper setting, is beautiful, even when unportrayed by Mr. Tarbell.

A fresh application of these well-worn truths is suggested by the fact that the Macmillans have just published a new picture-book on the scenes and the people of Greater New York. They are lucky enough to have Prof. John Van Dyke and Mr. Joseph Pennell as author and illustrator. In turning the pages of the volume, in lingering over the sketches in crayon and black-and-white, one is reminded that a good memory often consists in knowing how and what and when to forget. Art consists, no less, in knowing what to eliminate. The artistic conscience, like every other variety, must be "under control." This is not to deny that there are aspects of our new American cities which offer ready-made art-matter. What we have seen and appreciated as picturesque in Europe, or in picture shows of the past, we recognize for its own value, even though it be found at our very elbow. We readily see the romance of the harbor. We concede the attraction of Washington Square, done in an old-world manner. But what of the skyscrapers? What of the shabby elevated structures, and our teeming bridges? Precisely these, for at least one artist and one art-critic, have now proved enticing subjects. Rightly enough, Mr. Van Dyke says that our painters have commonly been a little bewildered by the bigness of New York:

> They do scraps of color, odd bits along the Harlem, a city square or street; but, with a few exceptions, they have not risen to the vast new city. That the "big" things, the high bridges, the colossal skyscrapers, the huge factories, the enormous waterways, are pictorial in themselves needs no wordy argument. . . . The material is here, . . . and it needs only the properly adjusted eyes to see its beauty

It is, perhaps, the encroachment of the new New York on the old that offers the artist his greatest opportunity. Others grasped this fact before Mr. Pennell set about representing sights which, but for the accident that there are "more 'no eyes' than eyes," we should be seeing every day and hour. No one has succeeded better here than Mr Mielatz in such an etching as his "Cherry Street," with the elevated ironwork shadowing the crooked lane of tenements, with which it makes a perfect composition. If only we could learn

the uselessness of trying to compare our modern cities with those which we more readily admire,—having good precedent! For New York is to the age of the aeroplane what Babylon was to the period of hanging-gardens, and London to the heyday of Vauxhall. New York and Paris cannot be studied upon one level; they are to be appraised only in their adaptation to their respective origins and uses. Therein we may win a certain reassurance.

Under the circumstances, Professor Van Dyke's attempt to compare the wild beauty of New York with that of the city on the Bosphorus, fails to move us. Walt Whitman, idly turning these pages, would have indignantly quoted two verses from his own poem, "Crossing Brooklyn Ferry":

> Now I am curious what sight can ever be more stately and admirable to me than my mast-hemm'd Manhattan,
> My river and sunset, and my scallop-edg'd waves of flood-tide.

Since the author of "The New New York" lauds as he does the wonderful clearness of American skies, it seems a bit queer that he should wish to make us believe that this city of ours is another London, too. "October with its bright light and high color has also its lilac or purple haze," he writes, and adds:

> The haze does not belong exclusively to the woodlands, though in the Central Park it lurks along the driveways, rests upon the Mall, and floods in and out among the trees and rocks and flowers. . . . It fills the whole lower avenue, surrounds the towers and steeples and cornices, and draws its mauve-hued veiling across the sharp prow of the distant Flatiron, making of that much maligned structure a thing of beauty. . . . The more dust and automobile smoke, the heavier is the atmosphere, and the more perfect the ensemble.

A double allurement has always been recognized in beauty half-veiled, and this principle of æsthetics or psychology applies to architecture as aptly as to anything else. Yet we should have liked it better had this amateur of the new New York stuck, either to the romance of the city as it is found in an occasional resemblance to old-world places, or else to the notion that sky-scraper and elevated systems are in themselves romantic.

THE FUNCTION OF SHYNESS.

From Berlin was reported, a few days ago, an extraordinary case of metamorphosis. Orville Wright was installed in the most expensive hotel in town, in the suite recently occupied by Cipriano Castro, hobnobbed daily with princes royal, slapped ambassadors and Imperial counsellors on the back, went to five o'clock teas, and liked it. This was the Orville Wright who only a few weeks ago pushed his derby far back on his head, put his thumbs into the pockets of his waistcoat, and said "How de do!" to the President of the United States.

At Fort Myer, however, it was embarrassment, where in Berlin it was nonchalance. So long as his work was still before him, Orville Wright hated reporters, fled from the presence of Congressmen, and stammered lame explanations to interested ladies. The triumph at Fort Myer was a double victory. It was a conquest of the air and a conquest of the demon of shyness which besets most truly creative workers in the midst of their tasks. That is the penalty of intense preoccupation in the inventor, the scholar, the thinker. If we reason superficially, we say that shyness in such cases proceeds from an overpowering desire not to be interfered with. But that is a minor cause. Actually, the mind that is possessed with a single great problem is so overcharged with the importance of it that it destroys all other values in life. Not to solve the problem is to be a failure, and the inventor whose plane resistances are not quite worked out, or the philosopher whose separate principles fail to dovetail, is bent down in the most sincere humility. He is shy because he cannot do the only thing in life worth doing, cannot be the only thing in life worth being. He cannot meet his fellows on an equal footing.

But when the scholar has initialled the final proof-sheet of his *magnum opus*, when the machine flies an hour and a half and comes to the ground without breaking its propeller, what a change the ironic muse is frequently compelled to record. The example of the Wrights here fails us to a certain degree. They, too, have felt the wings of victory fan their cheeks into a warmer glow, but in spite of Cipriano Castro's royal suite, Yankee wit steeped in Ohio atmosphere will probably succeed in keeping its balance. But of shyness there can no longer be any question. Stern fate, which decrees death to the conquered, just as remorselessly binds the victor to the wheel of publicity. Formerly the successful man was expected to enjoy the world's adulation or leave it alone, as it pleased him best. To-day there is no choice for him, for fame is no longer a pleasant sensation to be tasted, but a commodity to be capitalized and trafficked in. Tame the air, range the African wilds with your gun, or discover the Pole, and you are immediately the profit-taking victim of every instrument capable of impinging on the public ear drum. The linotypes cry, "Talk through us"; the phonograph machines plead, "Shout through us"; the color-presses beg, "Paint through us"; the moving-picture screens implore, "Hop, skip, jump, climb, fall, and rise on us." Fame's commercial agents knock her victims down with golden bludgeons and exhibit the body to the populace, to the victim's enormous profit. Under such circumstances how can shyness walk hand in hand with success?

And the timid triumphator finds it hard not to yield. It is not only the temptation of gold and power. It is the great love for his fellowmen that always burns in the heart of the diffident man. For let it be said again, the shy man's fear of people arises from a profound humility and an exalted altruism. The shy do not think their mere common humanity a sufficient title to the attention of those around them. They must earn that attention by service. They go about pleading, "Let me do something for you. Let me build your aeroplane for you. Let me map your Arctic zones for you. Let me find the ideal form of government for you." The love is there; but it finds expression in service. What wonder, therefore, if when the service is completely rendered, that shyness should show all at once the social passion that has always been there. Airily we say that, of course, extremes run into extremes, that timidity leads to paranoia. Actually the warm soul has always been there, glowing behind the mask.

Thus Nature once more manifests her magnificent adjustment of means to end. When she has picked out genius to do her work, this one to ride the clouds or charm the tides, and that one to recover the secrets of the dead past or to fashion the pillars of the future, she sets them apart from the rest of the world. She protects them against the idler, the fool, the pretender, the bore.

the empty chatterbox, and the curious bystander by throwing over her chosen ones the impenetrable armor of self-consciousness and shyness. In monastic seclusion, they do their work and serve her ends. When the work is done and her ends are attained, Nature, in her magnificent cruelty, snatches from them the armor of their diffidence and leaves them naked to the allurements of the world, the flesh, and the devil.

THE METAPHYSICIAN OF THE LIFE-FORCE.*

I.

Out of the many new conceptions and new formulas for the universe that have been engaged in so confusing a struggle for survival in the reflection of the past century, at least two appear to emerge from the welter in flourishing condition. And these two, different though they are in origin, have shown so marked an affinity for each other that they may be said to have mated and brought into being a new view of the general nature of things, which shows every promise of great influence, if not of dominance, in the philosophical and religious thinking of the newer generation. These two conceptions are, first, the doctrine that the reality manifested in the world of our experience is at bottom a blind, striving, unresting, expansive Will to Live, *Wille zum Leben*, a reality that is in some degree revealed inwardly in man's volitional life, but is more fundamental than intellect; and, secondly, the doctrine of cosmic and organic evolution. The first has tended, of late, to be taken in a very un-Schopenhauerian, because unpessimistic, sense; and the second in a very un-Darwinian, because unmechanistic, sense; and their issue, when so taken, is a way of thinking about the universe which may be characterized as an evolutionism at once radical and romantic.

A "radical" evolutionism means a policy of thorough in the application of the idea of development to the universe; it means conceiving of the world through and through—or, at least, all of it with which men have any sort of concern—as subject to change, to becoming, to gradual self-transformation, and to cumulative self-augmentation. Thoroughness in this way of thinking is not a thing to which the human mind has naturally inclined; and it has not been common in philosophy or theology, even since evolutionary ideas have come into vogue. We have, indeed, had in the course of the nineteenth century many systems of thought in which the idea of evolution, in a broad sense, has played a great part. The German philosophers of the romantic period, in their "philosophies of history," and even in their metaphysics, often seemed to be giving an essentially dramatic version of the nature of the world; the cosmic piece seemed to have action and plot and a gradual unfolding, and even moments of suspense and uncertainty. No small part of the charm that Hegel exercised over many minds in his own time and since, lay in that aspect of his system wherein all human history was pictured as but a long, slow, painful urge and struggle of the Absolute Spirit, through vicissitude after vicissitude and negation after negation, toward a larger and more manifold life, a fuller self-affirmation, a freer forth-putting of power. Hegel's seemingly arid logic was, after all, as Professor Royce has said, the logic of passion, and more specially of the passion of struggle and expansion: "his Absolute was a man of war." But in this romantic evolutionism Hegel never dared to be radical. Struggle and becoming and progress were not the last words of his philosophy; rather were they descriptive of specious but illusory aspects of the universe. When all was said, time itself was a false appearance; the Logic was but a changeless scheme of relations between concepts, to which it was not in the least essential that they should be unfolded successively and gradually; and the Absolute was not really engaged in the hazards or hampered by the oppositions of the battlefield, but was eternally at peace and eternally triumphant. The same must be said of the philosophy of Schopenhauer; his *Wille zum Leben*, through some brilliant rhetorical hocus-pocus, came out at the end strangely metamorphosed into identity with the dreaming, if not, indeed, the dead, Absolute of Hindu mysticism.

II.

Thus throughout most of the nineteenth century—the century of evolutionary ways of thinking in all the provinces of thought—both the idealistic philosophers and popular theology have taken their evolutionism with reserves—have, indeed, made it always subordinate to its logical opposites in metaphysics, the "creationism" of Hebrew cosmogony or the "emanationism" of the later Platonists. Both these fashions of conceiving the temporal aspect of things assume that a sort of Being that is perfect and infinite and omnipotent must have come first in the order of existence—first logically and chronologically and causally; and, what is more, that such a Being, even though it somehow engenders a world of beings imperfect and finite and destined to struggle and to gradual development, remains itself withal no less perfect and infinite and unperturbed. In short, even since the general diffusion of the idea of development, theology and the more religious sorts of philosophy have, as a rule, continued to take for granted that essentially emanational conception of the becoming of things which the Angelic Doctor explained to Dante in the Fourth Heaven:

> All things, whether mortal or immortal, are naught but the radiance of that Idea which, in His love, our Lord God brings to birth; for that Living Light which so proceeds from Its lucent source that It is not disunited from It, . . . through Its own bounty collects Its rays, as it were mirrored, in new existences, Itself eternally remaining one. Thence, by degrees, It descends to the nethermost possibilities of being, lending to each in turn reality, becoming such that finally It makes naught save short-lived and contingent entities—by which I mean the generated things that the heavens in their motion produce.

A habit of mind rooted so deep, not merely in philosophical tradition, but in the long-established preconceptions of popular thought, is not changed easily, nor without profoundly changing the temper and attitudes of men's minds at many other points. It would not be easy, therefore, to exaggerate the historic interest and significance of the fact that a genuinely radical evolutionism, which is at the same time of a highly romantic and religious spirit, is just now receiving vigorous and frequent expression from men whose ideas have exceptional currency and influence. It was, for example, this view of things, which was expressed in popular language by Mr. Bernard Shaw, in one of the most serious and sincere of his utterances—his address on the "New Theology." Some of it is worth recalling here, for the sake of the perfect antithesis it exhibits to the passage I have quoted from Dante. Theology, Mr. Shaw insists, has always made "the entirely gratuitous assumption that the force behind the universe is omnipotent." We must rather conceive of it

> as a bodiless, impotent force, having no executive power of its own, wanting instruments, something to carry out its will in the world making all manner of experiments, creating birds, reptiles, animals, trying one thing after another, rising higher and higher in the scale of organism, and finally producing man. . . . Instead of the old notion that creation began with a God, a personal being, who, being perfect, created something lower than Himself, the aim of the New Theology is to turn the process the other way, and to conceive of the force behind the universe as working up through imperfection and mistake to a perfect organized being, having the power of fulfilling its highest purposes. . . . The object of the whole evolutionary process is to realize [*i. e.*, make real] God.

It is substantially the same type of doctrine that Professor James gives us in the concluding chapter of his volume on Pragmatism, in which he sets forth the sort of metaphysics towards which Pragmatism points—"the hypothesis of a world growing, not integrally, but piece-meal, by the contributions of its

*L'Evolution créatrice. Par Henri Bergson. 4me éd. Paris. 1908.

several parts." And in his latest book it is as much in a radically evolutionary as in a "pluralistic" universe that he finds the only possible "escape from the paradoxes and perplexities that a consistently thought-out monistic universe suffers from—the mystery of the 'fall,' namely, of reality lapsing into appearance, truth into error, perfection into imperfection; . . . the mystery of universal determinism, of the block-universe eternal and without a history."

III.

But there have been two chapters in the history of the influence of evolutionary ideas in nineteenth-century thought. If the first part of the century was filled with idealistic philosophies, of the romantic type, but only half-hearted in their evolutionism, the second half has been filled with doctrines in cosmology and biology that may appear sufficiently radical in their application of the conception of evolution, but are scarcely of the romantic temper. For these take their evolutionism as part of a mechanistic philosophy of nature; the world is, indeed, treated as involved in a consecutive process of development, but that process is regarded as wholly reducible to a mechanically necessary series of changes of spatial position in the parts of a closed physical system, whose constituent sum of matter and energy is never either increased or diminished. In such a scheme there can, of course, be no element of contingency and real struggle; nor can there be any true evolution, in the sense of an actual augmentation and transformation of the world as a whole. The process could have no more dramatic interest than the shiftings of the relative positions of the pieces in a kaleidoscope

The classic example of this kind of evolutionism—or of an attempt after it—is, of course, the system of Herbert Spencer—in that part of it which deals with "the knowable." The notorious inconsistencies of the result were doubtless inevitable consequences of the nature of the enterprise; for it is hard, if not impossible, to write voluminously about evolution without implying that something is really getting evolved—that there are from time to time emerging new qualities in things, fresh increments of being, new items of content in the universe. However sure the philosopher may profess to be that the whole transaction is nothing but "the continuous *redistribution* of matter and motion," he is not likely to be content to limit his philosophizing to the corresponding programme—that of chronicling, with the help of the laws of motion, the successive migrations of each changeless atom from point to point in the infinite inane. Evolution and mechanism are—though the fact has been but rarely suspected—profoundly uncongenial notions; and Spencer's reading of the universe is therefore full of irrepressible romantic elements that accord ill with the professed first principles of it. With the universe at large Darwin troubled little; but in the specifically biological application of the idea of evolution, he, too—or his followers, more Darwinian than he—reduced development to an essentially mechanical process. Organisms—living, self-reproducing, variable—he took for granted; but their variations were but random fluctuations, such as the mathematical theory of probabilities would require; and the progressive diversification of species and adaptation of functions to needs, in which organic evolution consists, was declared to be but the necessary outcome of the rigid pressure of external physical conditions, by which misfits were automatically crushed out.

Such theories, it is evident, are not truly radical forms of evolutionism; they give little or no recognition to the idea of spontaneous, forward-reaching, cumulative development. Against this arrested evolutionism of mechanistic science there is now taking place a rebellion not less noticeable than that against the arrested evolutionism of absolutistic metaphysics. A singular recrudescence of vitalism has been one of the most conspicuous tendencies of the past decade among German biologists. And neo-vitalism, as Dr. Ludwig Stein has remarked in a recent survey of that movement, "is a sort of romanticism in natural science." With however little warrant in biological knowledge, the popular preachers of radical evolutionism have likewise often rejected with vehemence the Darwinian and Spencerian conceptions of evolution. Mr. Archibald Henderson has lately classified Mr. Shaw, upon that writer's own authority, as "a confirmed neo-Lamarckian," and quotes him as saying that we must "conceive the will as creative energy, as Lamarck did, and totally renounce and abjure Darwinian, Marxian, and all fatalistic, penny-in-the-slot theories of evolution whatever." Nietzsche, long ago, characterized the hypothesis of natural selection—according to which evolution results wholly from the pressure of environmental conditions upon merely plastic organic material—as "the idea of a neurasthenic."

IV.

These historical preliminaries may, perhaps, serve better than an equal amount of direct exposition to make clear the nature and the significance of M. Bergson's philosophy. He is primarily the systematic elaborator of the metaphysics of radical and romantic evolutionism. As such, he unites in a new way several diverse streams of philosophical tendency. He revives something of the philosophy of the German romanticists, and he is, perhaps, not completely innocent of certain of their faults; for in some of his less felicitous ingenuities unsympathetic readers of scientific training may find a resemblance to features of that *a priori* and over-imaginative *Naturphilosophie* by which Schelling and Hegel brought so much scandal upon the entire guild of philosophers. But he is free from their logical formality and artificiality in his manner, as he is of their Absolutes and Eternals in his doctrine. Again, like Hegel he is peculiarly akin to the philosopher of Ephesus among the ancients—he is a sort of modernized Heraclitus; but he is thorough-going in his "flowing philosophy," whereas Hegel was a Heraclitus afraid of the fire. With these affinities to earlier schools, M. Bergson ought also to be regarded as the successor of Spencer in the attempt to give a comprehensive philosophical interpretation and generalization of latter-day evolutionary science, and especially of the results of nineteenth century biology. But he finds that Spencer had no sooner embarked upon this enterprise than he stopped short:

> He had promised to trace a genesis—and forthwith you find him doing something wholly different. His doctrine bears, indeed, the name of evolutionism; it professes to remount and then follow down the course of the becoming of the universe. But in reality it has nothing whatever to say about either becoming or evolution.

As little can M. Bergson accept the biology of Darwin. He is, indeed, too familiar with Lamarck's text to be willing to call himself "a confirmed neo-Lamarckian"—especially since he does not much believe in the inheritance of acquired characters. But he regards neo-Lamarckism, in the form given it by the late Professor Cope, as far nearer the truth than Darwinism; it is, "of all the contemporary forms of evolutionism, the only one which can find any place for an internal and psychological principle of development, even though it does not itself necessarily make use of such a principle."

V.

For M. Bergson, evolution is essentially "creative"; is a *devenir réel*, a process in the course of which there is an actual and absolute coming into being of new items of existence, which not only were not contained in any preceding stage of the process, but were not even, in any intelligible sense, necessary or predestined at any such earlier stage. The reality of which evolution manifests the nature is an expanding life-force, an *élan vital*, an inward urge in things, a *poussée intérieure;* and "the rôle of life is to bring about indeterminateness in the behavior of matter. In proportion as life evolves, the new forms which it engenders are undeterminable, not to be foreseen." This does not mean, of course, that all is caprice

and disorder; the creative achievement of the life-force is slow and is always obstructed by the inertness and mechanical rigidity of matter. Moreover, as we look backward over its past achievements we see a certain amount of uniformity in life's creations; they exhibit a certain consistency of style. The process moves in a single general direction, and within distinctive limits; but it does move, and always at the growing points of the universe things in some measure unprecedented and unpredictable are coming to the birth.

Not that organic evolution is held by M. Bergson to be rectilinear. The *élan vital* is not like the god of the "Bridgewater Treatises," a clever artificer, seeing its goal from the start and neatly adapting means to ends with undeviating continuity. M. Bergson intends his doctrine to be as remote from the teleology of the natural theologians—evolutionist or pre-evolutionist—as it is from the machine-theory of nature. The life-force at first moves upon its way blindly and fumblingly. To make progress, to express its nature, it must work through a matter that is alien to it and refractory to its purposes. In adapting itself thus to external conditions, it makes many a false start, and enters many a *cul-de-sac*. Even apart from these obstacles, it tends of its own nature to split into divergent lines of evolution; for "life is essentially active force," and it is characteristic of such a force to radiate "sheaf-wise." The lower organisms, therefore, are not to be regarded merely as so many necessary stages in an orderly march of the life-force towards man or a beyond-man. They are in part unfinished side-tracks. But upon no line save one—not even in the elaboration of instinct, so admirable in certain of the insects—could life find the free course in which its own meaning, its latent tendency, might be adequately realized. That could be found only through the evolution of intelligence and reflective reason. Inferior to instinct though reason often is in effectiveness and vigor of action, it has two decisive superiorities. It is capable of unlimited expansion; in the rational animal, "for each need that is satisfied there is created a new need; and thus —unlike instinct, which forms for the animal a closed circle of automatic activities—intelligence opens to activity a field of indefinite extent, in which it may push ever farther and farther on." Above all, in rationality the life-impulse attains to self-knowledge. It makes at least partially explicit in the form of conscious purpose the meaning and central drift of what had hitherto been but a blind and often a futile pressure.

Yet rationality itself is a dangerous instrument for that very force which has fabricated it. For it is oddly prone to take itself for something more than an instrument. It is, to change the figure, a child constitutionally incapable of ever quite understanding the parent that begot it. For its idiosyncrasy, as a specific process, is that it must needs endeavor to represent things as discrete and as somehow fixed and crystallized; whereas, the real stuff of experience is continuous and is in perpetual flux. What is worse, reason, as the history of philosophy and that of religion abundantly show, has a perverse inclination to turn against the business and traditions of the house of which it is sprung and from which, in truth, it derives all of its support. The hard-won capital of life is thus turned against the ends of life; in intellectualist philosopher, in ascetic moralist, in other-worldly mystic, the will to live, active even here, is strangely set in activity against itself.

Yet for all these excesses of the intellect, M. Bergson is confident that a true philosophy will provide a corrective; for reason has, after all, the saving grace of being able to recognize its own limitations. So chastened, reason will make, even in the philosophic activity itself, for the service and the intensification of life, not for detachment from life nor for superciliousness towards any of life's manifestations:

> More modest is the philosophy which we propose: modest, and yet it alone is capable of being carried through to completion. The human intellect, as we conceive it, is not at all such a thing as Plato represents in the allegory of the cave. It is as little its function to gaze idly upon shadows as they pass as it is, turning backward, to lose itself in contemplation of the celestial splendor. It has other work to do. Yoked, like oxen, to a heavy task, we feel the play of our muscles, the weight of the plough, the resistance of the soil. To act and to know that we act, to enter into contact with reality—indeed, to *live* reality, yet only in the measure in which it is involved in the work that is in process of accomplishment, the furrow that is being drawn; such is the function of man's intellect. . . . Philosophy can be but an effort to immerse oneself afresh in the universal life. The intellect, coming into touch again with the source from which it sprang, will, as it were, live over again in reverse order its own genesis. But the enterprise is not one to be achieved at a stroke; it will necessarily be collective and progressive. It will consist in an exchange of insights which, correcting and supplementing one another, will enlarge this human nature of ours, and in the end enable it to transcend itself. . . . Such a philosophy, which seeks to absorb intelligence again into intuition, does more than simplify speculation. It also gives greater energy for action and for life. For with it we no longer feel ourselves isolated in humanity, and humanity itself no longer seems to us isolated in the nature over which it rules. As the smallest grain of dust is one with our whole solar system, drawn along with it in that undivided movement of descent which constitutes materiality, so all organic beings, from the humblest to the highest, . . . in all places as in all times, do but make manifest a single impulsion, contrary in its movement to that of matter, and, in itself, indivisible. . . . The animal supports itself upon the plant, man goes astride of the animal, and all humanity, scattered through space and through time, is one immense army galloping beside and behind and in front of each of us, drawing us on in a sweeping charge that can beat down every resistance and override many an obstacle, perhaps even death itself ("L'Évolution créatrice," pp. 209 and 293-4).

VI.

Not every designer of a *Weltanschauung* can be called, in the more exacting sense of the word, a philosopher. And it is, perhaps, by this time apparent to the judicious reader that M. Bergson has gifts of imagination and of style that are perilous possessions for one who would practise the austerities of philosophic thinking. He has, in particular, a remarkable fertility and felicity in metaphor and analogy, in concrete and pictorial ways of expressing or illustrating abstract ideas; and this talent betrays him more than once, and occasionally at somewhat critical transitions in his argument, into letting a simile do duty for a syllogism. Thus, the reasoning of a passage which I have already summarized would, if writ large, apparently work out into something like this: The *élan vital* is somewhat similar to an acting force in dynamics—though in essence very different; the lines in the field of force of certain bodies (namely, of magnetic, bipolar bodies) have, when plotted, a radiating or sheaf-like shape; *ergo*, life necessarily evolves from a single focus upon divergent lines. The logic here is scarcely of irresistible cogency. Nor is M. Bergson at all constantly mindful of one part of his doctrine when expounding another. For example, he is a believer in the biological hypothesis of orthogenesis, which asserts that organisms vary from generation to generation along determinate and restricted lines. But this means that the transmission of life takes place precisely as the action of force does not; for the latter, apart from the action of antagonistic forces, spreads out equally and evenly in all directions. Again, our metaphysician has an incorrigibly dramatic imagination; the tendency to personify and hypostatize is strong in him. Consequently, though the life-force below the stage of rational consciousness is nominally defined as blind, as innocent of foresight and design, in point of fact the whole evolutionary process is portrayed as a sort of contest of wits between Life, as hero, and Matter, as villain; we find Life figuring as a veritable Odysseus of many wiles, putting up clever tricks upon his duller adversary, achieving an end by indirection where a frontal attack has failed, building up complex and delicate instruments to serve his ulterior purposes, and in general behaving with singular ingenuity and foresight. M. Bergson's promise to

refrain from using the conception of "design" is very imperfectly fulfilled. It results from such traits that he leaves many matters deeply obscure, and the more obscure the more closely his account of them is scrutinized. Most elusive of all is just this central duality of life and matter; their supposed relations, and their status with respect to the old controversies of realist and idealist, are never, I think, made wholly intelligible.

It ought, finally, to be said, with all the more emphasis because of these lapses from the rigor of the game—that M. Bergson has made at least one exceedingly important contribution to philosophy in the strictest sense. He has presented what is to the philosopher more precious than the most imposing of conclusions; namely, a decisive premise from which significant conclusions can be drawn. He has, in a word, struck out a distinctive, and trenchant piece of dialectic. It is hardly the sort of thing that can be made either comprehensible or interesting to the untechnical reader in a paragraph; yet, in essence, it amounts to so simple a thing as the discovery of what is implied by the fact that we undeniably experience temporal duration. The genuinely temporal has usually fared ill at the hands of metaphysics, and even of science. But through M. Bergson, it promises to come into its own—almost for the first time since Heraclitus. For the author of "L'Évolution créatrice" has, I think, put philosophers upon the way to a proof that our time-consciousness is incapable of inclusion within the being of any immutable Eternal, and is even incompatible with the assumption of the existence of such an entity; and that it is, in the last analysis, not less incompatible with the supposition that the world as a whole is a static system, constant in its total content and its ultimate qualities, such as mechanistic science has for certain purposes found it advantageous to postulate. M. Bergson has thus furnished at least the beginning of a demonstration that the nature of the universe is best understood in terms of process, of development, of the literal coming into being of new increments of reality; so that it may never be fully and intimately apprehended save through the inner experiences of life itself, through conscious participation in the travail of creation. The metaphysician of radical evolutionism has, in short, over-loaded that doctrine (in view of its youth) with questionable detail and with romantic embellishments; but he has also fashioned and put into its hands potent weapons of persuasion. Than its entrance upon the field as a well-armed and militant philosophy, there have been not many more memorable occurrences in the history of ideas.

A. O. Lovejoy.

NEWS FOR BIBLIOPHILES.

Robert Hoe, who died in London on September 22, was perhaps the greatest of American book-collectors, and the library he formed, while not so complete in certain lines as the collections formed by James Lenox or John Carter Brown, well deserves to be classed with the libraries of those two early collectors.

Seventy years of age at his death, Mr. Hoe had been a book-collector for more than fifty years. It was he who gave encouragement to D. G. Francis to reprint Collier's "Bibliographical Account of the Rarest Books in the English Language," in four volumes, 1866, and in 1880 he edited a new edition of Maberly's "Print Collector." Reproductions of nearly two hundred "Historic and Artistic Book-Bindings" in his library, forming two volumes, 4to, were published in 1895. With William Loring Andrews, Theodore L. De Vinne, Brayton Ives, and a few others he founded the Grolier Club in January, 1884, and he was its first persident.

Mr. Hoe was for many years a liberal bidder at most of the important book sales in America and abroad. In the early days he and Mr. Andrews would send their bids for London auctions together. When the books were received they would draw lots as to who should have the first choice.

The various Catalogues of his printed books have been noted from time to time in these columns as they appeared. The first portion, English books issued before 1700, 5 vols., was published in 1903-1905, describing 2,875 titles. In 1905 appeared also the Catalogue of English books after 1700, 3 vols., describing 4,118 titles. Then, in 1907, the Catalogue of books in foreign languages issued before 1600, with 1,346 titles; in 1908 the Catalogue of his Emblem books, 463 titles; and this year, the Catalogue of hooks in foreign languages after 1600, 4 vols., describing 5,228 titles. In all, the fifteen volumes contain descriptions of 14,030 titles, forming 20,962 volumes.

He was preparing a Catalogue of his illuminated manuscripts, and just before he sailed, he was considering whether to issue it uniform in style with the catalogues of printed books, or to adopt a larger page, so as to allow for adequate reproductions. These manuscripts were his choicest treasures, and were kept by themselves in a room opening off from his bedchamber. For number and variety they can be compared with no other collection in this country, save only that of J. Pierpont Morgan. The most valuable single manuscript in the Hoe collection is, probably, the Pemhroke Missal, acquired in 1891 from the Brayton Ives Library. This Book of Hours was written, probably about 1440, for William Herbert, first Earl of Pemhroke, and contains 267 miniatures, besides decorated horders and a vast numher of ornamental initials. The Charles VII Missal, from the Didot Sale, afterwards in the Ahby E. Pope collection, is another celebrated manuscript, and was acquired hy Mr. Hoe in 1895.

An account of the Hoe Library, prepared about fifteen years ago hy O. A. Bierstadt, makes a volume of 224 pages, with 110 illustrations. But many important works have since heen added, notably two copies of the Gutenberg Bible, one on paper and one on vellum, which must have cost Mr. Hoe upwards of $35,000. These are the copies which were formerly in the library of Frederick Perkins, the brewer, and which, in his sale in 1873, brought £2,690 for the paper copy and £3,400 for the vellum copy. Both were bought by the Earl of Ashhurnham, who parted with the paper copy privately. At the sale of his library in 1897 the vellum copy was bought by Quaritch for £4,000.

While the Almon W. Griswold and Charles H. Kalbfleisch collections were dispersing piecemeal through various channels, Mr. Hoe was fortunate enough to secure a number of valuahle hooks. From the Griswold collection he got the Charlemont copy of the first edition of Higden's "Polychronicon," printed by Caxton in 1482, undouhtedly the finest copy known; Lydgate's "Siege of Troy," printed by Pynson in 1513; Ben Jonson's Works on large paper, and others. Among many hooks from the Kalbfleisch library, mainly Americana, we may note the original Italian edition of Vespuccius's account of his four Voyages, printed, prohably at Florence, in 1505 or 1506, one of five known copies and the only one in America; three Latin editions of Columbus's first letter, all printed in 1493, and many later books, including a copy of the "Declaration of Former Passages and Proceedings hetwixt the English and the Narrowgansets," four leaves, printed by Steven Daye in Cambridge in New England in 1645.

From the Pope collection, hesides the Charles VII Missal, he secured two of his finest Caxtons, Malory's "Morte D'Arthur" (1485), the only perfect copy known, and Gower's "Confessio Amantis" (1483), as well as several Shakespeare quartos and many other hooks.

Mr. Hoe was always fond of fine bindings, and many historic specimens are in his library. About ten years ago, he, with a few other members of the Grolier Club, organized the Cluh Bindery. He was its principal support during its existence, and much of its finest work was done upon his hooks.

Mr. Hoe often said that, as he had enjoyed so much the hringing together of the books, he wished them to give a similar pleasure to other collectors in future, and that he expected the library to he ultimately dispersed at auction. Nothing is known, as yet, as to his final instructions about its disposition. If sold at auction it would form the most wonderful series of sales that has ever taken place.

* * *

The hook-auction season of 1909-1910 has already hegun in Boston, Libhie & Co. having had sales on Septemher 14 and 15, 22 and 23, and 29 and 30. On October 6, 7, and 8 they sell the libraries of the Rev. T. M. Harris and T. W. Harris, including interesting American items, manuscript and printed.

The season in New York begins on October 5, hoth houses holding sales on that day. The Merwin-Clayton Sales Company's first sale, October 5, 6, and 7, is a miscellaneous collection of Americana, without items of especial note.

On October 5 and 6 the Anderson Auction Company will sell the library of Dr. F. C. Rohinson and other properties; on October 7 and 8 a notahle collection of first editions of American authors, among others T. B. Aldrich, W. C. Bryant, H. C. Bunner,

Emerson, Hawthorne, Holmes, Longfellow, Lowell, Thoreau, and Whittier; and on October 12, a miscellaneous collection. On October 13 and 14 they sell the collection of the late George Matthews.

The season in Philadelphia begins with the sale by Stan V. Henkels on October 11 and 12 of the library of the late Charles Emory Smith and the unsold portion of the library of W. J. Gilbert of St. Louis.

Correspondence.

DR. S. G. HOWE AND JOHN BROWN'S RAID.

To the Editor of The Nation:

Sir: Your reviewer of the second volume of Dr. S. G. Howe's "Letters and Journals," in your last issue, rightly dwells upon his admirable qualities, his wise philanthropy, and his many services to humanity. But in the matter of Dr. Howe's relation to John Brown the reviewer has not set down the whole story of what happened when, after the Harper's Ferry raid, Dr. Howe represented that he had really had very little to do with John Brown and his plans.

Dr. Howe wrote to Sumner, as your reviewer noted, that it was agreed that all of of John Brown's fellow-conspirators "who were really able to do so should deny all knowledge of the Harper's Ferry plot. *Being in that category*, I published a card which you may have seen in the papers." In this card Dr. Howe said among other things:

Boston, Nov. 14, 1859.

Rumor has mingled my name with the events at Harper's Ferry. So long as it rested on such absurdities as letters written *to* me by Col. Forbes, or others, it was too idle for notice. But when complicity is distinctly charged against me by one of the parties engaged (John E. Cook), my friends beseech me to define my position and I consent the less reluctantly, because I divest myself of what, in time, might be considered an honor, and I want no undeserved ones. As regards Mr. Cook . . . I never saw him . . . never even heard of him until since the outbreak at Harper's Ferry. That event was unforeseen and unexpected of me, nor does all my previous knowledge of John Brown enable me to reconcile it with his characteristic prudence and his reluctance to shed blood, or excite servile insurrection.

How a man, at other times honorable, could have penned this card remains a mystery. Dr. Howe was always cognizant of John Brown's plans, from 1858 on, save only of the exact location of the attack. On February 26, 1858, Mr. Sanborn (see his "Life and Letters of John Brown," pp. 438 and 447) told Dr. Howe everything except that Harper's Ferry was to be the scene. When the raid was postponed from 1858 to 1859 because of threatened treachery, Dr. Howe supported Thomas Wentworth Higginson in urging disregard of all obstacles and an immediate attack, but was finally overruled. In a letter to the *Evening Post* of March 15, 1878, Mr. Sanborn stated that after the postponement he and his fellow-conspirators expected that John Brown would go further west than Harper's Ferry, and added: "In this respect, and in this alone, so far as I know, he changed his plans of 1858, which had been fully explained to Smith, Howe, and Stearns."

But there is another witness than Sanborn—also still living—and an even more damaging one. On seeing Dr Howe's card in print, Thomas Wentworth Higginson wrote to Dr. Howe the following letter (now in the Boston Public Library, and here published for the first time):

Worcester, November 15, 1859.

Dear Sir: I write to you under a sadness very rare for me. Soon after the affair at Harper's Ferry I said to you & Phillips & Sanborn—in allusion to some rumors about you in the papers—that I thought it would be the extreme of baseness in us to deny complicity with Capt. Brown's general scheme—while we were not, of course, called upon to say anything to *criminate* ourselves. I well remember how entirely you disclaimed such intention, & said that we ought to make no statements whatever.

What am I, that I should judge you? But Gerrit Smith's insanity—& your letter—are to me the only two sad results of the whole affair.

I know how skilfully that letter is written. Since language was first invented "to conceal thought" there has been no more skilful combination of words. But the universal interpretation of all intelligent readers, not previously enlightened, *must* be—that you disclaim all knowledge not merely of the precise time & place & opening of John Brown's great drama—but of *the enterprise itself*. That you should deliberately go out of your way to cause this impression to be created is the realization of my worst fears as expressed at your rooms on the day referred to. Would to God, my friend, that I could see the case differently now from what I did then. Do not receive this in anger—it is not written so.

T. W. Higginson.

Dr. S. G. Howe.

This letter, though written, was never sent; but a shorter one of the same import reached Dr. Howe, while to Mr. Sanborn Col. Higginson again declared that Dr. Howe's card was "the extreme of baseness." Mr. Sanborn was not of this opinion, writing: "I don't see why it is any worse to conceal the facts *now* than before the outbreak, *provided* that Brown and his men do not suffer by such concealment. What has been prudence is prudence still and may be for years to come." Dr. Howe's reply to Higginson is dated two months later, February 16th, 1860. It is a pitiful attempt to defend his course. As to the card he says: ." . . I was not very decided in the belief of its expediency. It was done, however, in consequence of an opinion which I held, and hold, that everything which could be honestly done to show that John Brown was not the agent, or even the ally, of others, but an individual acting upon his own responsibility, would increase the chances of escape for him and his companions . . . Of course there were other considerations, but this was the leading one."

He maintains that he had supposed the original plan abandoned, and explains that his sending fifty dollars to Brown shortly before the raid referred "to the promise I had made the year before. It is true that I ought to have expected an explosion and onslaught somewhere; but the fact is that I did not expect anything like what happened, or anything more than a stampede." This was from a member of the small committee to which John Brown owed every arm he carried to Virginia and the money with which he recruited and subsisted his men. Dr. Howe himself contributed not merely $50, but $150. As to the third fifty dollars, he deliberately tried to mislead the Mason Committee of the Senate, as his testimony shows.

Dr. Howe was not the only one who flinched when the exposé took place. His is an unhappy illustration of the fact that the best of men may make grave moral mistakes in great crises, when for a moment their lives and their future appear at stake.

Dobbs Ferry, N. Y., September 24.

SCIENTIFIC HYPOTHESIS.

To the Editor of The Nation:

Sir: The *Nation* of September 2, containing certain questions of mine, which were inspired by an editorial on "Scientific Speculations" in the issue of August 19, together with answers thereto by Prof. Louis T. More, was a week late in coming to my hand. As I am not quite sure that I or other readers of the *Nation* fully understand his replies, I wish to ask Professor More, through the columns of your paper, two further questions:

(1.) When he says, "Few things in human thought have been more misleading and more futile than the discussions of the properties of æther and ætherial waves," what disposition does he make of Maxwell's electro-magnetic theory of light, Hertzian waves, and wireless telegraphy?

(2.) When he says, "One thing physics has taught, that we can never put the 'shapes of ions' to the test of direct experimentation," does he intend to deny that speculations on subjects closely akin to the shapes of ions have, within the last few years, led to conclusions capable of being tested by means of laboratory experiments?

Edwin H. Hall.

Cambridge, Mass., September 12.

To the Editor of The Nation:

Sir: Professor Hall's questions are judiciously chosen and well adapted to make my position clearer.

(1.) Maxwell's electro-magnetic theory of light was based on the assumptions that periodic variation in the electrical charge on matter can be transmitted as a periodic disturbance through an æther, and that this disturbance proceeded with the velocity of light. His theory of light derived from these assumptions was expressed by a set of mathematical equations. No assumptions were made as to the mechanical properties of an æther capable of transmitting such a form of energy or the mechanism by which the particles of luminous matter excited such a disturbance. Hertz and his successors, by devising suitable apparatus, proved that these fundamental assumptions of Maxwell were facts and, to me, at least, these are all that are necessary—the simple and verifiable assumptions and the mathematical laws of Maxwell—to predict and direct all the recent experimental and theoretical advances made in Hertzian waves and wireless telegraphy. That is, the mechanical models which have been imagined for the purpose of illustrating the properties of these waves and of the æther have followed the discovery of the phenomena and have not led to their discovery. If we study, for example, the laws of light in transparent bodies it is, of course, necessary to make certain assumptions, but these should be as simple as possible and verifiable by experiment. This method Maxwell adopts in the case of transparent crystals, when he says:

If we attempt to extend our theory to the case of dense media, we become involved not only in all the ordinary difficulties of mole-

cular theories, but in the deeper mystery of the relation of the molecules to the electromagnetic medium. To evade these difficulties we shall assume that in certain media the specific capacity of electrostatic induction is different in different directions.

This assumption is a question of fact to be decided by experiment and is legitimate and useful. But if Maxwell had further attempted to explain this assumption by imagining certain mechanical devices by which the crystal modified the physical nature of an æther, he would have made a statement unverifiable by experiment and incapable of directing future experiments.

(2.) I can recall no case where a discussion of the shapes of ions has led to the test of direct experimentation. The main results of these discussions, so far as I can see, are the metaphysical doctrines of the existence of electricity as an entity independent of matter and the postulate that mass and matter itself are merely properties of this substance, electricity. Those who think it advisable to assign a shape and size to the ion, in order to render concrete what would otherwise be an abstract idea, are now driven to substitute for matter (our prototype of the concrete) the highly abstract quality, electricity. This they do by assigning the properties hitherto associated with the word *matter* to the word *electricity*.

LOUIS T. MORE.

Cincinnati, O., September 21.

[The *Nation* cannot continue this discussion further.—ED. THE NATION.]

WEIMAR POETRY ON THE HUDSON.

TO THE EDITOR OF THE NATION:

SIR: The sum total of foreign literature about the Hudson River prior to 1840 is probably not very great; least of all would one look to Weimar for meditation on the noble stream. In 1830, however, Frau von Goethe and a number of her friends sought diversion in an amateur publication, designed originally to appear in manuscript, but given to the local printer when it became evident that the many contributors would overtax the *Hofschönschreiber*. There were to be aphorisms, sonnets, stories, and correspondence; and members of the court, together with French and English ladies and gentlemen tarrying at the modest capital, were to supply the copy. This polyglot journal, published every Sunday, was called *Chaos*, and it was agreed never to divulge the writers' names. The circulation of this little quarto was so carefully restricted to actual contributors that copies are to-day very rare and valuable.

The thirty-sixth issue of *Chaos* contains a poem in French entitled, "L'Hudson." It is a composition of twenty or more stanzas, and opens as follows:

L'HUDSON.

Mon pied impatient avait touché la plage;
La brise du matin ridait le flot d'azur;
Le *Steamboat* enfumé s'éloignait du rivage,
Noblement couronné de son panache obscur.

Les golphes de *l'Hudson*, emaillés de cent voiles,
Devant moi de *Catskill* baignait le pied riant;
Sur les faites brisés mouraient quelques étoiles;
Et l'aigle de ses bois volait vers l'Orient.

Sur ce tableau, semblable à la gaze légère,
Une molle vapeur voilait le nouveau jour;
Et l'Indien, savourant la suave atmosphère,
De son Eté natal saluait le retour.*

. . .

Du sol Américain, fleure suave et brillante,
De tes parfums d'amour que j'aime à m'enivrer,
Voyageur, sur ce bord jeté par la tourmente,
Pour moi le vent d'espoir semble ici se lever.

. . .

Là sur le bord boisé d'une immense savane,
Dont un ciel toujours pur éclaire le gazon,
Les mains de son amant bâtiraient sa cabane
Aux rives d'un grand lac, ou d'un fleuve sans nom.

It was, of course, in Goethe's lifetime that these verses made their appearance; and one is at once reminded of the several occasions on which the great prophet turned his gaze toward America—or conceived the plan of eloping thither. One remembers particularly his chat with Sorei, when he told him of the ruse he had adopted to rid himself of a boresome Russian. One of his visitors had sat and gazed at him without saying a word; and Goethe, taking for his text the United States of North America, quoting, perhaps, these very lines, and little heeding the nice distinctions between *Wahrheit* and *Dichtung*, or, as he himself says, between what he knew and what he really didn't know about the Americans, talked his gaping guest still dumber. PERRY WORDEN.

Berlin, September 15.

*L'Eté Indien. On nomme ainsi quelques jours chauds et vaporeux qui en Amérique marquent d'ordinaire le milieu de l'automne.

ANOTHER WORD CONCERNING PROFESSOR SHALER.

TO THE EDITOR OF THE NATION:

SIR: The admirable tribute to Professor Shaler in the *Nation* for September 9 is so suggestive of the man that the writer of this note cannot refrain from adding a few recollections of that most notable personality.

Perhaps the most striking thing about him, after his unexcelled warmth of heart and capacity for making people free of his time and thought and interest, was his surprising industry. On one of the earliest occasions when I was thrown into contact with him and obliged to ask for considerable portions of his time, I remember having asked if he were not over-busy. "No," he replied, "I have a good many things to do, and a score of years ago I had nervous prostration. I went to Germany and tried all kinds of cures for it, but they did no good; so I came home and ever since I've been trying to work it off."

Asking advice from Shaler was a very different thing from seeking it from ordinary sources. On one occasion—apropos of something now quite forgotten—he told the story of his being asked by a graduate of the Harvard Divinity School how he might best fit himself for the work of his chosen calling. The freshly graduated theological student did not feel sure that he knew as much about men as he did about divinity. After a moment's thought, the professor said (in substance): "Go to Colorado, get down into a drift, and dig for two years with the miners; possibly you'll know more about men than you do now." And so the young man did, with the result that he came back at the end of the period suggested to thank his adviser for the good he had derived from following out this most unconventional sort of *Wanderjahre*.

It is quite impossible to convey to any one who never enjoyed the privilege of intimate talks with Shaler an adequate idea of the extraordinary range and vivacity of his conversation. In a single hour he would discuss topics as diverse as national politics, the seeds of fossil *Coniferæ*, and the question whether there might not be some ethnological considerations bearing on mathematical studies, as, for instance, that algebra was not only genetically, but essentially a science for oriental minds. As a story-teller he was unapproachable, and some little incident that in the mouth of the ordinary man would hardly compel the attention of the most courteous listener, would, when told by Shaler loom up with startling vividness. I well remember how he once told me of an adventure with some tufa quarrymen on the west slope of the Posillipo ridge, very near Naples. Nothing startling happened; the rough quarrymen merely crowded tumultuously about the stranger and the cabman who had brought him marveled that they had not robbed him. But the story was told with such spirit that one could see the faces of the rough fellows standing out with all the vigor of Salvatore Rosa's well-known Heads of Brigands.

Every one at all familiar with the opinion in academic circles in Cambridge knows that it has for years been much the fashion to speak of Professor Shaler's work in a patronizing, or less than patronizing, manner. And it may be readily granted that, whether from different original endowment or from lack of time in the midst of most engrossing cares of many kinds, he did not attempt the work of a Dana, a Geikie, or a Chamberlain. But in these days of all-absorbing specialization it is often the hardest task of any to find a rounded, big-brained man who can call out and foster in his students all of their potential best. This is just what Shaler did as hardly any man of his generation in all New England could do it. JOSEPH Y. BERGEN.

Cambridge, Mass., September 18.

SCIENCE AND THE LOVE OF NATURE.

TO THE EDITOR OF THE NATION:

SIR: The writer of the letter entitled, "Nature and Science" (the *Nation*, September 9) thinks it "singular that the love of natural scenery should be almost coeval with the age of modern science." His reasons are the expressions of terror and disgust he finds in the writings of early travellers and settlers on the Atlantic seaboard, and a corresponding attitude toward nature among English writers. But might not Jefferson's epithet "terrible," which be applied to "the romantic pass of Harper's Ferry," indicate appreciation of the grandeur of this scenery, and likewise Josselyn's characterization of the White Mountains as "daunting terrible"? And when the English guide book to the Lake Country, in 1774, speaks of "the most horrid romantic mountains," is this not a description of the "bristling" forests? It is certain that Henry Hudson was charmed with the scenery along the banks of his river, of which he wrote that "it was as fair a land as can be trodden by the foot of man." Alexander von Humboldt ("Cosmos," II, p. 66, in Otté's translation) tells of the "depth of feeling for nature" with which Columbus was endowed and quotes the following:

Once I came to a deeply inclosed harbor, and saw a high mountain that had never been seen by any mortal eye, and from whence gentle waters (lindas aguas) flowed down. The mountain was covered with firs and variously-formed trees adorned with beautiful blossoms. . . . I felt as if I could never leave so charming a spot.

One might be inclined to ascribe to Columbus the spirit of "modern science;" but this is out of the question in the case of a writer who lived in the fourth century A. D. Basil the Great wrote the following description of some Asia Minor scenery in a letter to his friend Gregory Nazianzen:

God has suffered me to find a place, such as has often flitted before our imaginations . . . A high mountain, clothed with thick woods, is watered to the north by fresh and ever-flowing streams. At its foot lies an extended plain, rendered fruitful by the vapors, with which it is moistened. The surrounding forest, crowded with trees of different kinds, incloses me as in a strong fortress. This wilderness is bounded by two deep ravines; on the one side, the river, rushing in foam down the mountain, forms an almost impassable barrier, while on the other all access is impeded by a broad mountain ridge. My hut is so situated on the summit of the mountain that I can overlook the whole plain, and follow throughout its course the Iris, which is more beautiful, and has a more abundant body of water, than the Strymon near Amphipolis. The river of my wilderness, which is more impetuous than any other that I know of, breaks against the jutting rock, and throws itself foaming into the abyss below: an object of admiration to the mountain wanderer.

Humboldt remarks on this passage ("Cosmos," II, p. 41) that it expresses feelings "more intimately in unison with those of modern times than anything that has been transmitted to us from Greek or Roman antiquity"; at the same time, he has shown that the classical literatures also manifest a deep love of nature's beauty. It is certainly wrong to regard "the old Virgilian conception of 'shaggy,' 'bristling,' and 'horrid' woods, and crags, and mountains" as representing the ancient attitude towards nature, and to place this in sharp contrast with modern feeling. No single writer can represent the whole of ancient literature, nor can love of natural scenery be denied to Virgil himself. His description, for example, of Æneas's boat, on its passage up the Tiber ("Æneid," vii), rounding the bends of the river, gliding under overhanging trees, and cleaving the green forest reflected beneath, is in the most romantic vein. No doubt there has been a change in the sentimental attitude toward nature, yet this has been determined by a variety of causes besides modern science. Humboldt has shown this in his widely extended study of the reflection of nature in the feelings of mankind. The 104th psalm, according to him, might almost be said to represent "the image of the whole Cosmos."

FURLONG AND ACRE.

TO THE EDITOR OF THE NATION:

SIR: The writer of the letter in the *Nation* of September 16 on "Square Measure," who asks for an explanation of the peculiar size of the acre, may be interested in the following extract from page 3 of W. H. R. Curtler's "Short History of English Agriculture" (Clarendon Press, 1909):

The size of the strips in the arable fields [in Anglo-Saxon times] varied, but was generally an acre, in most places a furlong (furrow long) or 220 yards in length, and 22 yards broad; or, in other words, 40 rods of 5½ yards in length and 4 in breadth. There was, however, little uniformity in measurement before the Norman Conquest, the rod by which the furlongs and acres were measured varying in length from 12 to 24 feet, so that one acre might be four times as large as another. [Maitland, "Domesday Book and Beyond," p. 368.] The acre was, roughly speaking, the amount that a team could plough in a day, and seems to have been from earliest times the unit of measuring the area of land. Of necessity the real acre and the ideal acre were also different, for the reason that the former had to contend with the inequalities of the earth's surface and varied much when no scientific measurement was possible. As late as 1820 the acre was in Bedfordshire 2 roods, in Dorset 134 perches instead of 160, in Lincolnshire 5 roods, in Staffordshire 2¼ acres. To-day the Cheshire acre is 10,240 square yards. As, however, an acre was and is a day's ploughing for a team, we may assume that the most usual acre was the same area then as now. The strips were divided from one another by narrow grass paths generally called "balks," and at the end of a group of these strips was the "headland" where the plough turned, the name being common to-day. Z. CHAFEE, JR.

Providence, R. I., September 17.

PERSONALITY.

TO THE EDITOR OF THE NATION:

SIR: Another object lesson in the power of personality, strong enough, seemingly, to reach the most obdurate. We may assume for the purpose of present argument that the claims are correctly given on both sides. Commander Peary will receive honors and compliments, but with a well-equipped and manned expedition he must share the glory with his officers and men, and behind them the government, of which he is an officer on leave. It is largely official.

What was needed to give the greatest fruition and effect was, that one man with inadequate resources, and relying only on his own courage and convictions, should go straight to the desired point and, having secured his evidence, return through manifold and almost certain chances of death by starvation, averted only by what the Israelites called manna in the wilderness. Has there been anything in history, with the possible exception of the first Crusades, to equal the frenzied outbursts of enthusiasm which greeted the return of Dr. Cook? There may not be much exaggeration in saying that by drawing and knitting together human sympathy and admiration it has done more than any impersonal peace conference, under the auspices of Imperial potentates, to mitigate the miserable calamities of international war.

Will our people ever learn the lesson, before it is too late, that they will have to submit to this force of personality at the bidding of democracy whether they like it or not, and that their only chance of salvation is to make it work for good and not for evil? In their dread and distrust of universal suffrage, the educated and conservative classes try to deceive and defeat it by all sorts of devices, committees, and commissions, long terms of office, renewal by fractions, direct nominations, recall and referendum, proportional representation, and so on; forgetting that no chain is stronger than its weakest link, and no stream can rise higher than its source. All these expedients go to pieces on the same rock, the effort to suppress personality, which will not be suppressed, but if it gains strength by delay and opposition will burst out in volcanic and devastating violence.

The only way to meet this is to cultivate personality instead of trying to suppress it; to concentrate power and offset it by public responsibility. The recent Democratic convention at Saratoga issued a platform of fifteen articles, describing certain things necessary to do, but without a suggestion as to how or by whom they are to be done—except by "the party" in general terms. They leave that to the Republicans, and the extra session of five months shows to what degree of success they have attained. There were men at Saratoga who could testify from their own experience that great things are not done in this world in that way.

G. BRADFORD.

Boston, September 23.

RAILWAY STATIONS VERSUS ART.

TO THE EDITOR OF THE NATION:

SIR: In connection with your recent article on "Art and Railway Stations" (September 16), it may be of interest to recall a passage in Mr. G. K. Chesterton's "Essay on George Frederick Watts." On page 52 we read as follows:

He [Watts] ought to be employed to paint factory chimneys and railway stations. I know that this will sound like insolence; my only answer is that he . . . actually offered to paint a railway station. With a splendid and truly religious imagination, he asked permission to decorate Euston. The railway managers (not perceiving in their dull classical routine the wild poetry of their station) declined.

But we must remember that this happened "a few years ago" in England, and *not* in romantic America. G. C. SCOGGIN.

Literature.

THE FOUNDER OF GERMANTOWN.

The Life of Francis Daniel Pastorius, the Founder of Germantown. Illustrated with 90 photographic reproductions. By Marion Dexter Learned, Ph.D., L.H.D., Professor of German in the University of Pennsylvania. With an Appreciation of Pastorius by Samuel Whitaker Pennypacker, LL.D., former Governor of Pennsylvania. Philadelphia: William J. Campbell. $5 net.

It was reported by cablegram that the German Emperor had accepted a presentation copy of Professor Learned's "Life of Pastorius," in which he had shown especial interest. This interest is not to be wondered at; for the book, in a considerable part of its contents, traverses the German Fatherland at an important period of its history. As the author indicates in his preface, this is, in truth, as it was designed to be, "a *documentary* life of Pastorius." It brings the reader in touch with the original sources of his life history as uncovered from the archives of Europe and America, and especially of Germany. Undoubtedly this feature adds to the historic value of the work, but

makes it rather difficult reading to the average English reader, who has not a facile command of Latin and German Apart from this, the author's style is clear, and at times even animated. In parts of his work it flows on with fewer "documentary" interruptions. As a valuable contribution to the original sources of the biography of one of the most important characters in the settlement of the American colonies, Professor Learned's "Life of Pastorius" takes a peculiar place, and deserves high praise.

Pastorius was born in Sommerhausen, Franconia, September 26, 1651, three years after the close of the Thirty Years' War, of a distinguished German family, whose history "reflects the vicissitudes of the fierce religious strife of the times of Gustavus Adolphus, Tilly and Wallenstein." Thus, by birth and home breeding, and those intangible but potent influences that local and historic environments so often exert, he was moulded for useful leadership. An academic course in the Gymnasium of the ancient imperial city of Windsheim was followed by a period at the University of Altdorf. Thence, after the fashion of the day, he attended lectures in the Universities of Strassburg, Jena, and Basle, devoting himself especially to the study of jurisprudence. He returned to Altdorf, where he took his diploma, and soon after set up as a practising lawyer in Windsheim. By this training he acquired not only knowledge of his chosen profession, but became a good classical scholar, and mastered French, Italian, Dutch, Spanish, and English. The colonies had no abler scholar than him, nor any of wider culture when at last he landed in Philadelphia. He was then thirty-two years old, in the very prime of his young manhood.

The purpose of his emigration was twofold: He wished to find for himself and his descendants a refuge from the prevailing worldly "vanities" and engrossing pursuit of pleasures that possessed the gentry of his native land and of Europe. His pietist and quietist tendencies were here in the ascendant. But he was also impelled by a strong "missionary" sentiment, as we should perhaps now express it. This appears from his own testimony (Life, p. 104):

> I reasoned thus with myself, whether it were not better to teach the learning which I had received by Grace from the highest Giver and Father of Lights to the new-found American peoples of Pennsylvania, and thus make them partakers of the true knowledge of the Holy Trinity and true Christianity.

In his quietistic tendencies, Pastorius was doubtless much influenced by contact with his friend, the Rev. Dr. Horb, and through him with Dr. Spener and his group of Frankfurt pietists. But Prof. Learned concludes that his views were the "result of long years of quest for the truth"; and that he was not so much a product of mature pietism as, "like Spener himself, an exponent of the great religious awakening of the second half of the seventeenth century, the mature fruit of the labors of Tauler, Luther, and Arnd." However that may be, it was undoubtedly a visit of Wm. Penn and his Quaker companions to Frankfurt (1677) that turned the mind of Pastorius toward colonization in the New World. He accepted the agency of a German land company that had purchased 25,000 acres from Wm. Penn in his new colony, and after a voyage of great hardships arrived in Philadelphia with a small miscellaneous company of adventurers, August 20, 1683. He at once began his labors for the Frankfurt principals, and found it anything but plain sailing. Penn's understanding of the terms of sale was not satisfactory, although that was finally adjusted. But more serious complications of a legal character tended to increase his ill opinion of the law as a profession, which he declared to be a game at another's expense ("Ein *lusus de alieno corio*"). It is to be hoped that the traditional, proverbial reputation of the "Philadelphia lawyer" for astuteness was not earned by such sharp practices as Pastorius was called upon to encounter, and which greatly shocked his high ideal of professional propriety (see p. 225).

The work of founding Germantown—now a large and semi-rural residential part of Philadelphia—and of looking after the interests of his German clients, occupied much of his time. But he soon entered upon that particular phase of his "mission" which had moved him to come to America. He established a school, largely under the patronage of the Society of Friends, with whom he continued in close association during all his life. His work as schoolmaster held on almost to the end of his career. It was this intimacy with the Philadelphia Quakers that appears to have moved him to make to them the famous "protest against slavery" sent to the Friends' Meeting of 1688. This, though signed by three other persons besides himself, is in his handwriting and bears internal evidence of his authorship. It was not received with enthusiasm, but with respect, and was referred first to Monthly, and then to Quarterly, and then to Yearly Meeting. It was a subject that Friends were not quite prepared to "meddle with," or to "give a Positive Judgment in the Case, it having so General a Relation to many other Parts, and therefore at present, they forbear it." Yet this was the beginning of the great agitation that convulsed the Continent and issued nearly two centuries later in Abraham Lincoln's Proclamation of Emancipation. Pastorius and his German associates were in advance even of the Friends in their hostility to negro slavery; but their "Protest" in the little Quaker meeting house soon became the real voice of their Society. One sees how Whittier, "the Quaker poet," during his residence in Philadelphia, received the impulse that led to his idyl on Pastorius—"The Pennsylvania Pilgrim."

A striking peculiarity of this interesting character, which Professor Learned fully exhibits, is his composition of manuscript books. One of these, "The Bee Hive," composed (ostensibly) for the writer's two sons, is illustrated in photogravure. Pastorius died—the exact date is not known—near the close of 1719, being sixty-eight years old, and was buried in an unknown grave, presumably in the little Germantown Friends' burying ground.

CURRENT FICTION.

Open Country. By Maurice Hewlett. New York: Charles Scribner's Sons.

The John Senhouse of this broken idyl, the writer of the letters which chiefly record it, is he of "Halfway House," but in a slightly earlier phase. He stands for a favorite figure in current English fiction—the man of comfortable birth who revolts against the conventions of his up-bringing, and discards the accessories with which fortune has hampered him. He reaped the intellectual harvest of Cambridge life, but would not try for a degree, and strolled away one morning, without impedimenta, from college and conventional life, never to return. Thereafter he became a "gentleman gipsy," a theoretical anarchist, a roving painter, author, and botanist. He had not, it is to be noted, the disadvantages of the outcast. He chose to live in a tent, and to dress in a pair of flannel trousers and a sweater, at an expense of a few shillings a week, which he earned himself. But the ameliorating fact always remained in the background that he was the son of a rich father, who stood ready at any moment to restore a lapsed allowance, and was sure some day to turn over a fortune to the harmless prodigal. In consequence, society always remained open to him, chose to consider him as amusing and eccentric instead of reprehensible. We behold him therefore from time to time, juxtaposing his inseparable sweater (would not a blazer have done?) to the white shoulders and shirt-fronts of a tolerant elect. When he likes, he may pitch his tent upon some lordly park or lawn. The fact is, he has the advantages without the responsibilities of his position.

He meets a maid in the forest, and an opening scene of rather preposterous unconventionality leads to an intimacy which the pair agree to call friendship. Presently Senhouse finds himself loving the girl as far as it is in him to love a woman. It is the vague eloquent

Boston Public Library

emotion of a poet tinged, but not dominated, by the passion of a man. She is his Beatrice—his Artemis—anything but his woman to win and keep. Her own heart is touched by no feeling beyond affection, for the simple reason that he makes no attempt to arouse anything beyond it. In consequence, it is not long before she is appropriated by another man; whereupon Senhouse undergoes a certain amount of suffering. But he is after all merely one of your self-centred lovers of mankind. There is a moment which brings him almost to the point of regret that his attitude toward his Sanchia has not been that of an ordinary man. But he does not believe in marriage; and his punishment lies in the necessity of marrying Sanchia to the other man, for her own sake. He does not think himself worthy of her, yet is brought to desire her conventional union with a man who is greatly less worthy, and who has stepped into the place in Sanchia's heart which he himself has deliberately left empty.

The story is largely told in the form of letters which will be recognized as having been recently published in an American magazine, under the title "Letters to Sanchia." The performance as a whole hardly shows Mr. Hewlett at his best. Here more clearly than ever his ingenuousness is seen to be ingenuity. Senhouse is as unreal a figure as the Skionar or Forester of a Peacock, and the narrative in which he appears has by no means the satirical dignity of a "Crotchet Castle" or a "Gryll Grange."

Melchisedec. By Ramsey Benson. New York: Henry Holt & Co.

The writer of this story has unmistakably something to say, but delivers his message with an unfortunate superabundance of violent gesture and expletive. The message itself is far from new, but perennially interesting as all attempts at the unattainable must ever be. The theme of the non-sectarian and dogmaless priest, after the order of Melchisedec, who embodies in modern form the author's idea of the Christ-spirit, has become familiar. Even among the most fervent admirers of such books as "A Singular Life," "The Servant in the House," and "Il Santo" (without the last-named we doubt if "Melchisedec" would have been written), it is an open question whether this subject can ever be satisfactorily presented; there is scarcely room for question that Mr. Benson, at least, has failed in his major purpose, though he has given us a psychological study of no mean interest. The play of heredity in his half-breed hero is much in the line of present thought, and the gradual awakening of the religious nature of the young savage is finely portrayed. His pathetic disappointment in the church of his adoption, which drives him back to the kindly old French doctor, is artistically the end of the story. From that point the writer, evidently in the attempt to represent adequately the earthly side of his hero, falls into grievous sins of taste, and the last book drags its slow length along in puerile anticlimax that would be less offensive than dull, were it not for the insistent dwelling on the resemblance aforesaid. This book is a crying example of the tendency of the writer of the day to fall more and more under the spell of an inertia which holds pen to paper after the actual story is finished.

Zandric. By Marian Edwards Richards. New York: The Century Co.

This is a love story pure and simple, in the fullest sense of the words; there is simplicity in its very extravagances, and Zandrie's almost superhuman innocence is not only credible, but entirely convincing. An impulsive, intense child, convent-bred, she finds her ideal knight in Julian Furness, flung from his horse at the convent doors. Julian is crippled for life, and Zandrie finds no joy in the world save that of being his companion and servitor. The book is simply the narrative of her struggle to this end, against the allied forces of Mrs. Grundy, the treacherous machinations of Julian's jealous mother and Zandrie's other lover, and—most potent obstacle of all—Julian's own sense of right, which forbids him to weight his little sweetheart's destiny with the burden of his own maimed life. Of course, true love triumphs at last, after the author has luxuriously heaped Pelion of misery upon Ossa, and proved her hero in furnaces of affliction heated to a degree hardly possible for any but the ardent heart of youth to conceive. In the entire treatment of the theme there is a morning freshness that sorts well with the callow years of the protagonists; and even the Depraved Mother provokes hardly more than an indulgent smile—she is so like the Wicked Queen of the fairy-tales, for whose naïve villainy the red-hot iron shoes always seem too cruel a punishment.

The End of the Road. By Stanley Portal Hyatt. New York: D. Appleton & Co.

This story, though rather higgledy-piggledy as a novel, gives a really interesting picture of South African conditions before and since the Boer war. The hero is a transport rider who knows and loves his road, his bullocks, his Basutu driver, his Kaffir neighbors. Going out from England as a mining engineer, he soon yields to the call of the road, and becomes one of the brotherhood who love the "journey-which-always-goes-on." To these pioneers the railway is a commercial intruder, civilization a baleful necessity. Yet a chance meeting with a married white woman in the wilds rouses questions as to the white man's destiny; and when this meeting is followed by another with an unattached Englishwoman, the conflict begins between the Road and the Girl. All ends naturally, but not until the war has come and gone; not until the railway has made obsolete the transport rider; not until the places that knew the spoor of the antelope and the clamor of Guinea fowl, know them no more; nor until even the hero has reluctantly accepted the universe as one that must move.

TWO ESSAYISTS.

The Shadow on the Dial. By Ambrose Bierce. San Francisco: A. M. Robertson. $2 net.

Causes and Consequences; Practical Agitation; Emerson and other Essays. By John Jay Chapman. New York: Moffat, Yard & Co. $1.25 each.

It has been said that the attention of the apathetic reader of to-day cannot be roused by charming him or amusing him or even shocking him—you must irritate him. Mr. Bierce and Mr. Chapman have both adopted this principle. If Mr. Bierce's acerbity is more flamboyant and luxuriant in growth, as befits a product of the Pacific slope, Mr. Chapman's more insinuating tendrils are better adapted for blistering the cuticle of the longitude of New York. A good many years ago Mr. Bierce published a book of short stories entitled "In the Midst of Life," dealing almost altogether with events of the civil war. These stories, too little known, are excellent. They are well-imagined and are told with a reserve and a directness that make straight for the reader's nerves. It is discouraging to note in the present volume the fatal effect of a lifetime of journalism on a fine talent. It is true that this volume appears to consist of articles insufficiently esteemed by the author for inclusion in the ten volumes of his works which are shortly to be published. But as far as it goes, it shows that Mr. Bierce now forces the note, talks about matters he does not perfectly understand, says habitually more than he means, counts that sentence lost which contains no paradox, and contradicts himself without a blush. But his power of phrasing abides; a debating society could be kept busy by the suggestions in the following dicta:

In freeing us from the monarchical chain, the coalition of European Powers commonly known in American history as "the valor of our forefathers" stripped us starker than they knew.

International arbitration may be defined as the substitution of many burning questions for a smouldering one.

All languages are spoken in Hell, but chiefly those of Southeastern Europe.

Mr. Bierce contends that the shadow on the dial of civilization is going back, and finds that "the men and women of 'principle' are a pretty dangerous class, generally speaking—and they are generally speaking." Mr. Chapman, on the other hand, believes that we get on in the long run in proportion as we stick to "principles." But whether the shadow is waxing or waning, our authors agree that this is a dark hour. Mr. Bierce thinks that democracy is intrinsically bad; Mr. Chapman thinks that it has only accidentally been a failure up to the present time. He analyzes its bad effect on our collective character, the opportunity it has given for corruption, and its share in producing the famous American "timidity." We cannot afford to think clearly or speak boldly on any subject, for we may suffer pecuniarily or socially if we disagree with our neighbors; "a civilization based upon a commerce which is in all its parts corruptly managed will present a social life which is unintelligent and mediocre, made up of people afraid of each other, whose ideas are shopworn, whose manners are self-conscious." "Here at last we have the great characteristic which covers our continent like a climate—intellectual dishonesty." Mr. Bierce rejects republican government on the ground that it does not govern. Mr. Chapman admits that it does not govern, but contends that we should forego the pleasure of being governed for the profit of being educated. But by his own showing, our institutions give us the same education that Fagin gave Oliver Twist. Mr. Chapman's hope for the future is grounded on the revival of courage, but the virtue that has been atrophying under democracy will become otiose as collectivism progresses. The forces which are making us constantly more timid and more alike are still far from having their perfect work.

Mr. Chapman turns for relief from politics to art. The artist is the altruist: in proportion as his work is good it is unselfish. "The Elgin marbles and a decision of John Marshall are valued for the same reason. What we feel in them is a painstaking submission to facts beyond the author's control." Art may go altogether under democracy, but as long as it exists it will be the protest of the individual, at all costs, against the tyranny of the majority. Mr. Chapman's literary essays have a double-barrelled interest; they are keen, witty, and impartial critical judgments, and they are corollaries of his theory of life. He values Emerson highly as an enemy of organization, for where even two or three are gathered together concessions are made and the wings of "principle" are clipped. But he is able to see Emerson's incompleteness. He is "a Shelley, and yet a sort of Yankee Shelley, who is mad only when the wind is nor' nor' west." "If an inhabitant of another planet should visit the earth, he would receive, on the whole, a truer notion of human life by attending an Italian opera than he would by reading Emerson's volumes. He would learn from the Italian opera that there were two sexes; and this, after all, is probably the fact with which the education of such a stranger ought to begin." The reader who has enjoyed Mr. Chapman on Emerson will want to know what he has to say of Browning, of Walt Whitman, and of Stevenson. And in no case will he be disappointed.

The essays that make up Mr. Chapman's three volumes have all appeared in print before, some, at any rate, in the magazines, although no formal attribution is made except in the case of the "Emerson," which was published originally in the *Atlantic Monthly*. All have been revised and may, therefore, be considered as representing the author's matured views, but there is no notice of material alteration.

The Latins in the Levant: A History of Frankish Greece (1204-1566). By William Miller. New York: E. P. Dutton & Co. $5 net.

We have not had heretofore a complete history of the Latin principalities in the Levant. Nor have we one now; for Mr. Miller has left out of his book the states in Crete, Cyprus, Syria, and Jerusalem, while the Latin empire on the Bosporus receives only incidental notice. On the other hand, he has recounted in great detail the strange deeds of the Flemish, French, Italian, and Spanish adventurers who in the long and troubled interval between the capture of Constantinople and the completion of the Turkish conquest of the Morea held in precarious possession the chief places of what is now modern Greece.

As a book of reference Mr. Miller's work has a value which will not be soon impaired. It contains the substance of what has been known about the period, and, in addition, countless corrections and extensions, as well as many new determinations of chronological, topographical, and genealogical relations. Nor does it fail altogether in general effect. By the very weight of its innumerable incidents it impresses the character of the age upon our imagination. It was a world of vast and incurable disorder, which is inherent, perhaps, in every feudal system, but which was aggravated in this case by special complications. There was the conflict with *two* ecclesiastical systems, the lack of national unity among the barons, the neglect of the Salic law with the consequent strife for heiresses and widows and the consequent need for women to do the work of strong men; there was, at times, the awkwardness of a dual or triple allegiance to lords mostly non-resident and absorbed by more pressing cares; there was the disheartening discovery, made in the battles of Pelagonia (1259) and Kephissos (1311), that massed infantry was superior to mounted knights. This discovery the Latin nobles could not utilize; so that their adversaries, more fortunate in this respect, became the exponents in the East of military progress. Thus Catalans, Navarrese, Albanians, and Janissaries were able to destroy the Latin principalities.

We believe that some readers will be interested in the careers of a few of the five or six hundred personages who crowd Mr. Miller's pages. The Villehardouins and the Acciajuoli win our attention by the magnitude of their work, the women by their romantic marriages and their unromantic remarriages, the Greeks by their misfortunes and crimes. But the figures in the long procession are so indistinct and succeed one another so rapidly that in the end the eyes of the most zealous reader wander. We predict that few will read all of the book, none all with pleasure. The historical student is not tempted far into it by the blazing of trails which he may have been following in earlier mediæval, Byzantine, or Turkish history. Mr. Miller has detached his province too much from its environment. His treatment is too episodic; his interpretation too impressionistic. And while he has done his whole duty in the matter of travel, documentation, and study, and has visited "all the chief castles and sites of the Frankish period," ransacked the archives of Venice, Naples, Palermo, and Barcelona—"the great cemeteries of mediæval Greece"—and has consulted all the printed books known to him "in Greek, Italian, Spanish, French, German, English, and Latin, which deal in any way with the subject," he has not given the reader any estimate of the value of the sources, he has not arranged his bibliography with any care, and he has incorporated into his text much matter which should have been relegated to the notes or omitted altogether. "The Latins in the Levant" is the work of an indefatigable traveller and antiquarian. As a collection of materials it is highly valuable; but it is also another striking evidence of the truth of the *dictum* that knowledge and industry do not suffice to make an historian.

The Claims of French Poetry. Nine Studies in the Greater French Poets. By John C. Bailey. New York: Mitchell Kennerley. $2.50 net.

In spite of certain conspicuous merits, Mr. Bailey's volume does not wholly satisfy the expectations which it raises. The introduction, if not the title, would lead one to look for a kind of essay in comparative literature to determine, on something like general principles, the

relative merits of French and English poetry. And it is in accordance with this implicit promise that Mr. Bailey begins his serious business of criticism with a paper on "English Taste and French Drama," meaning thereby the drama of the seventeenth century. His point of view in this article, as in the whole course of his volume for that matter, is frankly English; his object in this instance is to justify the common insular prejudice against Corneille and particularly Racine, whom he triumphantly finds inferior, not only to Dante, Shakespeare, and the Greek tragedians, but in some respects to a number of romantic poets. His attitude is calm and judicial, he realizes that the unfortunates are on trial for their lives, and what he says is all true enough in itself; his rating is in some sort justified. But this kind of discussion is one which no lover of Racine will much enjoy; for, after all, such rating, whether justified or not, misses the point; and it is impossible to read this chapter, good as it is in parts, without feeling that the writer has never wholly got into his Racine.

In so far, however, the book may be said to fulfil its pretensions; it is an examination of the claims of French poetry. But the remaining essays are hardly other than papers of the ordinary appreciative character; each attempts to exhibit what is distinctive of some one French poet; for in spite of his relatively adverse judgment, the writer still believes that there is much in French verse which the lover of poetry cannot afford to neglect. At the same time, its type, on the whole, is that of Horace: it is "the broad way across the plain of life, not the difficult paths over the mountains."

With this idea in mind—and some further notion, perhaps, of exemplifying the exceptions as well as the rule—he considers severally Marot, Ronsard, La Fontaine, André Chénier, Hugo, Leconte de Lisle, and Heredia. These pieces are acute and interesting, and particularly well illustrated by copious quotations. Marot is "the most natural of poets." "The charm of Ronsard lies" in "the effect as of 'something rich and strange'" and "the graceful play of fancy." La Fontaine is, with Molière, "one of the greatest pleasure-givers of all times and all countries." Chénier has "a political fervor which makes us think of Shelley, and an artistic insight into the beauty of Greek mythology which is a foretaste of Keats." Hugo is "a kind of spokesman of humanity, and in particular . . . he more than any one else is the poetic voice of the nineteenth century." "The dominant note of Leconte de Lisle [is] a kind of intellectual and artistic quietism," while the main characteristic of Heredia seems to be "an air of unique distinction."

Such are, in brief, the claims of these poets upon our attention, as the writer sees them. Some of his confrontations are a little curious; yet every now and then he works out a suggestive parallel—as between Leconte de Lisle and Matthew Arnold. But his list itself is the most significant thing in the book. Upon this roll of "greater French poets" there does not figure a single prominent classic. They are all virtually disposed of in the essay on "English Taste." Evidently, Mr. Bailey is modern and romantic; and the fact explains sufficiently perhaps his reservations toward Racine and Boileau, and even Malherbe, and his expansiveness toward Marot and Ronsard, as well as Molière and La Fontaine, whom he excepts from the other writers of their period.

Notes.

In November Constable & Co. will begin the publication of an illustrated edition of the works of George Meredith, in about twenty-six volumes, to be sold in sets only. One volume will comprise the uncompleted novel, "Celt and Saxon," and there will be other unpublished matter, including an incomplete romance and a comedy. A bibliography will appear in a final volume.

Fleming H. Revell Company announces for publication on October 2 "The Immigrant Tide: Its Ebb and Flow," by Edward A. Steiner, and "Court Life in China: The Capital; its Officials and People," by I. T. Headland.

Dr. Johnson's bicentenary is to be commemorated by the reissue of Boswell's "Life" in two volumes, edited by Roger Ingpen, and with six hundred illustrations (Sturgis & Walton Co.).

"Roman Cities of Northern Italy and Dalmatia," by A. L. Frothingham, is among the autumn publications of the Sturgis & Walton Co., and "The Roman Assemblies from Their Origin to the End of the Republic," by Prof. George Willis Botsford, is on the Macmillans' list.

The Macmillan Co. announces two college text-books of considerable importance in Prof. Louis Kahlenberg's "Outlines of Chemistry" and the "Representative Biographies" of C. T. Copeland and F. W. C. Hersey.

Among the new books on the list of Sherman, French & Co. are: "Selections from the Writings of Sir Walter Raleigh," edited by F. W. C. Hersey; "Religion and the Modern Mind," by Frank Carleton Doan, of the Meadville Theological School, and "The Prison Ships and Other Poems," by Thomas Walsh.

Notable among the autumn publications of Henry Frowde are editions of Campion's "Complete Works," edited by P. Vivian; Spenser's "Poetical Works," vols. II and III, edited by J. C. Smith, and the Marquis of Halifax's "Complete Works," edited by W. A. Raleigh—all three in the Oxford English Texts; Marlowe's "Works," a popular edition in one volume, edited by C. F. Tucker Brooke; "The Dublin Book of Irish Verse," edited by J. Cooke, and, in the Oxford Library of Prose and Poetry, "Shelley's Literary and Philosophical Criticism," edited by J. Shawcross.

Two more books on Africa are announced: "Snapshots from Sunny Africa," by Helen E. Springer (Fleming H. Revell Co.), and Peter MacQueen's "In Wildest Africa," illustrated by Peter Dutkewich (L. C. Page & Co.).

In "The Picturesque Hudson" (The Macmillan Co.) Clifton Johnson gives a pleasant and timely description of the river. "To a very large degree," he says, "the peculiar sentiment and romance that are associated with the Hudson are due to Washington Irving. The river may almost be said to have been discovered by him. . . . Whether he was writing fiction or simply interpreting fact, in either case his lively imagination and gentle humor imparted an atmosphere that will always color the public impression of the region." To Irving's fables, which he quotes liberally, the author has added touches of local color gleaned from talks with fishermen and "old settlers" who still take their living from the river. Historical events and associations are recorded, and the scenery is described without too many superlatives. The illustrations, some forty in number, from photographs taken by Mr. Johnson, are marked by their individuality.

As a descendant of Robert Fulton, Mrs. Alice Crary Sutcliffe ("Robert Fulton and the Clermont," the Century Co.) has had access to family documents which were not available to previous biographers of the inventor, and these throw additional light on his efforts and achievements. Not the least interesting of these papers is Fulton's hitherto unpublished recital of the experiments in France with his plunging boat and with his torpedo, or bomb submarine. From the inventor's point of view both were practicable. "He openly demonstrated the principles of his inventions," says Mrs. Sutcliffe, "and vainly offered them to the French government. If Napoleon had been favorable to them, the history of Europe might have changed. But Napoleon's scientific counsellors pronounced Fulton 'a visionary' and his invention 'a mad scheme.'" The French judgment of the man was a "simple absurdity." Every detail of his inventions was set down in figures, drawings, and models; moreover, he had always in view the advantages humanity would receive from the products of his genius. That point the author drives home. Fulton's predictions regarding the benefits of canal systems—a subject near to his heart—have been borne out by the development of navigation in this and other countries. As he wrote to George Washington:

> The discovery of the mariner's compass gave commerce to the world. The invention of printing is dissipating darkness and giving a polish to the mass of men. And the introduction of the creative system of canals as certain in their effects will give an agricultural polish to every acre of America.

Thus it is not a mistake to characterize Fulton as a reformer who was "deeply interested in the largest problems of humanity." A valuable addition to the book is the list of Fulton's paintings and miniatures, several of which are in the hands of American collectors.

What art has joined together, science has attempted to put asunder. In "The

Collaboration of Webster and Dekker," a dissertation by Frederick Erastus Pierce, published as Vol. XXXVII of the Yale Studies in English. Since Fleay's unsupported attribution of the greater part of "Westward Ho" and "Northward Ho" to Webster, the best critical opinion has been steadily shifting to the opposite ground. In a study of Webster which appeared in 1905, Prof. E. E. Stoll argued pretty conclusively that all literary tests pointed to Dekker as the principal author of the two plays. By a systematic application of the various familiar processes, Mr. Pierce endeavors to reduce uncertainty about these two plays and "Sir Thomas Wyatt" to the lowest terms. In so far as he uses the "parallel passage," the "metrical," the "incident," the "character," and "atmosphere" tests his procedure, though clear and methodical, is not original, nor in its results much more than corroborative; he concludes that the share of Webster in the citizen-comedies was very small, and that he wrote about a third of "Sir Thomas Wyatt." The dissertation tends as a whole to strengthen our conviction that the earlier students of the drama generally failed to do justice to the abundance and fertility of Dekker's genius.

But the most interesting part of Mr. Pierce's work is an entirely new test for the discrimination of authorship—a test almost as impartial as mathematics and yielding results as easily tabulated. Observing off-hand a marked difference between Webster and Dekker in the use of polysyllables of classical derivation, Mr. Pierce devised a method of comparison, as follows:

> The first thing to do . . . is to reduce the whole scene in question to solid prose lines; that is, to find how many lines it would contain if it were printed as one solid block of prose, without breaks at the ends of metrical lines, without gaps between speeches, and without stage directions. Then the whole number of three-syllable words (of Greek or Latin derivation) divided by the number of solid prose lines, equals the ratio of these words to a line. For instance, if a scene contains 100 solid lines and 22 of the aforementioned words, its word-average would be .220. If the length of the prose line, which is the standard of measure, is carefully kept the same, this gives the fairest and most accurate kind of test.

Investigation, scene by scene, of all the plays produced by each of the writers separately reveals a surprising consistency in the proportion of polysyllables. When entire plays are compared, the difference between the two authors is striking. Of Dekker's ten plays, the lowest has a word-average of .116; the highest, .252. Of Webster's five plays, on the other hand, the lowest has a word-average of .296; the highest, of .349. Between Dekker's highest and Webster's lowest is an interval of 44 points. On the mathematical theory of chances, Mr. Pierce asserts that "when a scene has a word-average of .300 or more, the chances are 68.9 to 4.3, or 16 to 1, that Webster, and not Dekker, wrote it," etc. Of course, this test has its limitations. It is necessary to take into consideration the nature of the subject-matter; the dramatist will lengthen his stride when he steps into the tragic sock. Furthermore, there may be very genuine collaboration between two authors, though one of them never writes a word; in such case the test would be useless. But safeguarded by other tests and employed as cumulative evidence—as Mr. Pierce has employed it—it would prove a useful addition to the instruments of the investigator.

We have received from the Catholic Summer School Press of Fordham University a second edition of Dr. J. J. Walsh's "The Thirteenth, Greatest of Centuries." When this volume of lectures first made an appearance, two years ago, the *Nation* said that, paradoxical as was the thesis suggested by this title, no great difficulty existed in understanding the point of view from which it was deduced. "Name the thirteenth century, and immediately we think of Dante and his supreme vision; of the Latin hymns, . . . of St. Francis, who for a while made Christianity a reality of common life, of Thomas Aquinas, . . . of the Gothic cathedrals." The new edition of this narrative of the "age of faith," which is, of course, considered from the standpoint of a devout Roman Catholic, presents in its appendix "some authoritative opinions that will enable readers to see that many of the author's ideas . . . are shared by men who have devoted the better part of their lives to the special study of the questions on which their opinions are quoted." There are also certain corrections and revisions in the body of the text. As for the appendix and its strange assemblage of testimony, while it makes suggestive reading, it hardly goes to strengthen Dr. Walsh's book. Even though it is nowadays in order to attack the eighteenth century, whether from the base of politics, or of social theory, or of the arts, yet it is decidedly indiscreet to make any so general statement as that "The eighteenth century provided practically nothing that was to live and be a vital force in after times."

"Railroad Promotion and Capitalization in the United States," by Frederick A. Cleveland and Fred Wilbur Powell (Longmans, Green & Co.), is not, as one might be led to expect from the title, a study in present-day corporation finance. It is rather a history of transportation development with particular reference to the sources from which funds were drawn for canal and railway building, and to the methods employed to obtain these funds. As a background for the presentation of the main thesis, much detailed information concerning the general history of railways is given, some of it not heretofore published. The history of the transportation funding policy is traced carefully through all its stages—efforts to secure national aid and their meagre results, State enterprise, and its failure, State and national aid to private companies, and local and individual subsidies. The authors are disposed to be lenient with the early railway promoter, to consider him as a product of his social environment, and to question the right of present-day students to judge him by what they call "the new morality of to-day"—a point of view made more or less familiar nowadays by frequent repetition, but none the less difficult to accept. With regard to subsidies in general, the authors reach the conclusion that there is "evidence sufficient to show that the policy of granting subsidies to railroads was not only unnecessary, but also that it was of questionable value to the companies themselves." The book contains an elaborate bibliography of nearly fifty pages.

The press of W. H. Lowdermilk & Co., Washington, has just issued a small, well-printed duodecimo, "Deck and Field," containing Frank W. Hackett's two addresses delivered before the Naval War College while he was assistant secretary of the navy, and ten others on certain commemorative occasions. He is rather slow generally in getting under way, and he labors too often under the disadvantage of a trite subject. Little that is new can be expected on July 4, or Flag Day, or at a Grand Army post meeting, for example; and we all know what an assistant secretary of the navy will say at the opening of a War College session. On the other hand, when he deals with things outside the ordinary course, he is very interesting. This is especially true of his account of the services and untimely death of the gallant Lieut.-Commander Charles W. Flusser, an heroic name, not so well known as it should be. Mr. Hackett was himself present, as an officer of the Miami, when that vessel was attacked by the rebel ram Albemarle in 1864, and he speaks with personal knowledge of the action. He does full justice to the memory of his noble commander, who was killed by fragments of the shell he had himself discharged against the enemy at so close a range that her armored side almost touched the muzzle of his own nine-inch gun. Mr. Hackett has performed a graceful act in thus recalling to mind Flusser's courage, professional skill, loyalty to the flag, and religious devotion.

Another group of tales has just appeared in The Romance of The East Series. It is a little volume of stories extracted from Somadeva's "Kathāsarit-sāgara," and edited by Dr. L. D. Barnett (Dutton & Co.). As Somadeva is a well-known author, and the text has before this been completely translated, it is necessary to say only that "The Golden Town" (as Dr. Barnett calls the whole volume) contains several excellent specimens of the work of the famous Hindu romancer.

The significance of the new work of Karl Kautsky, the protagonist of the theories of Social Democracy, entitled "Der Ursprung des Christentums" (Stuttgart: J. H. W. Dietz Nachfolger) lies in the fact that it undertakes in a scientific manner to furnish a full explanation of the genesis and early development of Christianity from the social democratic point of view. He substitutes the materialistic principle for the "individualistic" of the historians and the theologians, and accordingly does not find the active forces of historical development in the ideas and actions of individuals, but in the movements of the masses interpreted as a natural development. Accordingly Christianity is to be explained chiefly as an outgrowth not of the personality of such leaders as Jesus or Paul, but of the social and cultural agitations of the day, chiefly of the Zealots who were the most radical exponents of Messianic thought of Israel. This party, according to Josephus, had already produced a large number of claimants to the Messiahship, all of whom died a violent death, just as Jesus suffered the death of a rebel. Christianity itself originated in the communistic ideas and ideals that had been imperfectly voiced by the Essenes

and Therapeutes, and later Christianity transferred these theories to their idealized Jesus. The original communistic Christianity, however, was soon perverted through the influence of the wealthy and the development of a hierarchical episcopacy. Kautsky's methods of dealing with the sources are very arbitrary, after the principle of *stat pro ratione voluntas*. He regards as historically trustworthy the report of Acts on the communism of the first congregation in Jerusalem, but practically discards the rest of the book as he does the whole record of the four gospels, and entirely ignores the Pauline literature.

In the Oxford Higher French Series, edited by Leon Delbos (Clarendon Press), appears Victor Hugo's "Préface du 'Cromwell,' " rightly envisaged by its editor, Edmond Wahl, as a document of prime importance in the history of romanticism—the manifesto, indeed, and call to arms of the "Men of 1830." The introduction (in French), at once lively and solid, recalls vividly that time of *cénacles* and politico-literary ferment, traces with a firm hand Hugo's antecedents and consequents, and assigns to the "Préface" its place both in French literature and in general literary theory and criticism. Of special interest are the treatment of Hugo's central concept of the grotesque; the estimate of the omissions and limitations of the "Préface" considered as a statement of romanticist principles; and the plain inference that, in Hugo's fundamental truths concerning the relation of life to art, classic and romantic are agreed, while both are anticipated in Aristotle. This admirable edition is more than a college text-book for courses in poetics, criticism, French literature, or comparative literature; it is a book to possess.

"Robespierre et le procès du paratonnerre (1780-1784)," by Charles Vellay, is a pamphlet of thirty-one pages, giving in great detail, and largely from manuscript records, the story of Robespierre's argument before the courts of Arras, in defence of the right of his client, a resident of Arras, to put up a lightning-rod on his house. It is a graphic picture of the conditions of life in provincial France before the French Revolution. The help of the experts in Paris, Condorcet, Le Roy, Élie de Beaumont, and, in Dijon, Maret and Moreau, and of lawyers without end, was invoked to overrule the unfavorable decision of the local court. After much discussion in scientific bodies and in the press, Robespierre made the final and successful argument, and it was printed both at Arras and Paris, in pamphlets that have become very rare. Le Roy of the Paris Academy of Sciences wrote that Franklin told him the original condemnation of his lightning-rod by the Arras Court was quite inexcusable, for it was in use in France and Germany and Italy and Russia, as well as in Great Britain and America. All these facts Robespierre used with force and effect in his argument, and when the case was favorably decided Robespierre sent to Franklin a copy of his pamphlet, with a letter, unknown to his biographers, but now in the Library of the University of Pennsylvania. This letter was reproduced in photography a few years ago, and is reprinted by M. Vellay in this interesting little pamphlet. The argument itself is reprinted in the recent number of the *Annales Révolutionnaires*, the organ of the Société des Études Robespierristes, which is now publishing all of Robespierre's own writings and all historical documents. It thus helps us to a better knowledge of the epoch of the French Revolution, still in need of analysis. That two men of such different careers and characters as Robespierre and Franklin should have been thus brought in touch on one point, is of itself of interest. Even more interesting, however, is the light thrown by M. Vellay's pamphlet on the social conditions of France in the days of Robespierre's youth, and on his professional and political progress by his defence of Franklin's invention. The account of a solemn session of a local Parliament, in which Bishops, Clergy, Noblemen, and the Tiers État listened to a scientific description of his lightning rod, is a capital picture of public life in France in 1783.

Philipp Stein, editor of the *Bazar*, has died in Berlin at the age of fifty-five years. He was the author of works on Ibsen, Goethe, and other subjects.

From Berlin is announced the death, at the age of fifty, of Dr. Albert Römer, editor of *Korrespondenz für Kunst und Wissenschaft*, and the author of works on Fritz Reuter, and other authors.

Science.

Cave Vertebrates of America.. By Carl H. Eigenmann. Publication No. 104, Carnegie Institution of Washington.

This work may be called a study of degenerative evolution, and although much of it is necessarily technical, the general facts and summaries are of wide interest. Dr. Eigenmann has left no department of his subject untouched, from an exhaustive chapter on the general consideration of caves to histological descriptions of the degenerate eyes of the inhabitants. The method of colonization of a cave with living creatures may be involuntary, as in the case of aquatic creatures carried into underground channels, or, as in the case of non-aquatic forms, voluntary; there following a gradual adaptation to new conditions. Among the factors at work may be mentioned the twilight entrance section, the section of fluctuating temperature, and the cave proper. In this last portion we have absence of light, constancy of temperature, and the absence of all, except imported, food.

One of the most interesting statements in the general chapter is that some widely-distributed cave species have independently arisen in different places from a far-ranging terrestial species. Dr. Eigenmann is correct in stating that there are no blind birds, but the mention of the phœbe and owl is entirely aside from his subject, while the omission of the apteryx, with its reduced vision and increased tactile sense, is regrettable.

Thirty-five pages illustrated with many excellent plates are devoted to the consideration of blind or cave vertebrates other than fishes; the eyes of the mole, the cave rat, the cave salamanders, and such reptiles as *Amphisbœna* and *Typhlops*. Although many of these eyes have an extremely primitive appearance, yet all are the result of degeneration from complex organs of vision, and hence are essentially adaptive. The active components of the organ, such as the optic muscles, are the first parts to degenerate.

Fishes occupy by far the major part of the monograph (about 175 pages), and especial attention is given to the life and development of the *Amblyopsidæ* and of the Cuban blind fishes. In regard to the former the author concludes:

> It is evident that the causes controlling the development (of the eye) are hereditarily established in the egg by an accumulation of such degenerative changes as are still notable in the later history of the eye of the adult.

Thus we are led to reflect on the inheritance of acquired characters. The sequence of development of the degenerate eyes of this group is summed up in these words:

> The foundations of the eye are normally laid, but the superstructure, instead of continuing the plan with additional material, completes it out of the material provided for the foundations. The development of the foundation of the eye is phylogenetic, the stages beyond the foundations are direct.

In an interesting final chapter on the causes of individual and phyletic degeneration we read: "Considering the parts most affected and the parts least affected, the *degree of use* is the only cause capable of explaining the conditions." It is a pleasure to know that at least one scientist does not take refuge in the all-convenient explanation of mutation!

The typography and both the colored and the uncolored illustrations are up to the very high standard set by other publications of the Carnegie Institution.

When Prof. Charles S. Myers says, in the preface of his "Text-Book of Experimental Psychology" (Longmans), that the lack of such a volume has been keenly felt, he has in mind English schools, not American. Although the writer disavows offering an introductory outline of general psychology or more than a guide through the psychological laboratory, he really has combined history, theory, and criticism to a far greater extent than most other authors of experiment manuals. In addition to the 155 investigations covering all the usual problems, there is a compact account of the latter and the various interpretations of them. Whether this is a virtue or a defect, each teacher will answer according to his own predilections for a more or less stern inductive handling of psychology; but Professor Myers's free mixture of authoritative statement, history, and direct inquiry is surely in line with the dominant tendency.

The author's personal knack of teaching is frankly reflected in the order of topics. Here lies cause for dissent. In showing a beginner what experimental psychology strives to do, and how it does it, one must pass from the simpler problem and the less delicate experiment to the more complex and more delicate. Professor Myers, however, goes from skin sensations to hearing, thence to the labyrinthine and motor sensations, thence to sight, and finally to the very easily managed taste and smell qualities. Reaction times, the tyro's delight, are treated after the very difficult question of statistical method, which is discussed with such brevity that collateral lectures and reading are indispensable. The result throughout is that Professor Myers must resort to bracketing large sections of each chapter for later reading. Apart from this literary confusion the subject-matter is, for the most part, clearly and adequately set forth—if anything, perhaps too adequately for a strictly elementary work. The appended descriptions of psychological instruments and their use are clarified with numerous mechanical drawings, and leave nothing to be desired. As a whole, the book makes heavier demands upon the beginner's maturity and earnestness than could be ventured on in one written for the American undergraduate.

As a testimonial of twenty years of friendship with the English investigator, Prof. Wilhelm Ostwald has translated Sir William Ramsay's recent work on the past and future of chemistry ("Vergangenes und Künftiges aus der Chemie"; Leipzig: Akademische Gesellschaft), and Professor Ramsay has returned the compliment by writing for the German edition an interesting biographical sketch of considerable length, which does not accompany the original English volume. Professor Ostwald adds some novel comment, and asks if the German universities have really attained to the high standards and ideals which Sir William in his enthusiasm is inclined to ascribe to them.

A six months' "General Exhibition of Hygiene" is to be opened in Buenos Ayres in May, 1910. The direction offers three classes of prizes for exhibits: one in a strictly national competition, the second in a competition limited to the Latin-American countries, and the third in a general competition. In connection with the exhibition will be held an international American Congress of Medicine and Hygiene. Congress and exhibition alike commemorate the first centenary of the May Revolution of 1810. The congress is divided into the following sections: biological, medical, surgical, section of public hygiene, pharmacological and chemical, and sections of sanitary technology, veterinary police, and dental pathology.

John Janvier Black, M.D., of Newcastle, Del., died in that place September 27, in his seventy-third year. He was a graduate of Princeton College and of the medical department of the University of Pennsylvania. He wrote "Cultivation of the Peach, Pear, and Quince," "Eating to Live," and "Forty Years in the Medical Profession."

Dr. George Cuvier Harlan, an eye specialist, of Philadelphia, died in that city on September 25, aged seventy-four years. He was a graduate of Delaware College and of the medical department of the University of Pennsylvania; and during the civil war served as medical officer on board the gunboat Unlon, and as surgeon of the Eleventh Pennsylvania Cavalry. He was formerly president of the American Ophthalmological Society, and contributed articles on his specialty to text-books and to medical journals.

Drama and Music.

English Nativity Plays. Edited with Introduction, Notes, and Glossary, by Samuel B. Hemingway. New York: Henry Holt & Co.

At the outset we wish to congratulate our editor upon his choice of subject for the doctoral thesis, published as No. 37 in the "Yale Studies." He has not only profited by the opportunity to exhibit sound scholarship but has given to the reading public a book of decided practical utility. The ordinary student can scarcely be expected to struggle with the whole ungainly corpus of plays locked up in the York, Towneley, Chester, Hegge, and other collections. One must be a trained scholar to coördinate properly Miss Toulmin Smith, Pollard, Deimling, and Halliwell-Phillipps. Accordingly, it is a downright boon to get in one volume a group of plays thoroughly annotated, and provided with a generous glossary (the initiated will best appreciate the force of the epithet) and an introduction that really introduces one to the general subject of the church plays in English. The Nativity group, here presented, is unquestionably the best possible selection. It has a certain dramatic unity of theme; it also offers the largest number of points of interest.

In one respect the volume is defective: it should have included the Herod-Magi plays. Their incorporation would have swelled the volume a good deal, but, if we are to have the Nativity plays, let us have them entire. The adoration of the Magi is an admirable set-off to the adoration of the Shepherds; besides, it is only after reading Herod's bombast that one appreciates Hamlet's exhortation to the players to avoid out-heroding Herod.

Upon the editor's introduction we offer a few criticisms. The remark (p. ii) upon the Devonshire manuscript of the Chester plays is not just to Dr. Furnivall. We would, furthermore, protest against the editor's designation of one collection as the "Coventry" plays. In his preface the editor renders his thanks to "Prof. John M. Manly of the University of Chicago for advice and encouragement." We are confident that Professor Manly never gave this particular bit of advice; on the contrary, he has said explicitly:

> I have chosen to call the plays by the name of the earliest known owner of the MS ["Hegge"], for I see no reason to connect them with Coventry; and "so-called Coventry Plays" is a clumsy expression.

These, however, are minor faults, and outweighed by the fact that the editor is peculiarly independent in his treatment of the Chester and the Hegge plays. His text of the former rests upon a personal examination of the Devonshire MS.; of the latter, upon photographs of the MS. Vesp. D. viii.

More serious are our objections to the editor's general views upon the liturgical Latin drama. Speaking frankly, we would urge him to turn aside from such second-hand writers as Davidson, and to acquire the method of investigators like Lange and Creizenach. If the scholarship of the past twenty years has accomplished anything, it has demonstrated: first, that the liturgical drama had its source in the very concrete visit of the three Marys to the Sepulchre; secondly, that the Christmas drama was added to the Easter movement as an imitative afterthought.

Concerning the supposed French influence in the Chester plays, pp. xxiv-xxvii, we suggest that there is a conclusive argument against the "popular theory . . . that they are little more than translations or adaptations of some French play that is now lost." And the argument, indeed, would apply to the other collections, York, Towneley, etc. The difference of structure between the French plays and the English is fundamental and organic; the French plays are in rhyming couplets, the English in more or less complicated stanzas of lyric tone. Now, although it is quite conceivable that a translator or adapter might change stanza-movement into couplet-movement, it is quite unlikely that he should reverse the process.

As disciple of the Yale school the editor could not be expected to refrain from "parallels." In theory we do not object to them; in practice, however, we find them at times inapt. Thus, the parallel between Percy's fierce protest against the "certain lord. . . . Fresh as a bridegroom" and the Towneley shepherds' grumbling at the "prowde swane" is wholly unilluminating. A genuine parallel, both in temper and in time, could have been found in "Piers Plowman," in the indictment of Wrong. The editor's citation, p. 286, of the Italian-French adage, "The devil is dead," would have been brought home to many readers by a reference to Denys the archer, in "The Cloister and the Hearth."

We have examined minutely the text of the first Chester play, as far as verse 208, together with the notes and relevant glossary entries. From this test we have gained a favorable impression of the editor's scholarship. The notes are decidedly helpful and the glossary is much superior to ordinary works of

its kind. Not that there is a total absence of error and oversight. For example, p. 217, note upon verse 8: "*This.* Evidently an error, misspelling of *thus.*" Spies, in his "History of the English Pronoun," shows that in Middle English the confusion of the words "this" and "thus" was chronic, and survived even in Elizabethan English. "Fulfellede," v. 100, needs amending to "fulfyllt," in rhyme with "guylte." In v. 106, the *y* of *syde* (seed) is assuredly in need of explanation; also the dialect form "yearth," v. 171, for "earth," deserves a note. The phrase "loveiy lore," v. 206, as it stands, is a crux. It cannot mean "acceptable doctrine." Our interpretation, which for want of space we cannot prove step by step, is that the phrase means "praiseworthy training"· training in the sense of Proverbs, xiii, 24. Still, these and similar faults do not impair the value of the work as a whole.

We have discussed Dr. Hemingway's book at some length, partly for its intrinsic merits, partly also because of its practical possibilities. Inasmuch as the appearance of Manly's promised third volume, to contain his introduction and notes, seems postponed indefinitely, those of our colleges and universities which undertake to teach the origins of the English drama are in need of just such a book as the present one. To everybody, instructor or student, this edition of the Nativity Plays will come as a welcome release from much drudgery.

We can do no more than register the appearance of three new volumes of the Tudor Facsimile Texts, edited by John S. Farmer and published by T. C. & E. C. Jack of London and Edinburgh. These additions are: "The Temptation of Our Lord," by John Bale, written in 1538, reprinted from the Bodleian copy, the only copy known to exist; "The Beauty and Good Properties of Women" [otherwise "Calisto and Melibæa"], from the single Bodleian copy (c. 1530) known to exist; and "The Marriage of Wit and Science," licensed in 1569-70, also from the single existing copy in the Bodleian. The character of these reprints is now known to all students of the early, and for praise we could only repeat what we have said of previous issues.

Moffat, Yard & Company will make an interesting offering in their "American Primitive Music," probably the first detailed treatment of Indian music, by Frederick R. Burton.

Art.

The production of artistic potteries in the United States has advanced rapidly enough to justify a third, and revised, edition of Dr. Edwin Atlee Barber's "The Pottery and Porcelain of the United States," published by G. P. Putnam's Sons. The original volume, which appeared in 1893, was a thoroughly creditable handbook of a little known subject. Through it many amateurs of this and other countries became aware of the existence here of an important fictile art which is almost as old as that of Great Britain. In arranging the present edition the author has added chapters on the development of the art since the Chicago Exposition, on recently discovered historical data, and on the pottery of Mexico. At least two rather famous potteries have been omitted from the exposition of present-day products. These are the pottery at Marblehead, Massachusetts, conducted very successfully for several years past in connection with a local "arts and crafts" enterprise, and the one at West Sterling, in the same State, which is directed by Mr. W. J. Walley. In general, the treatment of the artist potters whose names are familiar to followers of the handicraft exhibitions appears to be just and well proportioned. The discussion of Mexican potteries summarizes the results of Dr. Barber's expedition of exploration in 1907—a quest which proved the artistic value of the majolicas and other wares of old Mexico. The title of one of the chapters transferred by oversight from the first to the third edition is misleading; "The Present Century" obviously refers to the nineteenth and not to the twentieth.

"Box Furniture," by Louise Brigham (New York: The Century Company), deserves a good word. Even the preface is interesting: not everybody has learned during a winter in Spitzbergen to utilize discarded packing cases as material for household furniture. In the body of the book directions are given for making from soap boxes, breakfast-food boxes, and other wooden receptacles which usually reach the chopping block, some one hundred articles of household furniture, "known to be useful," and, in some instances, "believed to be beautiful." The diagramatic illustrations by Edward H. Ascherman, from designs by the author, show rooms and corners of rooms which look almost too good to be true. Yet photographs, some made in a dwelling seven hundred miles north of the Arctic circle, others in social settlements of Copenhagen and of several American cities, prove that ingenuity and taste avail more than marble and mahogany in creating a harmonious and even sumptuous effect. Appreciation of what can be done with boxes and combinations of boxes should be valuable to the American who has a summer home or camp.

"Wirthschaft und Kunst" is the title of a solid volume of nearly 450 pages by Heinrich Waentig (Jena: Gustav Fischer), in which is outlined the theory and history of art tendencies in modern industry throughout the world. The main investigation is limited to England, Austria, France, and the United States, all of which countries the writer visited for first-hand study. The great work of Carlyle, Ruskin, and Morris, and the relations, growing ever more and more complex, between art and labor, art and necessity, are so clearly and forcibly discussed that these chapters of the work in themselves deserve wide publication. A chapter is given to France and England, dealing with the art movements in each country separately and then in common, and the agreement and radical dissimilarity in Austrian and German *Gewerbekunst* are shown. Forty-three pages sketch the historical development of American industrial art, Herr Waentig finding, with Prof. Karl Lamprecht, that, as yet, we have developed no really distinctive types. All, he says, remains a hodge-podge and a medley, as was shown in the little-of-everything nailed up at St. Louis, where "the American exhibit did not equal those of the European countries, and was distinctly disappointing in itself." The germ of industrial art in America is, however, conceded to be of the soundest quality, the provisions for instruction in drawing and manual training in the public and technical schools being of the best.

"La Peinture au Musée Carnavalet" (E. Sansot), by Alcanter de Brahm, is a convenient volume on the paintings in the museum of City of Paris history. These collections occupy the Paris house of Madame de Sévigné.

The exhibition at the Metropolitan Museum of Art in connection with the Hudson-Fulton celebration is notable, first of all, in its assemblage of paintings by the Dutch masters of the earlier half of the seventeenth century. This group of Dutch paintings includes thirty-four Rembrandts—and three more are to be added; twenty by Franz Hals (a greater number than was ever before collected); five, with another on its way to join them, by Vermeer of Delft; seven Hobbemas; four Salomon Ruisdael landscapes, and eleven Jacobs; besides Cuyps, Steens, and Pieter de Hooghs, etc., etc. The representativeness of the exhibition is to be attributed not only to the richness of the museum's own treasures, but also to the coöperation of Messrs. Morgan, Frick, and Johnson, and of Mrs. C. P. Huntington, Mrs. H. O. Havemeyer, and many others. The American part of the exhibition is rich in specimens of the work of Copley and other early portrait painters of his nation. And it was a happy thought to show, in addition to their examples of American painting, specimen work of our cabinet-makers, from the earliest colonial times to about the date of Fulton's death. Not the least important product of the museum staff's enthusiastic collaboration in the Hudson-Fulton fête is their promised issue of a richly illustrated catalogue of the Dutch paintings shown in their exhibition, edited by Dr. W. R. Valentiner.

STARTING A SPECULATION.

The beginning of a concerted movement to drive up the price of an important commodity on the market is always a striking event, and the present era has been so largely a period of spectacular operations of the sort, in many markets, that the community's interest in them has grown to be not only aborbing but perennial. These are the main reasons why last week's announcement that a great speculation was about to start, deserves some special comment. Stating, on Tuesday of last week, when cotton was selling at 12¾ cents a pound, his personal position in the market for

that commodity. James A. Patten went on to say:

I am firmly convinced that the present cotton crop will sell above 17 cents—that the record prices of the Sully year will be bettered. This conclusion is based solely on crop conditions and the increased consumption of the staple.

My firm has a private wire system extending all over the country, into the cotton as well as the wheat and corn producing centres. Our customers asked our advice about cotton and I began to investigate crop conditions. All the established reports pointed to a small production, and my own information was of the same character. Therefore, I am in the cotton market.

There are two distinct aspects to the incident, the personal and the economic. Mr. Patten's public attitude naturally lends strength to the cotton speculation; he comes into that market with the prestige of a remarkably accurate advance judgment regarding last season's wheat shortage, and of a remarkably successful speculative campaign. Traditionally, this is a dangerous reliance; for it is a curious fact about speculation in the past that success in one market has not by any means guaranteed success in another. The experiences of Keene and Gates in the grain market, after successful exploits in stocks, and Sully's rather absurd performance in the coffee market, on the heels of his seemingly brilliant cotton corner, are instances in point.

Taking the price of "December contracts" as a measure, cotton sold, three days after Patten's statement, at 13½ cents a pound, as compared with 12⅜ a week before, 10⅝ as recently as last June, and 8⅞ a year ago. In the decade past, cotton has gone above the week's price in one season only—that which followed the very short crop of 1903, when the spot price touched 16⅝ cents. It is fair to say, then, that the present price is high. With the causes for this high price and the argument for a price still higher, the public is familiar—the lowest "September condition" on the Agricultural Department's records, a destructive storm in the cotton belt last week, a planted area 1,452,000 acres below last year's, and a popular estimate of indicated yield not exceeding 11,500,000 bales, as against an estimated "world's requirement" from our cotton fields of 12,438,000.

This last consideration, it should be observed, does not disclose so wide a discrepancy as that of 1903, when the estimate of requirements was 11,250,000 bales and the crop 10,000,000. Supplies now on hand and the foreign crop indications are also very much larger than they were, six years ago. The present "world's visible" is 2,190,000 bales, as against only 1,139,000 at this time in 1903—which would offset, so far as comparisons go, a shortage of a million bales in this season's crop. India and Egypt, our two chief competitors in cotton production, estimate for a harvest between them, this season, 850,000 bales above the season past, and 1,300,000 bales in excess of 1903. These are the legitimate factors in the problem.

That the present American crop is short of normal requirements, is admitted; but, as the above-cited figures show, it must also be conceded that the present price is high. How much higher it can be made to go, is a question to which the speculators and the spinners will jointly give the answer. However much a commodity may be needed, there is some level of prices at which consumers will do without; to this, the past experience of every market testifies. The action of the cotton mills and the cotton consumers bore witness to it during the "Sully corner," when the price, having reached 16⅝ cents per pound in March of 1904, fell to 10¾ in June at the moment of greatest depletion of supplies, carrying down with it the speculators. We shall see how these aspects of the case work out in the coming cotton season.

The Safest Way To Earn 6%

Investors — small or large—should inform themselves on Irrigation Bonds.

These bonds are secured by liens on the most fertile farm lands in America. The value of the security is in many instances four times the loan. The first year's crop often sells for more than the loan—sometimes by several times over.

Some of these bonds are municipal obligations, like School Bonds. They form a tax lien on the real property within the district.

They are serial bonds, so one may make short-time or long-time investments. Each year, as part of the bonds are paid, the security back of the rest is increased.

The bonds pay six per cent.—a higher rate than one can obtain on any other large class of bonds equally well secured.

The bonds are for $100, $500 and $1,000, so one may invest either little or much.

These are ideal bonds, and they have become the most popular bonds that we handle.

We are the largest dealers in Reclamation Bonds. In the past 15 years we have sold 70 separate issues, without a dollar of loss to any investor.

Now we have written a book based on all this experience, and the book is free. Please send this coupon to-day for it, for you owe to yourself a knowledge of the facts.

Canby's The Short Story in English

By HENRY S. CANBY, Assistant Professor in the Sheffield Scientific School. xiii+386 pp., 12mo, $1.60.

A scholarly and entertaining history of the development of all the types of short story in every English period, the method of which, however, is largely critical and appreciative. The development of story types in the early Middle Ages is traced, and beginning with Chaucer a study is made of interesting personalities and their influence upon English narrative. The modern short story is given the fullest consideration, with special attention to the works and methods of Poe, Hawthorne, Kipling, Bret Harte, Dickens and Stevenson among others.

The Intimate Story of a Human Life

The Journal of a Recluse

Translated From the Original French

One of the most human and self-revealing documents ever given to the reading public is this autobiography of one man's life. No clue is given to this singular being's identity, but he appears as a very real and very likable personality in the attractive pages where he tells of his loves, friendships, hatreds, and varied adventures. "The style is easy, rich and limpid as a mountain stream. The atmosphere is wholly an outdoor one."

With Frontispiece. 12mo, $1.25 net. (Post. 12 cents)

The Nation.

NEW YORK, THURSDAY, OCTOBER 7, 1909.

The Week.

President Taft's decision that Alaska is not yet fit for self-government came simultaneously with a telegraphic appeal from the leading editors and mayors in Alaska begging him to recommend to Congress an elective legislature for this distant Territory. The President feels, however, that Alaska, because of the shifting character of its population, is not entitled to a Legislature, but he is willing to recommend that it should have the commission form of government, similar to that in the Philippines. This is a singular doctrine from an American President, however wise it may be. Alaska is tired of being ruled by an indifferent Congress thousands of miles away. It believes its whole development retarded thereby. It wants taxation with representation, and now it hears from Mr. Taft that what is good enough for the Filipino we hate and despise, is good enough for its citizens! This will hardly make Mr. Taft any more popular in Alaska. Those who think specifically about the Philippines, feel that it is quite right for them to be governed by an upper house comprised of Presidential appointees. But at least the Filipinos have their lower house. Is Alaska not even to have that? Mr. Hitchcock had better look at once to the Republican delegates from that Territory.

Mr. Bryan, in his present active campaign for rehabilitating the Democratic party and saving the nation, is happy in the possession of a rule that works both ways. When the unity of the Democratic party and the welfare of the nation demand it, he stands ready to castigate and rebuke so prominent a Democrat as Senator Bailey, bearding him in his own State. When Senator Bailey challenges Mr. Bryan to a joint debate, Mr. Bryan finds that the unity of the Democratic party, etc., will suffer when two of its ablest champions start to maul each other. Having set out to elect a Democratic Congress next year, Nebraska's faithful son thinks it unwise to accentuate the unhappy differences of opinion which animate Democrats when they talk on the tariff. Here, then, is a happy solution for an ancient difficulty. If Democrats, when they get together, will persist in fighting, then don't let them get together! Let Bryan at El Paso, San Antonio, and Dallas announce that Bailey is a traitor. Let Bailey at Austin, Fort Worth, and Houston proclaim Bryan a fraud, but let them not advertise Democratic dissension by appearing on the same platform.

Come one, come all, this rock shall fly from its firm base as soon as Dr. Wiley yields an inch in his fight for good food. For the moment, interest shifts from quality to quantity, from honest materials to honest measure. Why, Dr. Wiley asked the food manufacturers recently, does variation in the contents of bag, box, or tin always take the form of shrinkage? If bottles can never be blown into perfectly uniform size, why should the small bottle predominate over the large one? The question occurs: Is the science of practical chemistry unable to predict the exact amount by which butter in tubs or lard in pails is bound to shrink according to circumstance and season? And if such standards can be laid down, why not make it a rule of the trade to allow for the loss beforehand? On this issue, as on that of benzoate of soda, the manufacturers oppose the argument of practical need against Dr. Wiley's idealism. But, after all, experience has shown repeatedly that when once the standard is fixed and insisted upon, practical conditions have a way of adjusting themselves thereto. The factory legislation of three-quarters of a century has been based on the elementary proposition that the business man's right to his profit has definite limitations, and that certain "inevitable" conditions of industry must cease to be inevitable when public weal and fundamental right and wrong are involved.

Mr. Loeb's defence of what has been called his "undressing brigade" will satisfy nobody outside of official circles. If, as he alleges, his victims "seemed to enjoy" the operation of being stripped by customs inspectors, they are taking a curious way of expressing their thanks. In other words, Mr. Loeb would have it that the legal proceedings started are in the nature of blackmail or strike-suits. We believe nothing of the kind, and earnestly hope that the matter will be fought through to the highest court of the land. For we cannot imagine that such a search on mere suspicion is legal. The performance of Mr. Loeb's men would be disgraceful to the country's good name if there were authority for it in law. It is a public scandal, to be endured only because it must be useful in awakening people to the barbaric character of our tariff laws, and particularly of the personal-baggage provision. At present Mr. Loeb is a capital ally of the Free Traders.

It is impossible to deny that the New Jersey primaries last week resulted in a crushing defeat of the "New Idea" Republicans. They won in Hudson County, and carried here and there a ward or a district, but as a whole they were decisively beaten. In Essex County, in particular, where Senator Colby began by scoring his great triumph and making the party management "sit up," the "regulars" were on Tuesday overwhelmingly in the majority. Various explanations are offered, such as the "apathy" of the best citizens, and the absence of many natural Colby voters who went to New York to witness the celebrations, but they do not really explain. General causes must account for so general a defeat; and it has to be admitted that the first impetus of the "New Idea" movement seems to be lost This is partly because some of the reforms it aimed at have been accomplished, but more because the average citizen has grown weary of the fight, and has substituted indifference for his early enthusiasm. The New Jersey primary system is imperfect, but even the complete form of direct primaries can be, as we have often pointed out, used as skilfully by the professional politicians as the convention system, provided the voters neglect their duty. No sort of political machinery can work out our salvation unless intelligent and vigilant men are there to work it.

Kentucky's Governor comes perilously near falling into the temper of those

good people who would force the nations to keep the peace even at the cannon's mouth. Gov. Willson's stand against the night-riders has been a manly one. But when he advises the anti-pool tobacco growers to form liberty leagues for the purpose of waging war against the night-riders, he may be fomenting a greater harm than he seeks to cure. The trouble with Kentucky has been a constitutional paralysis of the sense of law. The methods of the vendetta have been introduced into the tobacco business. That very fact is reason enough why the same methods should not be introduced into the business of government. If the only way in which individual liberty and the right of property can be vindicated in Kentucky is by citizens forming themselves into guerrilla bands and potting each other from behind fences, the government of Kentucky might as well go out of business once and for all. If the local authorities and the State militia cannot cope with the situation it is the State's business to set up a police machinery that can. We do not speak of the last remedy, Federal intervention, because we do not believe that the need for such extreme procedure exists. Yet even Federal intervention must be tried before the Governor of a State sanctions a return to the primitive policy of tooth and claw. As Secretary Dickinson declared the other day, the men who founded the commonwealths beyond the Alleghanies would have blushed to see their descendants helpless in the face of disorder and anarchy.

The ten-hour law for women passed by the last Illinois Legislature has been declared unconstitutional by Judge Richard S. Tuthill of the State Circuit Court in Chicago. This has rendered it ineffective until finally passed upon by the highest State courts. The suit which led to the decision was brought by two women employees of a paper-box concern, who swore that if they were restricted to ten hours of labor, they could not earn enough money to support those dependent upon them. The judge held that the law violated the freedom of contract—a ground on which many a similar statute has been opposed. There is an obvious and irreconcilable conflict here between the welfare of women workers and freedom of contract. One can easily see that a demagogic Legislature could take liberties with it in ways seriously to impair the rights of working people and employers as well. But public sentiment has practically decided that in this country as elsewhere the present conditions of overwork are more dangerous than possible future evils. Incidentally, it has shocked people in Illinois to learn from the defence of the employers that one woman has to work eleven or twelve hours a day to earn enough to support herself and a sister in the simplest way, and that after thirty-two years of service, begun when she was only thirteen.

The tide of American emigration into Canada is still at the flood. The somewhat off-hand figures quoted in the press the other day, on the authority of a Canadian official, are probably exaggerated. Seventy-five thousand families gone to Canada in the course of a year would mean a population loss to us of nearly 400,000, which, on the face of it, cannot be true. But, take the 75,000 as the total of American emigration, and it is still an increase over the 60,000 settlers we sent across the border in 1906-1907 and in 1907-1908. This is eloquent commentary on what we have of late days been told concerning the exhaustion of our free domain and the necessity that confronts American agriculture of readjusting its methods to new conditions. We no longer have soil to scratch; the land must be cultivated. But the pioneer spirit is still strong enough in the West to make patient methods irksome to tens of thousands. Hence the lure of virgin soil and free acres in Canada's northwestern provinces. The emigration from the Central West does not mean a repetition of the tragedy of New England's farms. The vacated land in Iowa and Kansas is sold at a profit to other occupiers, who will put into it the labor and skill that new conditions call for. As for the loss of population and wealth by migration to Canada, at bottom the country feels that it is not, in any true sense, a loss.

The refreshing simplicity that characterizes the Wright brothers was not absent from the explanation volunteered by Wilbur Wright of the Cook-Peary difficulty. The newspapers are responsible for the whole thing, in his opinion. They "saw millions in it if they could get up a good row and could aggravate Peary into saying things that would make headlines." It is natural for a man who has accomplished great things in silence and seclusion to feel as Mr. Wright evidently does about the obstreperous commercialism of newspaperdom; but he has hit pretty wide of the mark in this instance. It happens that Peary began making his accusations against Cook before the wicked newspaper men had a chance to get at him, and eagerly employed the wireless telegraph for the purpose while still on the confines of the frozen north. The habit of shifting the burden of any indiscretion or extravagance on the part of a man of standing to the shoulders of the newspapers is general; and an odd feature of it is that those who do so are unconsciously committing the very fault for which they chiefly blame the papers—setting down as a fact what they have not taken the trouble to verify as true. Cases have not been unknown in which an indiscreet utterance ascribed to a man of eminence has been positively acknowledged by him as authentic, and yet his admirers or defenders have persisted in pointing to it as a glaring instance of newspaper fabrication. There is quite as much looseness in people's talk about newspapers as there is in the newspapers' talk about people.

As the time approaches for the House of Lords to receive the Budget from the Commons, indications multiply that they will not, after all, venture to throw it out. It is a plausible rumor which intimates the exertion of a certain influence to that end by the King. He could not wish to see the country torn asunder over a great Constitutional issue. Whatever action the Crown might lawfully take, would assuredly be in the direction of a quiet agreement which would be acceptable to both political parties. Such a "front-bench" understanding seems, indeed, to be forming. It would run on the lines of a bargain by which the Lords should accept the Budget, with whatever grumbling and wry faces, and the Ministry should promise to dissolve and have a general election early next year. That ought to please the Conservatives, eager for the fray as they profess to be; while the Liberals would be better content to

try their chance while they are popular with the country, rather than to wait for the slow melting of their majority and their prestige. The full text of Mr. Balfour's speech in Birmingham certainly does not bear out the theory that he would urge the Lords to defy the Commons. Almost his sole allusion to the subject was where he referred to the Prime Minister's speech, and said that those who liked it were "the gentlemen who nightly pray that the House of Lords may throw out this Budget, fully determined, if the House of Lords did such a thing, to go about the country denouncing them for their unconstitutional behaviour." The peers who want to fight can get small comfort from that.

It was Mr. Asquith who asked scornfully where English capital would fly to if it were driven out by the new taxes, as the Conservatives charge that it will be. He pointed to Germany, France, Italy, and the United States as eagerly engaged in finding new taxes with which to bear their militaristic burdens or carry out their social programmes. Now, however, he has been answered by a correspondent of the *Spectator*, who quotes the following passage from Price Collier's book, "England and the English":

> I know of not one but several English fortunes, and there are no doubt many more, which have been lodged in Switzerland, where there is no taxation on foreign securities. The books are kept there, the control is there, and this is done on the ground that taxation in England is becoming confiscatory. This means taking the very blood out of the veins of the body politic.

The correspondent approves of this, writing that "men will submit to hardship if it is fair; but no one will willingly submit to injustice." He believes, too, in Macaulay's prediction that "Rome was destroyed by barbarians from without; England will be destroyed by barbarians from within." This may perhaps be true; but at present we do not believe that Switzerland is to be the New Jersey among Continental States, and serve as a refuge for Britain's embattled capital. Unfortunately, money cannot be taken out of enterprises at home very easily, and as long as it stays in companies in England it must pay its share of the taxes. If Switzerland is to be to any extent the adopted land of the free and home of the brave who dare to flee the tax-gatherer, it will take, we believe, a more drastic budget than Lloyd-George's to bring it about.

Fuller details of Minister Millerand's project for the "finishing" of French mining and engineering students by an American tour are furnished by an article in the Paris *Figaro*. The training of French engineering schools is, of course, of the highest intellectual value. The fledgling graduate is a technician not to be despised by the scarred veteran himself. He has studied with zeal the factories, mines, and railways of his own land; sometimes he has made vacation tours in the *outre-Rhin*. But the French Minister of Public Works is persuaded that this is not enough. His engineers must know by more than hearsay what is being accomplished in foreign lands; it is, above all, to America that he would send them. The United States is the land "where industrial activity is prodigious—a country very different from theirs, in methods, customs, commercial procedure, temper, aspect of things. I am persuaded," he says, "that nothing is likely to be more profitable to our engineers than contact with such a civilization." It will be interesting to see how different standards and training may be reconciled. One reads of a railway engine that has for more than sixty years performed its duties on a French road. We do not build such engines here: we cannot, and we would not. In the proposed "Americanization" of the government engineering schools, there is a suggestion that our influence upon Paris is not, after all, confined to the creation of a Luna Park in the Champs Élysées. But it is to be remarked that M. Millerand's plan calls for a visit to the United States only after a severe technical drilling. That being so, good results can hardly fail to follow.

Reports of conflict between Russian and German officials at Harbin turn up with tolerable frequency. Russia's position in Harbin for a long time formed the subject of dispute with China. An arrangement was recently concluded by which the Russo-Chinese Bank surrendered its pretensions to what were virtually sovereign powers, but in turn was confirmed in certain extensive rights arising from its position as legal owner of the land on which the municipality of Harbin is situated. Nevertheless, grounds for difference persist. That it should be the German population of Harbin which is sharpest set against the exercise of Russian authority, lends color to the rumors of Germany's diplomatic designs in the Far East, centring about a policy of friendship with Japan to the ultimate undoing of the Anglo-Japanese alliance. Now, though Harbin lies far outside of the Japanese sphere of influence in Manchuria, it is natural enough that, in the affairs of the Far East as a whole, pro-Japanese should also mean anti-Russian. The Czar's government has lately given signs of its old hypnotic power over Chinese officialdom. Peking seems to have forgotten Russian injuries of five years ago, in its resentment at Japanese activity to-day. With the Stolypin Ministry working feverishly at the building up of Siberia, it cannot be many years before the Russian menace, as Japan views it, will be once more a reality. In the circumstances, German cooperation might be greatly relished at Tokio.

China reformed or China awakened is easily enough said; but what vast psychological difficulties are involved in a modernized China, is suggested in a picturesque incident recorded by the Peking correspondent of the London *Times*. Yung Lin, a Manchu official of low rank but exceptional literary gifts, recently addressed a memorial to the Regent on the unhappy condition of the Empire, and then committed suicide. This "wearer of the eighth button, possessor of a brevet appointment at the Hunting Park, and deputy ranger at the Summer Palace," was fully aware of the perils that beset the new régime. He saw incompetent officialdom wasting the resources of the empire. He saw the foreigner grasping at the nation's wealth. He saw the danger of domestic rebellion and aggression from without. And so, enumerating four principal reasons for shedding bitter tears and forcing himself into utterance, he prostrates himself reverently, memorial in hand, embodying "a fool's single successful inspiration." Which done, he decided on death, because he was aware that the law punishes him who speaks of what concerns him not. An enlightened patriot, as his words show him to be, working for reform by the traditional method of suicide—this shows the chaos of new and old connoted by the new China.

MR. TAFT'S COMPREHENSIVENESS.

The President's speech last week on "Conservation"—that finely vague thing which we all believe in, each of us reserving the right to say what it means—dealt with the last large subject on which he was expected to address his fellow-citizens during his present tour. He has spoken on judicial reform, on the tariff, on the amendment of the anti-Trust laws, on taxation, and now on the preservation of our natural resources and on the reclamation of arid lands by irrigation. What is the net impression one gets from this series of speeches? What clue do they give us to Mr. Taft's method and intentions?

As a public orator, the President has kept to the safe level on which he has long stood before the country. He shuns the sensational. In neither epigrams nor firebrands do his speeches abound. No one any longer expects him to drink up the Mississippi or set the prairies on fire. His way is, rather, that of the judge, writing with a somewhat heavily-moving pen careful summaries, which his immediate audience, under the impression of his winning personality, may have found interesting, but which, in cold type, do not stir the reader. This of itself is no bad thing. The country is ready, by contrast, to take considerable satisfaction and comfort in a President who is not an exciting orator. A speech which is low in rhetorical values leaves, at any rate, other values undisturbed. If that land is to be accounted happy whose annals are dull, something is to be said for Presidential addresses which do not set people by the ears. But while duly thankful for these mercies, we cannot help missing in these latest utterances of Mr. Taft something of that forthright courage and vigorous initiative which he gave us, for example, in his famous Ohio speech against Boss Cox, or in his plain-speaking address to the Southern Republicans, or his frank deliverance in Maine against the Dingley tariff. His "later manner," as the art-critics say, inclines to the comprehensive instead of the forcible. He seeks to embrace different views, and even, sometimes, to reconcile contradictories.

Signs of such a desire to be all-inclusive appeared in what he had to say about the tariff, as also in his discussion of the labor boycott in relation to the law against restraint of trade; but it is his speech at Spokane on conservation which best exhibits this working of the President's mind. A pretty violent controversy has been raging on that subject, in the West and elsewhere, and Mr. Taft develops agreement with both sides. He stoutly upholds Secretary Ballinger, but he also urgently requests Chief-Forester Pinchot to remain in the government service. Pinchot and Ballinger will not speak to each other, but the President folds them both to his capacious breast. He is heartily for the Roosevelt policies in respect of forests and mines and water-power, yet he insists that Congress has much to do in order to make them legal. Mr. Taft is rigidly for economy, but favors the issue of $10,000,000 in bonds to provide money immediately for the completion of work which the reclamation service rashly undertook, and has not the funds to finish. It is unnecessary to adduce other illustrations. The evidence is pretty clear that the President is hoping to bring in not simply an "era of good feeling," but a time when sharply differing public policies may lie down together peacefully like the millennial lamb and the lion.

It must be left to time to decide whether President Taft will be able, with his large good-nature, to make two walk together who are not agreed. To date, he has had much success in leading warring minds to agree at least in liking him, and in wishing his Administration the best things. But facts remain as ugly as ever, and political differences, based on principle, are hard to compose. Men may admire and applaud their President, without abandoning the policies and the causes in which, in their heart of hearts, they believe, and for which they are ready to fight. There are no indications, for example, that Mr. Taft's tariff speech at Winona, intended, no doubt, to be conciliatory, and to put an end to agitation, has had any real or permanent effect in laying that controversy. It remains an irrepressible conflict. As an excellent authority on Western feeling writes to us privately, the President's speech "did not make a dent" in the Western sentiment for tariff revision.

The President seems deliberately to have chosen to be all amiability and conciliation, on this long journey of his among the people. It is a rôle which he is eminently fitted to play. No kinder man or simpler democrat ever held his great office. But it would be a mistake to suppose that his smiling good nature is flabbiness; that he cannot be hard and stern, on occasion; or that he will not be immovable when an issue of sheer right and wrong is presented to him. Ask ex-Congressman Littauer about that! And it is inevitable, in the coming months, when popular ovations are over, and the hard work of administration and legislation presses upon the President, that he will be compelled to take sides strongly, and to make men feel the energy and determination that lie behind his affable manners. It cannot be said of President Taft, as it has been of Lord Rosebery, that he is a statesman who "desires the palm without the dust"; and he must know that he cannot come triumphant through the dust of future political struggles without displaying deep and unshakable convictions and an invincible purpose.

A PÆAN IN WOOL.

The September *Bulletin* of the National Association of Wool Manufacturers rejoices openly and loudly over the booty with which its owners made off in the Payne-Aldrich bill. Its review of the steps taken to prevent any reduction in the most oppressive and unjustifiable duties in the whole range of our protective tariff, shows plainly how the trick was done. The chief agent of the tricksters was Senator Aldrich, whom the *Bulletin* covers with fulsome praise. In a separate article entitled "Where Honor is Due," it lauds him for his "sagacity and finesse as a consummate manager of legislation," and declares that "the unmistakable figure" who "will be best and longest remembered" for having resisted reductions in the woollen schedule—and so, we add, for having made the lot of the poor harder, and swelled the ravages of tuberculosis—is "the great senior Senator from Rhode Island." He scored a victory for the woollen manufacturers because, as the *Bulletin* innocently says, he "managed to take counsel with the men best equipped to speak for the actual conditions." In other words, the woollen manufacturers "saw" Aldrich, and he did the rest.

This pæan of the wool manufacturers

was composed, of course, before President Taft spoke at Winona on the tariff. If he had been able previously to read this unblushing account of the way in which the demands of the consuming public were denied, he might have phrased parts of his speech differently. He would scarcely have said so gravely, for example, that Aldrich "found" the opposition of Republicans so strong that he had to abandon the attempt to reduce the woollen duties. Having first created that opposition, the Senator naturally "found" it when he looked for it. But even as the case stands, the Republican *Bulletin* puts itself unconsciously and ludicrously in antagonism to the Republican President. It glories in the schedules, as enacted, asserting that they are a perfect model of protective legislation, and that no one sought to have them reduced except Democrats, "frothy insurgents," and people who "were regularly drawing the ammunition for their attacks from the hostile European manufacturing and importing interests." If this be so, then Mr. Taft must come under one or another of the above classifications, for at Winona he said squarely:

> With respect to the wool schedule, I agree that it is too high, and that it ought to have been reduced, and that it probably represents considerably more than the difference between the cost of production abroad and the cost of production here. The difficulty about the woollen schedule is that there were two contending factions early in the history of the Republican tariff, to wit, wool-growers and the wool manufacturers; and that finally many years ago they settled on a basis by which wool in the grease should have eleven cents a pound, and by which allowance should be made in the shrinkage in the differential upon wool manufactures. The percentage of duty was very heavy—quite beyond the difference in the cost of production, which was not then regarded as a necessary or proper limitation on protective duties. . . .
>
> It is the one important defect in the present Payne tariff bill, and in the performance of the promise of the platform to reduce rates to a difference in the cost of production with reasonable profit to the manufacturer.

Though the *Bulletin* could hardly have foreseen this utterance by the President, it arrayed itself in advance against his idea that tariff duties ought to be scaled to the difference in cost of production at home and abroad. For itself, it sighs for the splendid and patriotic spirit in which the Dingley bill was framed. The people, at that time, "were in no mood to measure the amount of protection by a microscope, nor were they at all disposed to be anxious lest some particular rate might give the American some undue advantage over the foreign manufacturer. They were very frankly willing that the American should have the benefit of the doubt." It was in this sense that the President of the National Association of Wool Manufacturers, Mr. Whitman, informed the Ways and Means Committee that "comparative costs of production in the United States and foreign countries" were "unobtainable." The subject did not interest him.

This same Mr. Whitman, it will be remembered, is the gentleman who was exposed, last year, as having secretly manipulated the woollen schedules of the Dingley bill so that, indeed, a "particular rate" might give "undue advantage" to himself. Our readers can scarcely have forgotten his famous telegram to S. N. D. North, then conveniently a clerk to the Finance Committee, as well as secretary of the Wool Manufacturers. Mr. Whitman displayed no false modesty in then telegraphing:

> Of course, Messrs. Aldrich and Dingley will do all they can, but I depend upon your letting them know what I need. I depend upon you. Dress goods, yarns, and tops.

As is well known, this appeal led to a tricky duty upon tops and yarns, designed adroitly for Mr. Whitman's private benefit. What has become of that "particular rate" of his in the Payne-Aldrich bill? The *Bulletin* tells us with a grace of evasion which all must admire. The Whitman duty on tops was too nauseous for even Aldrich's strong stomach. Its revision was one of the three minor changes made this year in the Dingley woollen schedules. Says the *Bulletin*, elegantly, the new and separate duty on tops, abolishing the old Whitman fraud, "bears a proper symmetrical relation to the whole plan" of woollen duties. That is to say, Mr. Whitman had been getting more plunder than "symmetry" allowed, and has been forced to give up a part of it.

Tariff reformers ought to reprint this official glorification of protection for wool and woollens, as being really the most effective attack that could possibly be made upon the whole system. When men who have, by subterranean political stratagems, secured the legal right to exact the uttermost farthing from those who buy clothes, when such men come out in public to gloat over the spoil which they now have to divide among themselves, there needs no further proof that something is rotten.

TAMMANY AND CANNON.

It is a scandal of national proportions of which Congressman Parsons has now forced public discussion. Privately, the thing has long been whispered about. No one of the responsibility of Mr. Parsons, however, had openly declared, as he did on Saturday, that a political plot involved Speaker Cannon, and up-State Republican leaders of New York, and Tammany Hall. The assertion is both more sweeping and more specific than previous versions of the story. It was known that Cannon and his lieutenants in the House had secured the votes of 23 Democrats, eight of them from New York city, in the desperate effort to maintain the regular organization of the House against the "insurgent" Republicans acting with the bulk of the Democrats. Secret bargaining was naturally suspected and even charged openly. Such political alliances always have their *quid pro quo*. One of the considerations, hinted then and since, was an agreement by which Tammany Democrats should vote with Cannon on condition that New York city Republicans would not fuse against Tammany this year. But Mr. Parsons goes far beyond that. He alleges a compact extending to legislation at Albany. As a part of the payment which Tammany got from Cannon, through the Republican up-State go-betweens, the bill to make Tammany election frauds more difficult was killed, as was also the amendment to the public-service law bringing the telegraph and telephone companies under governmental control.

In brief, Congressman Parsons alleges one of the wickedest political agreements ever made. It involved a tacit understanding and working together for mutual benefit between Tammany and the Republican majority in the Senate at Albany. And now State Senator Raines comes out in a burst of virtuous indignation at the very idea of such an alliance. To his pure mind, the thing is unthinkable. But the records exist, and memory remains. In sorrowful fact, the active coöperation between Tammany and the Republicans, between

Grady and Raines, was notorious all through the closing weeks of the last session of the State Legislature. The affair was so open that newspaper correspondents freely commented upon it At least one honest Republican Senator, who saw what was going on, publicly denounced the alliance. Why, at times it was difficult to tell who was the real leader of the Senate, Raines or Grady. They played into each other's hand perfectly, and on more than one occasion the Tammany Senator actually took charge of pending legislation. In al. this, there is certainly good color fo" the direct charge which Mr. Parsons now makes.

He has not, as yet, mentioned names, but one of them stands blazoned on the record. We mean, of course, ex-Congressman Littauer. Although not a member of the House, he was one of the most active agents of Cannon in meeting the movement to break the Speaker's power. His services were openly acknowledged by a clause in the tariff, originally drawn for his personal profit The proposed outrageous duties on gloves had no defence except that of Speaker Cannon, who frankly admitted that they were Littauer's reward for aid given in the House fight. It was on that basis that Mr. Cannon demanded of the President that he should withdraw his opposition to the glove duties. But Mr. Taft replied that, even if those rates were justifiable in themselves, they could not be defended as part of a political bargain, and he would not sign a bill containing them. Since then, Mr. Littauer has been going about as one robbed of his lawful booty. Now, what was the nature of the service he rendered the Speaker? It could not have been merely the lending of his persuasive powers with former associates. It is not probable that Riordan and Goldfogle and Goulden and the other Tammany Democrats voted with Cannon simply for the sake of Mr. Littauer's *beaux yeux*. Who so likely as he to have been the negotiator of the deal between the up-State Republicans and Tammany, of which Mr. Parsons now speaks so boldly? A fine type of the scholar in politics, Mr. Littauer has applied his Harvard culture to the sharpening of his practical intelligence, until few can surpass him in the art of legislating money into his purse by means of a tariff-clause, or in understanding the subtleties of machine management.

If he, given all the circumstances, is strongly "indicated," others must also have been engaged in the nefarious plot which Mr. Parsons has disclosed. Their names, too, ought to be given to the public. We can always centre popular indignation better about a personality than an abstraction, about conspirators better than a conspiracy. When Mr. Parsons gets ready to meet those who are now challenging his veracity, we hope that he will omit no detail and keep back no name. His immediate object, we presume, was to fasten attention upon Tammany's preparations for electoral frauds in the coming city election; but the matter cannot end there. It transcends any question of municipal politics, or even of parties in this State. Tammany may win or lose; the Republican machine may or may not oppose Gov. Hughes; but if legislation at Albany is to be sold to help the party organization in the House of Representatives, if the Speaker at Washington is to license Tammany to commit election crimes, we have an evil that goes deep into our whole public life, and that must be laid bare and cut out at all hazards.

NEW YORK, PAST AND PRESENT.

It is manifestly easier to find the points of difference between New York a hundred years ago and to-day, than the points of resemblance. Adopt the ordinary mathematical method of measuring historic change, and we are pretty sure to fall into thinking that there is no resemblance at all. What can there possibly be in common between the city of 96,000 inhabitants and the city of four and a half millions; the city that lay huddled between the Battery and Canal Street and the Greater New York of to-day; the city that counted its wealth in millions and the one that counts it now in thousands of millions? The spirit of piety leads New Yorkers to speak of their city's cosmopolitan character almost from the beginning; but was the cosmopolitanism of New Amsterdam or of Alexander Hamilton's town really what is meant when they speak of cosmopolitan New York to-day? Are the ties that bind the city to its past sentimental entirely, or does present-day New York still stand to the city of one hundred years ago as the tree to the twig, as the man to the child? Of New York State's population of 315,000 in 1790, nearly 260,000 were of English speech and 50,000 were Dutch. The French, Germans, Hebrews, and all others counted a little over 5,000. Assume that the minor nationalities were concentrated on Manhattan Island, and you still have nothing that even forecasts the vast non-English population of the present day. To those who saw the racial contours of the men that marched before and behind the floats in the Hudson-Fulton pageant last week, it must have seemed that, while the language and the flag are the same, everything else has changed.

To tie up the present to the past there is the well-worn formula that modern New York is foreign in aspect but American in thought and aspirations. How else can it preserve its historic pride? Let a man walk through that amazing East Side, where the spoken tongue of one hundred years ago is scarcely heard; cross the bridge which, in spite of its mile and a half length and $16,000,000 cost, is as completely Semitic as any wooden pathway in the Jewish parishes of the Russian Pale, he will find, nevertheless, in the orderliness of the crowd, in a certain carriage of the body that speaks the consciousness of freedom and power, the trait that we call American, or American in the making. Let a man walk down First Avenue from the Harlem to the newest bridge; let him see the nations juxtaposed like layers in a cake, Italian, Jewish, German, Slav, Irish, and German again; but even there he will pick out the school buildings and the public squares as evidence that over the diverse elements broods a definite unity. To the satirist who points out that New York's politics are dominated by the Irish, her commerce by the Jews, her rough labor markets by the Slavs and the Italians, it may be enough to reply that just such an arrangement is what is called for by the American idea in its truest sense. In essence the strangers in the city's gates are all Americans now; in appearance, they are bound to become so in the course of time.

Yet that is really giving away more than the case demands. The city's cosmopolitan aspect leads one, as a matter of fact, to underestimate the importance

of what has been described as the American colony in New York. Add to the old Knickerbocker descent the recruits of native stock from the immediate hinterland and from the West and South, and the older elements of population are far from a negligible quantity in New York. The early American impetus is still quite manifest, in the social aspects of the city's life first perhaps, but in every other field as well. Not all its financial transactions are in the hands of new Americans, not all its trade is carried on by Germans and Jews, not even all its democratic institutions are manipulated by the Irish. In the universities, in the clubs, in the great business offices where the affairs of an entire nation are transacted, the native stock has an ample sphere. The cause of good government has received loyal service from men of long cis-Atlantic ancestry. The prestige of birth has by no means vanished, and, strange to say, not even from politics, where brute mass alone is supposed to count. In moments of political crisis a goodly number of leaders and candidates, conservative, radical, or demagogue, have been men well-rooted in American soil.

New York to-day is, therefore, closer in body to the city of one hundred years ago than might be superficially supposed. Accepting that, the New Yorker is quite free to admit the strength of the argument from spirit and ideals. As long as the metropolis is true to the essentials of democracy, it cannot be stripped of its American character. On the surface, New York is less American than Philadelphia, or even Boston. But it is more American than many a city less tinged with Europe, in its restiveness under misgovernment, in its dealing with large problems in a large though frequently in a blundering way, and even in its assumption, so irritating to its neighbors, that it is about the only thing on the continent that counts.

THE AMERICAN COLLEGE AND AMERICAN CULTURE.

Two articles that appear in the current number of *Science* testify to the prominence in the public mind of fundamental questions relating to college education. The first is the address of Dr. Elmer E. Brown, United States Commissioner of Education, as chairman of Section L of the American Association for the Advancement of Science, on "American Standards in Education and the World-Standard." This is, in the main, an historical sketch of the remarkable movement, or rather group of movements, toward the securing of something like uniform standards of college and university work. It is clear from Dr. Brown's survey that the desire to get rid of the anarchic conditions of two decades ago has been both widespread and earnest; and that the time when A.B. might mean anything or nothing, and when an M.D. might be either a country bumpkin who had been shoved through a two years' medical course or a scientifically trained physician, is rapidly drawing to a close.

Incidentally, the story of the movement offers a lesson in the possibilities of voluntary effort as a substitute for governmental regulation; and it is an interesting subject of speculation to consider whether higher education in our country would have been better served by a forced standardization, emanating from the State and national governments, than they have been by that irregular effort which, feeling its way from time to time, has slowly but surely effected organization. The final point of Dr. Brown's address is the need of an international understanding of such character that scholastic credentials given in one country may have a value easily ascertainable throughout the modern world, and thus pass current in foreign lands. That there may be value in some approach to such an agreement is likely; but its usefulness, we fancy, may easily be exaggerated, while its disadvantages—which Dr. Brown does not ignore—are certainly serious. And, indeed, organization, if carried out too mechanically, may well deaden the spirit it is designed to aid.

How far from conclusive of the cultural value of college education the mere fact of large organization must be is brought home to the mind by the other article to which we have referred—that of Mr. John Jay Chapman on "The Harvard Classics and Harvard." Mr. Chapman regards the unfortunate five-foot shelf with which the name of Harvard and that of its distinguished ex-president are connected, as exemplifying the whole spirit of our big colleges—their insatiable desire for more students and more funds, their readiness to resort to the same methods as those by which hustling business men promote their enterprises, their forgetfulness of the nigher and finer aims of learning in the mere perfecting of mechanical means. Whether the incident of the Harvard Classics furnishes solid basis for such an accusation or not, other grounds are sufficient to arrest attention. Most of our big colleges and universities have drifted into the adoption of methods that are too suggestive of the "drummer" and the advertising man. Mr. Chapman softens his blow so far as Harvard is concerned by expressing his belief that she is among the least of the offenders—that she is "morally and intellectually in advance of the other American colleges"; the force of the remark being somewhat weakened, however, by references which indicate that it is rather her past than her present he has in mind. In any case, he implores her to abandon the ambition to be the largest college, and bids her be content to remain the largest influence in the college life of America. "On the day after she had turned her face in this direction," he says, "there would be an improvement in spirit in every university in the country."

When President Eliot made the remark out of which the business of the Harvard Classics grew, he doubtless had nothing in mind but putting in the form of a brief and not too careful statement an idea which, properly understood and properly qualified, it would be desirable to disseminate. That the spirit of true learning can be got rather by real assimilation of a few great thoughts and appreciation of a few great literary works than by any amount of lifeless instruction, is possibly something like what a man of culture might mean if he spoke of a five-foot shelf of books as capable of providing the essentials of a liberal education. But to give the multitude to understand that fifteen minutes a day solemnly applied to the task of working off the set of books, inch by inch, will transform anybody into a man of liberal education, is to turn the whole idea of our colleges into ridicule; and a final touch of grotesqueness is added when the five-foot shelf, instead of being vaguely indicated or left to the imagination, is expressly prescribed, and arrangements duly made to supply it, the same for all comers, through the familiar machinery of the subscription coupon. Such a scheme savors of that purely quantitative ideal

and, we may add, that itch for advertising, which are the disagreeable features of mechanical organization.

It is the failure of President Eliot to see this aspect of the matter that is by far the most deplorable feature of the case. This does not mean that a Lincoln may not get an effectual education out of his Bible and his Bunyan and his Æsop, read by the firelight in his cabin with consuming devotion and earnestness; it does mean that nobody will ever devise a prescription of which a *quantum sufficit* will take the place of the true love and tradition of culture. Among the "problems of the college" there is none more vital than that of retaining the distinctive ideal for which, however they may have varied as to means, the best of American colleges have always stood; and if to belie that ideal is to do a great hurt to the cause of the higher education, this affair of the Harvard Classics must be regarded as nothing less than a misfortune.

SUGGESTIONS FOR AN HISTORICAL LABORATORY.

It would seem to be a truism that the facilities which are to be regarded as indispensable to the proper study of a subject, and which ought, therefore, to be provided as a matter of course, should, like the methods of teaching, be determined by the nature of the subject, or, in other words, by the kind of material with which it has to deal; but the disparity in the equipment of the various departments of study and research commonly to be observed in even the best and richest American colleges and universities seems to indicate that, so far at least as the so-called "humanities" are concerned, little provision of appliances, save modest shelter from the weather and seats enough for the class, is generally thought absolutely necessary.

No one who knows at close range the "plant" of a typical American university will be at a loss for striking and even painful illustrations of the unequal distribution of material equipment. Broadly speaking, the departments of physical and natural science and engineering do not seriously lack the primary facilities which the nature of their work demands. Upon these departments, in the last twenty years, the wealth of the State and of individuals has been poured out like water, while more than one institution, spurred by a demand for "practicality" and "efficiency," has gone to the length of drawing upon its capital to supply what was wanting. Our institutions of learning abound in well-contrived laboratory buildings for physics, chemistry, biology, and engineering, containing not only lecture rooms for the various instructors and laboratories for students elementary and advanced but also private laboratories and offices for the professors, exhibition and photographic rooms, libraries, lockers, and other special apartments. The rooms themselves are commonly well supplied with apparatus and material, distributed and apportioned according to the number of students and investigators, and increased by regular appropriation, and as a matter of course, as the number of users grows. There is usually a special janitor or caretaker for the building, and often one or more skilled persons regularly employed in making or repairing apparatus, preparing or caring for specimens or stock, and the like. It has long been a matter of common observation that the cost of maintaining the scientific departments of a university, or even of a small college, is out of all proportion to the cost of the other departments of instruction, that it is met by governing boards with comparative readiness, and that it is often afforded, it must bluntly be said, at the cost of deplorable and systematic niggardliness in other directions. Other things being equal, no scientist to-day would consider for a moment a call to an institution which could not afford him all of these things, nor would the scientific world reckon the instruction of an institution not so equipped as worth while.

When, however, we turn to those other departments of study still graciously referred to as the "humanities," departments which older graduates and commencement orators still tell us embrace the subjects of the deepest human interest, the disparity in material equipment is commonly so great as to be almost ludicrous. Who, of the thousands that yearly are driven or besought to drink deep at the wells of literature, or history, or philosophy, in our American colleges or universities, can fail to recall the desolate class-rooms, their bare and dingy walls relieved at the most by a few old maps, or a faded photograph or two in heavy wooden frames, the floors swept once a week and washed once a term, the hand-carved chairs and benches, the chalk-dusted platform and desk, and the foul air, which, in the majority of such institutions, enshrine the daily life of academic culture? Where the teacher of science is freely accorded a lecture room for his department alone, the teacher of language, history, or economics must, as a rule, share his quarters, poor as they are, with those of his colleagues whose principal apparatus is books, and must vacate his room promptly to make way for another class at the next hour. Many a high school does better for its teachers than this; indeed, the best of our modern high schools, bearing in mind the grade of their work, offer almost infinitely superior facilities for work in these departments than does the average college or university.

Widespread and depressing as this condition is, in general, in all of the departments named, the particular illustration which I wish to use at this time is that afforded by history and the related subjects of political and social science and political economy. Applying the test that the equipment of a department should be determined by the nature of the material with which the department deals, it is obvious that we have here a subject in which printed matter of a variety of forms, manuscripts, maps and charts, pictures and casts, and actual historical objects or reproductions, form the material basis for the student's work. Where the chemist uses books and apparatus, the historical student uses books and other material as apparatus. For the modern study of history, even of the elementary sort, one must be enabled to examine not only single books, such as may be got from a library and perused at leisure in one's home, but also extended sets and collections of books and papers, and this under conditions which will admit of comparison and note-taking and the use of the volumes in the actual work of the class-room. For the preparation of maps and charts, facilities in the way of tables and instruments are required entirely beyond what the student can fairly be expected to have in his own room; while especially is there need of abundant space for the permanent display of wall-maps, charts, pictures, and illustrative material, like coins, casts, and models, if the active use of such aids is to be secured.

Acquaintance with a considerable number of colleges and universities, large and small, in this country fails to disclose any appreciable number in which the material equipment of the historical department has passed much beyond the stage of crude beginnings. With exceptions so few as almost to be counted on the fingers, the most generous provision, always excepting the general library of the institution, goes no further than the use, prevailingly in conjunction with other unrelated departments, of one or more lecture-rooms; a "seminary room," furnished with a table and some chairs, and housing such odds and ends of books as the industry of the instructors or the intermittent generosity of friends has got together, reënforced by loans from the main library; and possibly an office, frequently shared by all the members of the department, where students may come for consultation. If, as seems rarely to be the case, the department has any adequate supply of maps, they have often to be kept in some out-of-the-way place,

and carried about from room to room as needed; and almost never are there tables and instruments for the drawing of maps and charts. Meagre as is such equipment, some of our leading institutions do not have even this. If it be true, as it seems to be, that student interest, particularly among men, in literature, history, and philosophy has declined markedly in recent years, may not something of the cause be found, not in the inherently greater attractiveness of mixing chemicals or dissecting cats and birds, but in the utter poverty and bareness of the quarters in which students of the humanities are commonly asked to do their work? If professors of history have fallen too much into the habit of lecturing, instead of teaching, may it not be due in part to the failure of the university to give even the ablest of them facilities for doing anything else?

I venture to suggest the following as the minimum equipment of an historical department in a university or large college. First, two or more suitable lecture-rooms, with ample blackboard space, map racks or cases, book shelves, and a lantern and screen. The rooms should be contiguous to the other rooms of the department and reserved exclusively for its uses. It is time that there were opportunity for a professor to put up a map without having to take it down again at the end of the hour. Second, a combined seminary room and library, available for study when not in use as a class-room; equipped, like the lecture-room, with adequate blackboard and map space, and housing a permanent library of duplicates reënforced by such temporary loans from the main library as are from time to time needed. Included in the furnishings of the room should be a sufficient number of small tables to accommodate each individual student, and file cases for photographs, cards, newspaper clippings, and temporary notes. For the supervision of this room, there should be provided a special attendant, preferably a trained library assistant, responsible to the librarian of the university as well as to the head of the department. Third, a room for map drawing and chart-making, with tables and instruments for draughting. Fourth, a typewriting room, supplied with machines for the use of instructors and students. Fifth, private offices or studies for the instructors.

Elaborate as such a provision of apartments may well seem to the teacher who to-day, like the wandering scholar of the middle ages, lectures wherever he can find a vacant room, it nevertheless is smaller than that generally allowed to the chemist or physicist. Of all the evils which present-day criticism of the college has brought to light, none is more serious than the evil of waste. The history teacher who, under the conditions common to most American institutions of higher learning, should teach his subject as he would like to teach it and as he knows it ought to be taught, would spend in useless mechanical drudgery more hours than he spent in lecturing. Most institutions with endowment enough to entitle them to a place on the "Carnegie list" have ceased to expect this waste from professors of science, and there is no reason why the time of the professor of history, political science, or political economy should not be regarded as equally valuable. If, under the influence of a general demand for at least the minimum of what is due, the governing authorities of all our universities could even be brought to realize that a ground plan of the city of Rome and a Rand-McNally map of North America are not a sufficient equipment for the teaching of modern history and diplomacy, one might face the future with a new hope.

Of the many advantages to the teaching and study of history which might be expected to accrue from the general provision of such facilities as have here been indicated—economy of physical effort, more accurate study of texts, improved note-taking and care of material, wider use of books and illustrative helps, general compulsory map-drawing, and many others—one in particular deserves more than passing mention. I refer to the change which would thereby be furthered in the prevailing conception of the nature and function of the university library. With only the exceptions that prove the rule, our libraries are supported and administered on the assumption that one copy of a book is sufficient for the needs of the whole institution, and that every one who has occasion to use the book must seek it at the main or central repository. It would seem to be obvious, however, that wherever books form the fundamental material for study, and, from the nature of the case, cheap reprints of selected texts or a few duplicates of inexpensive volumes will not suffice, the library has need of as many copies of a book as there are departments to use it; and that if, with but a single copy available, resort must be had by every one to the central library, the conflicting and often irreconcilable demands of different departments present one of the most serious barriers to the development of proper methods of instruction in non-laboratory subjects. No modern department of biology is asked to get along with one microscope, and that, perhaps, of ancient pattern and in bad order. Scientific apparatus in all lines is freely duplicated as a matter of course, the adequacy of the supply being not seldom used as an advertising argument to attract students; though, as a matter of fact, there is but little greater need for duplicate apparatus than there is for duplicate books. Practical considerations, of course, will preclude extensive duplication of large or costly sets, but a multiplication of copies far beyond what is now usual, and their distribution among the various departments having constant need of them, are necessities to be met if waste is to be stopped.

I hope that I do not make the mistake of supposing that, given such historical laboratories as have here been briefly described, the universities would forthwith produce historians. I make no plea for the application of the specific methods of any science to the study of history. But the student of history, like the scientist, has to collect and classify his material, examine and criticise his sources, compare and weigh his authorities, and study his *locale*. What a proper equipment can give him is, not the intellectual power and insight of the great historical writer, but the opportunity to do a student's indispensable work under the best conditions and with effective guidance, instead of doing it, as is too often the case to-day, under conditions of great disadvantage. That provision of such equipment would also stir the teacher to a more telling presentation of a subject to his class, and enable him to vitalize and dignify a department which, in this country especially, is too often thought of as but little related to current human interests, is not the least of its advantages.

WILLIAM MACDONALD.
Brown University.

RECENT GERMAN FICTION.

The summer fiction has been below the average in quality. Comparatively new authors grapple with vital problems and crowd between the covers of their books a variety of more or less timely questions, but their achievements are not in proportion to their endeavors. Such a work is a novel in two volumes, 'Verklärung," by Fritz Oswald Bilse (F. Fontane & Co., Berlin), who, by the way, is not the ex-lieutenant of the little German garrison, whose revelations some years ago were followed by a flood of anti-military fiction, but a gentleman, who, under the name "Fritz Wernthal," has recently attracted attention by a novel of tramp-life. There are plenty of psychological studies, too, either hopelessly commonplace in subject-matter, or devoted to some repulsive psychopathic problem, such as Stefan Vacano's "Sündige Seligkeit" (F. Fontane & Co.), which, being founded on fact, may have a place in medical literature, but is certainly out of place in fiction.

Among a score of works of questionable value and pleasure to the reader only a few are distinguished by originality of incident or character, or by their literary workmanship. Of these, "Die Rache der Heimat," by Hans

Ebhardt (F. Fontane & Co.), deserves to be ranked high. The author, whose previous work, "Von indischen Tagen und Nächten," was the product of his experiences in India, and especially in the German colonies, has chosen for his hero a man who left the fatherland in his youth and returns in his ripe manhood, with little money, debilitated by malaria, and burdened with a foreign wife. Barred by his sensitive temperament and scrupulous conscience from successfully engaging in the scramble for wealth, he forms a strong contrast with his three brothers, practical, prosperous business men of the type to be met in every large city of North Germany. To them he is the fool who has lost opportunities and thrown away chances, like their father. Even the invalid mother is disappointed in her favorite son, whose letters had been the mainstay of her life. Nor is the wife, whose Malay blood sometimes overrules her Dutch ancestry, a welcome addition to the family already far from harmonious. This tragedy of the prodigal who suddenly awakens from the dreams of home and fatherland to find the familiar scenes of his childhood effaced in the course of the city's growth, to see that his beloved fellow-countrymen have become hard, grasping, and coarse-grained that the "Deutsche Gemüt" is a phrase existing only in song, and that he is a stranger even to those of his own blood has been set forth by the author in a series of events logically evolved out of the hero's efforts to begin a new life and to adapt himself to the changed standards and conditions. He loses everything that tied him to the foreign world from which he had come: his children die, his wife deserts him, and at the end he is about to leave again the city of his birth, this time not as her son, but as a stranger she had failed to welcome. Yet through all vicissitudes, he has remained at heart himself, and has not compromised with the elastic morality of his brothers and business associates. This consistent and sympathetic portrait of an idealist type, more frequent in Germany fifty years ago than to-day, is Ebhardt's greatest achievement. The other characters are no less vital, no less convincing, men and women; but the hero is a figure likely to live for some time in the memory of his readers.

Hans Hart has chosen for the background of his novel, "Das heilige Feuer" (L. Staackmann, Leipzig), the struggles of the Clerical and Liberal parties of Austria for supremacy in the higher educational institutions. His canvas is large and the outlines of the narrative are sometimes dimmed by a confusing abundance of incidents and characters. To portray each of the latter with equal skill would have taxed the ability of an author of extraordinary gifts, and though Hart's knowledge of human nature is considerable, he has not always succeeded in materializing the creatures of his imagination. But his work has in it an element of thoroughgoing seriousness and sincerity, which command respect, and a background of actualities, which makes it a book of absorbing interest. The lure of a brilliant career, bought at the sacrifice of truth, honesty, and the better self, is the great temptation in the lives of the men with whom the story is concerned. These ministers of education, rectors of universities, and college professors are men whose success with the students and the intelligent people depends upon the earnestness and firmness of their convictions, while their official and professional advancement depends upon the ease and the cleverness with which they deny their principles whenever the drift of public opinion or the pressure exercised by higher authorities makes it opportune. There is more than a suggestion of recent events—the anti-German, anti-Semitic, and anti-Liberal feeling in certain circles of the empire. Besides these motives of cultural and timely interest, the love element, however germane to the action, seems of minor importance. This *Hochschulroman* conveys a vivid idea of the intellectual fermentation in modern Austria.

Quite a different phase of that country's life is presented by Carl Conte Scapinelli, who could not have chosen a more significant title for his story than the one it bears of "Prater" (L. Staackmann). For while the battles of intellect are fought in the universities, the press, and the theatre, that great promenade of Vienna is the gay and brilliant arena of minor vanities and ambitions. A symbol of the light-hearted, happy-go-lucky temperament of the *Wiener Kind*, it fascinates the foreigner and exercises a mysterious power over the native. In the Prater, the hero of the story has been dreaming his day-dreams. To the Prater, he repairs at every critical moment of his meteoric career; and there he chooses to end his life when the realization of his hopes and ambitions is followed by failure.

Margarete Böhme's "Rheinzauber" (F. Fontane & Co.) is a distinct deviation from the kind of fiction that made her famous. It may mean a return to the manner of her earlier works, which failed to attract the attention accorded to the "Tagebuch einer Verlorenen." It is the story of a family feud which ends when, after three generations, a child brings together the hostile branches, and a flood furnishes the dramatic stage-setting of the reconciliation. These bare facts of the plot seem commonplace; but there is strength in the delineation of the characters, and charm in the general tone of the narrative. The Mannebachs were skilled locksmiths in a town on the Rhine, until one of them invented a process for the manufacture of steel, and the brother robs him of the invention. Both commit suicide—the one from despair at the brother's treachery, the other from remorse. The inventor's heirs remain simple artisans in the little town; the others enjoy their wealth and position. The most striking character in the family is Frau Josefa Meier, who has been nursed and has brought up her children in the old hatred—an active, practical business woman, a strict but conscientious mother, who rules the family with an iron rod.

Hermann Bessemer is a new name, and the story which bears it on the title-page, "Mondnacht in Amalfi" (Albert Langen, Munich), gives little evidence of individuality, though it may possess some merit as a picture of life. A young pianist whose lungs are affected goes to Italy with her friend, who, as soon as she begins to recover, seems bored and neglects her. The Englishman, whose sympathy for the lonely "bride" makes him her faithful companion, is a finely drawn type, though not without a touch of caricature. The ease with which he wins her from the other man, when he discovers their true relation, is somewhat surprising, and the letter in which she announces to her lover her marriage to Eliot, and at the same time assures him of her unchanging affection, is a curious document. The attitude of both is characteristic of the matter-of-fact cynicism of their generation.

Of quite another character is the story by Willy Speyer, "Wie wir einst so glücklich waren" (Albert Langen). It has nothing of the analytical spirit of the time, but a strong psychological element and a warm emotional note. From the solitude of his comfortable but joyless bachelor life the hero looks back to the equally joyless solitude of his college years in a strange city, where natural reserve and difference of rank had built up an invisible barrier between him and his fellow-students. One day he accepts an invitation to a party of young people, and suddenly realizes that his student life alone with his books had made him awkward in manner and unsympathetic. In the protégée of his hostess he meets a fascinating young woman, and his heart stirs with the tender passion of immature youth. There is a refreshing sincerity of sentiment in this simple recollection of youthful love, and its note of sadness is felt to be genuine. The author has the gift of visualization.

A. von Ende.

NEWS FOR BIBLIOPHILES.

In 1899 J. B. Gilder collected extracts from some of James Russell Lowell's letters written to the Department of State while he was minister to Spain, and published them under the title of "Impressions of Spain." These and other letters were

first printed—at the Government Printing Office. In "Executive Documents, Foreign Relations," but we believe no list of the volumes containing them has been published. They ought, however, to be included in any extended set of Lowell's works as they are actually the first editions. Lowell reached Madrid August 14, 1877. The following is a list of the volumes, with first and last pages, of "Foreign Relations," which contain letters by him:

1877. Pp. 521-525, three letters, the earliest dated September 27, 1877.
1878. Pp. 764-804, eighteen letters. The selection in Mr. Gilder's book was taken from this volume and the next.
1879. Pp. 935-955, twelve letters. Mr. Lowell was transferred to England and arrived in London on March 7, 1880.
1880. Pp. 887-890, four letters from Madrid, and pp. 479-588, seven letters from London.
1881. Pp. 492-560, thirty-four letters.
1882. Pp. 192-291, sixty-two letters.
1883. Pp. 408-479, twenty-seven letters.
1884. Pp. 214-225, eleven letters.
1885. Pp. 444-449, six letters.

In June, 1885, Lowell returned to America. Extracts from a few of the London letters are printed in Scudder's "Life" but for the most part the one hundred and eighty-four letters enumerated above are uncollected. Many are short, of a few lines only, but others extend to several pages. Replies to his letters, enclosures, and other documents are scattered among the Lowell letters. One of his letters to the Secretary of State, dated London, November 15, 1884, on the subject of "Unclaimed Estates in England," was printed separately, with documents relating to the same subject, as a 16-page pamphlet. There is a copy of this issue in the Boston Public Library.

The Fourth Quarterly Part of Mr. Karslake's "Book-Auction Records," covers the period from June 30 to August 6, 1909, and describes 1,964 lots, besides containing the general index to the volume. The preliminary matter in this part includes a sketch of "Manchester Libraries and Booksellers," by C. W. Sutton, with a view of the interior of the John Rylands Library.

A Catalogue of the Third Dickens Exhibition at the New Dudley Galleries in London, open from August 7 to September 30, has been received. Most of the books were loaned by two London dealers, but a large collection of prints, photographs, and views of places and scenes connected with Dickens's stories belonged to Augustus Ovey. Percy Fitzgerald has supplied an introduction to the catalogue, which contains reproductions of four portraits of Dickens.

On October 11, the Merwin-Clayton Sales Company will sell a collection of Americana, 341 lots, including books on California, Massachusetts, Pennsylvania, and New York, the Indians, Quakers, etc. On October 13, 14, and 15 they sell a portion of the library of Theodore M. Banta of Brooklyn, including about seventy-five lots on genealogy, mostly relating to American families; a collection of books and pamphlets relating to life insurance; local New Jersey and New York history, etc.

On October 15, the Anderson Auction Company offers Americana, including a considerable collection relating to the Indians, American Biography, books on New Hampshire, New Jersey, and New York, an uncut copy of Thomas's "History of Printing in America" (1810), etc.

Correspondence.

NATURE AND SCIENCE.

To the Editor of The Nation:

Sir: A letter-writer in the *Nation* for September 10 concludes that the love of nature for herself is coeval with a comparatively modern estate of science, and makes interesting quotations to illustrate an early lack of appreciation for American scenery. Much the same conclusion is reached by Ruskin in "Modern Painters"; and the public generally seems to have accepted the belief that between our modern temper and the classical attitude toward nature a great distinction is always to be made. The love of nature in her inanimate, elemental, and unhumanized aspects is supposed to be peculiar to Northern romanticism. Eliminate from the art and literature of the North its factor of grotesque imagination, call Shakespeare and Leonardo and Rembrandt pioneers of the scientific and concrete as against the symbolic and abstract imagery of nature, and the case for pure naturalism as a comparatively recent mode in the arts seems a pretty good one. But does it not prove over much?

To my thinking, the opposition between modern and classical types of landscape is somewhat forced, resting as it does upon the fallacy that nature conceived of as apart from man may have an especial dignity and significance in art. The fact that not a single technically independent landscape of purely objective inspiration exists in classic Italian painting is, for instance, supposed to prove that the Italian love of nature was limited to the mere vegetative mood, and that the elemental phenomena had no appeal except in some human relation. I hope, however, by one or two illustrations from Italian landscape painting, abundantly to indicate an appreciation of the most pregnant elemental meanings.

I have said there is no pure landscape which is technically independent in class c Italian art, but there is just one which, although employed as an accessory to a figurative composition, may be entirely isolated from its surroundings, and which mediates perfectly between a modern and a classical mode of naturalism. I refer to Fra Bartolommeo's medallion of an evening landscape, part of the Pitti Resurrection of Christ. The picture is unique for its time in that it has no human action. A pure landscape, it expresses the mystery of twilight with a powerful and entirely objective imagery based upon the mountain scenery near Florence. In all essentials except the technique, which is above him, Homer Martin might have done it. There is no scientific research or inspiration here, but only a simple love for elemental beauty. If you had asked the artist why he did not paint other pictures like it, and independently, he would, no doubt, have answered that it was not customary, and would not be in good form. The only other landscape without action that I know in classic Italian art is a Masolino at Castiglione d'Olona. It is, however, asserted that this is the fragmentary background of a figure composition. But that Fra Bartolommeo did one quite modern landscape proves his close kinship to our own times in pure naturalism, a kinship also proved by the backgrounds to his early pictures, as especially in the surprising Garden of Eden in Mr. Johnson's collection.

A still more crucial test of your correspondent's theory may be found in the landscape backgrounds attributed to Giotto. In the Joachim series in the Scrovegni Chapel at Padua, Giotto paints the sheep runs in actual blazing sunlight. While the figurative composition of this seemingly earlier part of the famous mural series interests the designer much, the treatment of the field shows an even greater range of invention. In one instance the landscape fairly dominates the action—it is a wild scene, and an angel descending to Joachim seems less to radiate the background light and air in mediæval fashion than to be born of its natural substance. And there are other examples in plenty of Giotto's close observation and objective interest, where the cosmic features of nature rather than its ministry to man are concerned. The St. Francis cycle at Assisi illustrates this little recognized side of his genius. I have already spoken in your columns of Giotto's love of trees for their organic character and intrinsic beauty. I call this an elemental feeling. Piero della Francesca and Leonardo have it in abundance, nor is it absent from minor art.

Ruskin has given full credit to the naturalism of Masaccio's landscape vistas. Here, as in Giotto, we have a master who only lacks some knowledge or executive skill in details to be quite as modern as he is classical. It is impossible in Masaccio to separate the active and figurative interest from the elemental inspiration. I can believe that if any examples of true Greek painting of a fully developed sort were preserved to us—or if landscape representation had been complete in the greatest periods—we should possess antique prototypes of Masaccio's feeling for the large effects of natural scenery and of his noble truth and reality. He has the temper of Æschylus and of Pheidias. We should not expect comfort to this belief from our Pompeian or Capuan specimens; for they are decadent or Roman, generally, mere decorative impressions, loosely naturalistic, yet hardly elemental.

Of Leonardo's landscape, almost ignored in criticism, I am tempted to speak at length; but this might give my case away, as Leonardo was something of a modern scientist. Yet as an artist in form he was traditional; so traditional that competent experts dispute his work with Verrocchio's. I need only say that you cannot isolate the Virgin of the Louvre from her wild grotto, or La Gioconda from her background of clouds and peaks. To isolate the portrait or the landscape is to lower the visual tone to its concrete and tangible details. And if you analyze the unfinished Adoration of the Kings, you will find that the artist based the whole structure of his picture on an elemental motive, the tonal relation of two trees in real air and light; and that from this motive he began—only to relinquish—the impossible task of making his vast conception fully visible. Scientist or not, and I think that he was even more the artist than the scientist, the passionate love of nature for nature's own sake has no higher exponent.

It will be said that I have chosen men of exceptional imagination, and that Leo-

nardo especially is, in his love of nature, a romanticist born out of due time. Let us, then, in conclusion, cite a true romanticist, with a classical habit—Mantegna. It happens that we have, in Mrs. Gardner's collection, an exceptionally naturalistic and "picturesque" specimen of Mantegna, in which the landscape background tells us much of the Italian and, perhaps, of a less traditional temper. An episode in this work is Jerome doing penance under beetling cliffs and near vast antres, while the chief action of the piece, an extraordinarily intimate allegory from the life of the Infant Jesus, goes on amidst the most charmingly domesticated natural surroundings. The composite of Donatellian glyptic ideals, of Virgilian pastoral, of contemporary human feeling, of a picturesque fancy, and of a heightened imagination for natural beauties as objectively envisaged, gives to this picture an inexhaustible interest and a profound historical significance. But all I have space to say here is that on discussing Mantegna's art the other day with one of our ablest American painters he insisted that that artist's chief quality as a painter was the reality of his objective attitude; that even the color in Mantegna, which seems dry and conventional to most of us, was essentially representative; that all we have of elemental generalization in Giorgione and Titian is implicit in the Paduan master—that Titian's landscape, for instance, although often reminiscent of the grandeur of the Cadore, is, to Mantegna's trenchant values in tone, and especially his meteorological sense, merely conventional and "decorative." With all of which I entirely agree.

From concrete instances—and there are many more of them—I must conclude that the love of a phenomenal aspect of nature for its sheer cosmic interest, while it may be enhanced by the revelations of modern science, can hardly be claimed as a monopoly of our own. Moreover, I think it can be said without fear of refutation that the supreme visual interpreters of natural beauty in an objective mode have invariably been men who have not confined their attention to external nature, but have also related its glory to human life. In other words, the exclusive attention to the inanimately elemental in much modern painting, music, and poetry seems a limitation rather than an enlargement of art. We may still learn something of these matters from the Chinese and, *a fortiori*, from the Greeks.

W. R.

Roselle Park, N. J., September 28.

DEMOCRATIC SELF-GOVERNMENT.

To the Editor of The Nation:

Sir: It appears to me that all efforts to reform or rejuvenate the Democratic party should give particular attention to its fundamental principle, which may be stated briefly in present-day terminology as local self-government.

When our Constitution was forming, it was recognized that a popular government had never been able to maintain itself for any length of time, except on a small scale, where the territory was not so extensive nor the population so numerous, but that the interests of all would be practically identical, and the tendency toward disintegration arising from inability to reconcile conflicting interests would be reduced to a minimum. While it was suggested that government by representatives was sufficiently different from pure democracy probably to enable us to avoid the perils of disintegration, still this was not relied upon as a certain solution of the problem. Two methods of meeting the difficulty were, among others, presented. One, which became the fundamental principle of the Federalists, while retaining some of the forms and part of the spirit of democracy, sought to avoid its dangerous tendency by providing for a strong government which would be able to restrain extreme results of dissatisfaction. The other method was that of providing a national government with only such powers as were necessary to maintain itself, and relegating all matters of a strictly local nature to the States, under the belief that friction between different States or groups would be practically eliminated, as there would be few conflicts of interest. The strong government principle was always opposed by the Democrats as tending to oppression of the citizen and undue restriction of liberty, and having an inevitable tendency to increase its strength.

Now, while the Democratic principle is doubtless not an absolute remedy for the ills attendant upon our form of government, experience has shown that it is, generally speaking, applicable to the conditions prevailing in this country, and its application has commonly been attended with good results. The burden of proving that national control is superior to that of the State is thrown upon those who seek to disturb the present equilibrium between State and Federal governments. Our safety lies in seeking and establishing that equilibrium between national control on one hand and local self-government on the other, that will best preserve the permanence of the State and the liberty of the individual. To maintain this equilibrium it is necessary that the Democratic party should revive and nourish this principle—the Republican party will not do so—and if it is not strengthened we may before long reach the condition in which popular governments have heretofore found themselves. Unless the Democratic party does cherish and develop this principle, extending it as far as possible, and putting it into practical application, the national government will continue to enlarge its powers. Already official action has been taken to obtain a national income tax, imposed as it was never intended the national government should impose a tax, and there are well-managed movements for national divorce and corporation laws and uniform State laws on various other subjects. On some of these subjects it may be desirable to have uniformity, when that can be obtained without being more than offset by disadvantages. It is, however, precisely on this lack of uniformity in the legislation of the different States that our permanence as a government was supposed to depend. (For fear of being misunderstood I wish to except matters necessarily national, or matters which have behind them a great moral issue, such as slavery, before which all principles of government must give way.) Hence it is desirable that the Democratic party should take action toward educating public opinion to a realization of the dangers from the present encroachment of national powers, and should also take effective steps toward increasing the activities of the State governments in these matters which are properly under their control.

William P. Malburn.

Denver, Col., September 25.

MR. TAFT AND THE TARIFF.

To the Editor of The Nation:

Sir: In your editorial in the *Nation* of September 23, on "Taft on the Tariff," you certainly cannot be accused of not giving the President due credit for what he has accomplished for the cause of tariff reform. You ask, among other things, "If given duties are found to work injustice or hamper trade, why should they not be changed?" The answer is found in the President's Winona speech, wherein he says that "the interests of the party require me to sacrifice the accomplishment of certain things in the revision of the tariff which I had hoped for in order to maintain party solidarity, which I believed to be much more important than the reduction of rates in one or two schedules of the tariff."

This Machiavelian doctrine, I should say, is the most disappointing feature in Mr. Taft's attitude toward the tariff. The President virtually says that if the wool and cotton schedules are exorbitant and affect every consumer in the United States, it is far better that the people should be unjustly taxed than party "solidarity" broken. In a word, President Taft finds the "interests of the country" so closely bound up with the unity of the Republican party that he accepts Cannon's view that party pledges expire after election.

This is a frank avowal, but very disappointing to those who had supported Taft in the belief that he was not an ordinary politician, and that the true issue would be squarely met, either by a real revision or by a vigorous exercise of the veto power. It would have been far better for the cause of reform to have had a continuance of the Dingley abominations, and thus forced the issue again upon the country, than to have temporized with the current of opinion in the Payne bill. You say the President has done something in forcing "a new attitude upon Republicans." But has he? For the last thirty years the Republican party has at least *promised* revision "after the next election," but now, since the newspapers of the country have made it appear that at least something has been accomplished, even the promise of revision will be abandoned. Apologize as we may, there is no denying the fact that the President lost his first great opportunity of raising himself to the rank of a Grover Cleveland. That opportunity is now past, and while the thinking public admire the President for a general return to constitutional government, there is no desire on the part of that public, especially the West, to return to the ancient régime of American politics. The cold fact is, nothing has been accomplished! And, again, the way is open for the demagogue who, under the guise of reform, shall proclaim himself the enemy of corporate greed.

Karl F. Geiser.

Oberlin College, September 27.

[The question cited by our correspondent related to the possibility of future tariff reduction by means of the Tariff

Commission. On that, we have not yet the President's final word. The adjective "Machiavellian" seems scarcely applicable to a man who blurts out his inmost thoughts, as Mr. Taft often does.—Ed. Nation.]

SCHOOL-GIRLS IN SHAKESPEARE'S TIME.

To the Editor of The Nation:

Sir: Richard Mulcaster's "Positions Concerning the Training Up of Children," 1581, devotes chapter thirty-eight to the subject of the education of "young maidens." In it we have light thrown upon the condition of school-girls in Shakespeare's time, a subject to which Dr. W. J. Rolfe has called attention in the *Nation* of February 18, and again in the issue of July 22. Mulcaster's book was not reprinted until the issue, in 1888, of an almost facsimile edition by the late Mr. Quick, "to whom the credit of discovering this author is mainly due." An "abridged and arranged" edition of Mulcaster's "educational writings," by James Oliphant, 1903, contains the most important extracts from the chapter on the education of girls.

Mulcaster's authority to speak on matters of education for his time is undoubted. With Roger Ascham he was one of the great schoolmasters of his day. For twenty-five years he was the head-master of the Merchant Taylors' School in London, and later, in 1596, he was elected high-master of St. Paul's School. In several respects he was in advance of his age: especially was this true in his assertion that girls had a right to receive as good an education as boys.

He advances and ably supports four reasons why young women should be taught: "That young women are to be set to learning . . . is proved by the custome of our countrey, by our duetic towardes them, by their naturall abilities, and by the worthy effectes of such as have been well trained." The stress he lays in several places upon "the custom of our country" emphasizes the fact that he was contending for no innovation (p. 167, ed. 1581):

Seeing I begin so low as the first Elementarie [in this discussion of the training of children], wherein we see that young maidens be ordinarily trained, how could I seeme not to see them, being so apparently taught? . . . What absurditie am I in, to say that is true which my countrie dare avow, and daily doth trie? I set not young maidens to publicke grammer scholes, a thing not used in my countrie, I send them not to the universities, having no president thereof in my countrie, I allow them learning with distinction in degrees, with difference of their calling, with respect to their endes, wherefore they learne, wherein my country confirmeth my opinion. We see yong maidens be taught to read and write, and can do both with praise: we heare them sing and playe: and both passing well, we know that they learne the best, and finest of our learned languages, to the admiration of all men.

After considering in detail the particularly womanly accomplishments of reading, writing, and "musike," our author, with characteristic conscientiousness, adds (p. 178):

I medle not with *nedles*, nor yet with *housewiferie*, although I think it, and know it, to be a principale commendation in a woman: to be able to governe and direct her houshold, to looke to her house and familie, to provide and keepe necessaries, though the goodman pay, to know the force of her kitchin, for sickncs and health, in her selfe and her charge; bycause I deale onely with such thinges as be incident to their learning. Which seeing the custome of my country doth permit, I may not mislike.

There are sixteen large quarto pages in this chapter. Having considered "the ende whereunto their education serveth, which is the cause why & how much they learne," Mulcaster next tells "which of them are to learne, when they are to begin to learne," and thus progresses to "what and how much they may learne." Finally (p. 182):

There is nothing left to ende this treatise of young *maidens*, but where and under whom, they are to learne, which question will be sufficiently resolved, upon consideration of the time how long they are to learne, which time is commonly till they be ab ut thirtene or fouretene years old. . . .

Thcy that may continue some long time at learning, thorough the state and abilitie of their parentes have also their time and place suitably appointed, by the foresight of their parentes. So that the time resting in private forecast, I cannot reduce it to generall precept. . . .

Mulcaster does not give us detailed information about the boarding schools for girls, but clearly refers to such institutions as conducted by private enterprise (p. 182):

The places wherein they learne be either *publike* if they go forth to the *Elementarie* schole, or *private* if they be taught at home. The teacher either of their owne sex or of ours. For *publike* places, bycause in that kinde there is no publike provision *but such as the professours of their training do make of themselves, I can say little*. . . .

The awkward and often obscure style of Mulcaster's "Positions" has caused it to be neglected for three centuries, but the value of its facts both historically and pedagogically will claim increasing attention from modern readers.

THE HYPNEROTOMACHIA POLIPHILI.

To the Editor of The Nation:

Sir: It would be interesting to know how Mr. La Farge came to take interest in the Poliphilius (see the *Nation*, August 12 and 26, and September 9). In the Norton collection at Gore Hall, Cambridge, is a copy of the 1545 Italian edition, which bears the autograph notes: "C. E. Norton—Brought from Brantwood. June, 1900"; and "Mine, during my work in Oxford. John Ruskin. Brantwood, 3rd April, 1880." I find no mention of the work in Ruskin's letters to Norton, or, indeed, in any of his published writings. The copy is quite fresh and contains no notes. Mr. Norton, in showing me his copy of the 1499 edition (in 1897), did not mention Ruskin in connection with it. This copy was in his possession (according to his autograph in it) in 1873, that is, during the earlier years of Ruskin's lectures at Oxford; so that he, rather than Ruskin, may have known it first. In 1880, he possessed the French reprint of 1561; but his autographs in the original version of 1546 and Beroalde's version of 1600 bear no date. Ruskin possessed "various copies of Poliphilo" (cf. W. G. Collingwood: "Ruskin Relics," p. 191).

Interest in the Poliphilus extends not only to bibliophiles and artists; it includes the lexicographer. The English version of 1592 "englished" a number of remarkable words—often to be found in no other work—most of which are being incorporated in the "Oxford English Dictionary." A study of these words in connection with the Rabelaisian Italian of the original might prove serviceable to that enterprise; for, to judge by the entries, the work was not read before the appearance of Mr. Lang's reprint (1890), when A-E was nearly finished, and was read very imperfectly then. In evidence of this, I note a few of its strange words: (*a*) those for which this work alone is cited by the Oxf. E. D.—imphrygiated, interstitious, plemmirrulate; (*b*) those in this work which are not entered by the Oxf. E. D.—Conciansture, denticulature, gulature, carpanticall, aquilonal, flamigerous, nextrule; (*c*) those in this work for which a later authority is the first cited by the Oxf. E. D.—perpolyte (four years), pilastrel (twenty-eight years). This list was obtained at random in about fifteen minutes. The work contains enough material of this character to furnish forth a "Dictionary of Hard Words."

THE CLUB BINDERY.

To the Editor of The Nation:

Sir: Apropos of the reference in your "News for Bibliophiles" (September 30) to the Club Bindery, with which the late Mr. Robert Hoe was intimately connected, it might interest the readers of that column to learn that the bulk of the Club Bindery staff upon the closing of that bindery went to the Rowfant Bindery of Cleveland, and that the Rowfant Bindery has been organized by a few bibliophiles of the Rowfant Club of Cleveland to carry forward the work temporarily stopped by the closing of the Club Bindery. T. J. Holmes.

Literature.

TWO BOOKS OF EXPLORATION.

Conquering the Arctic Ice. By Ejnar Mikkelsen. With numerous illustrations and maps. Philadelphia: George W. Jacobs & Co.

A more interesting account of the adventurous and self-sacrificing life of the Arctic explorer, it would be difficult to find. The narrative is not only full of graphic descriptions of scenes and incidents, but it is instinct with the personality of the writer, whose sunny good nature and kindness of heart make it easy for the reader to accept Sir Clements Markham's characterization of Capt. Mikkelsen as "an ideal Arctic commander." The aim of the expedition was not one to excite popular attention—it was not a "dash for the pole," but a simple attempt to solve the long-debated problem as to the existence of land to the north of Alaska in what is known as the Beaufort Sea, the second largest unexplored area in the world. Joint commander with the writ-

er was Ernest de K. Leffingwell of Illinois, who had charge of the scientific work, including surveys of large tracts of the coast and unexplored mountains, and who had been associated with him on a previous Polar expedition. One of the other six who constituted the little band was Dr. George P. Howe of Boston, a Harvard graduate. Starting from Victoria in May, 1906, in a schooner of 56 tons burden, they passed through Behring Strait and, notwithstanding an especially bad season for navigating the ice, reached Flaxman's Island, on the northeastern coast of Alaska, where winter quarters were established. In March Mikkelsen, Leffingwell, and the Norwegian mate with three sledges, twelve dogs, and food for sixty-five days, started over the pack ice northward in search of land.

A chapter which will prove of permanent value to future explorers is devoted to a description of the equipment of a sledge expedition in which the equipments of six different expeditions are given to the most minute details—one man's daily rations being expressed in ounces and tenths of ounces. It was one of the most gallant attempts ever made to solve an Arctic problem. Every conceivable difficulty had to be encountered—rough ice rising in ridges above thirty feet high, deep snow, furious gales, and leads of open water. A frequent incident in the trip is thus described: They were hewing their way through a ridge when

> a large piece of ice alongside of us began to slide, and in a second the whole ridge was in motion. We had to leave it hurriedly and to get our sledges away from the dangerous neighborhood of the pieces of ice which came crashing down on our floe. The ice-blocks were about six feet thick, and it was an awe-inspiring sight to see how those immense weights were moved about. Here a big block of ice, about ten feet long and six or seven feet wide, was rolled over, pushed along, and piled up on the top of the ridge. For a moment it lay still; then a motion in the ice underneath it set it sliding, first slowly, then faster; crushing the ice it went over, hitting the floe hard, tottered backwards and forwards, and then tumbled over with an awful crash. Now and then a noise like that of a big gun was heard close at hand: the floe was cracked and commenced to pile itself up in another direction. Slowly and majestically the two rival flocs slid along each other's edge, grinding, crushing, and piling up ice to a height of about fifteen feet. . . . The floes moved by each other with a relative motion of one foot in twenty seconds. The pressure ceased about twenty minutes later, as suddenly and with as little warning as it had commenced, and we had to do all the work of breaking a road over again, chopping and shovelling to make a passable crossing.

The wide lanes of open water were crossed by means of a skin raft, but Capt. Mikkelsen recommends as still better a rail-sledge with a high bow wrapped snugly about with canvas. When tent-bound by a strong wind "some of the time," he says, "we talk, making plans for new trips, or trying to find some other cheerful subject, but it is not always easy, and conversation flags. We have each a small book—'Hamlet' and 'King Lear'—and the reading and discussing of mysterious passages help to pass many an hour which would otherwise be spent talking over our gloomy prospects." After a sixty days' struggle, during which they went two degrees north of the coast, taking frequent soundings and observations, the accuracy of which it was often difficult to verify on account of the movement of the ice—from five to ten miles a day—they were at last "home again!"—that is, at their winter quarters. The scientific results of the trip are thus modestly given:

> One of our purposes had been attained: we had ascertained the extent of the Continental Shelf, and even if we felt a little sorry that we had not found the land we had so implicitly believed it, it was a consolation for us to know that to prove the absence of land was of as much *scientific* value as to find it!

It was Capt. Mikkelsen's wish to make another attempt to solve the mystery of the pack ice the next season, but the impossibility of getting a third man made him give it up. As a last endeavor he tried to get natives to go out on the ice with him, but no one would listen to him. The Eskimos for generations have had the greatest fear of pack ice. So leaving Mr. Leffingwell, who wished to remain another year to complete his scientific observations, he started in October on a 3,000-mile journey, a large part on foot, in the depth of winter, for civilization. His route was eastward along the coast, and then overland through rugged and mountainous stretches, up the highway of Alaska—the Yukon—to Fairbanks, and from thence by stage to Valdez, which was reached the middle of March. The chapters describing this remarkable journey, during which the lowest temperature registered was 58 degrees C., are perhaps the most interesting, if not the most valuable, in the book, as they give vivid pictures of life at the various stations and settlements. The impression left of the condition of the Eskimo under American rule is decidedly good. Many instances are given showing the wholesome influence of the missionaries, teachers, and government officials. The name by which the expedition is known—Anglo-American Polar Expedition, is due to the fact that grants in aid were made by the Royal Geographical Society and the American Geographical Society. The cost was $26,400. Two slight errors have been noted—Collingson for Collinson, and Serah for Sherard Osborn. The nearly two hundred illustrations, reproductions of photographs, add much to the value and attractiveness of the book, and it is to be regretted that there was not a better map showing the route of the expedition. In appendices are printed some extracts from letters written by Mr. Leffingwell, giving some interesting details of the expedition not found in the narrative, and some medical notes of northern Alaska by Dr. Howe.

The Journal of an Expedition Across Venezuela and Colombia. By Dr. Hiram Bingham. New Haven: Yale Publishing Co.

Dr. Bingham left Caracas on January 3, 1907, expecting to complete his journey in two months. But owing to the slowness of pack oxen and mules, unexpected delays from the treatment of native diseases, dishonest Indian guides, and flooded streams, 115 days elapsed before he reached Bogota. Although travelling among half-civilized people the cost of the trip was rather high, the pack animals, provisions, and incidental expenses between the two capitals costing about $1,600. He concludes: "It is hard for the North American to understand the Venezuelan or Colombian, to realize the difficulties under which he labors, to estimate justly the enervating effect upon successive generations of damp tropical heat. Nevertheless, a six months' acquaintance with the actual conditions of life in northern South America has given me, as it must any one who travels in those regions, a keener sense of the ability and courage displayed by Bolivar, Santander, and the heroes of the Wars of Emancipation, and a better appreciation of the achievements of their successors."

These difficulties of climate and route are an essential part of Dr. Bingham's story, for his expedition was made specially for the purpose of exploring Bolivar's celebrated march of 1819 and the battlefields of Boyacá and Carabobo. Bolivar's achievement, in the face of superior numbers of the enemy, has been held by Spanish-American historians to be as remarkable as the more famous marches of Hannibal and Napoleon, and after following the same route from Caracas to Bogota, Dr. Bingham concurs in this opinion.

While the historical element in Dr. Bingham's diary is always dominant, yet other interests are by no means excluded from the narrative. His style is always vivacious, and the scenes along the trail are vividly portrayed, as he descends from the mountains of Caracas to the half-flooded llanos, struggles for months over rivers and across torrid barrens, and at last gradually ascends the foothills of the Andes to the chilly plateau of Bogota. One little picture in words may be quoted as an example of his manner. He is in a monastery:

It makes one feel as though one were living in the middle ages to hear the monks laughing, singing, and talking in the garden, while one, the most learned of all, seated in a dark corner of the great room lined with specimens of his craft, reads aloud from a scientific treatise. It was a picture for an artist to see. The man with only his long, flowing beard, his brown, coarse cloth robe, tied with a rope, and his picturesque sandals, reading in a gentle voice from a page dimly lighted by a single candle.

That Dr. Bingham is not an ornithologist may be known from his speaking of toucans as if they were hornbills; and indeed science is throughout the story a secondary interest. Yet his observations in the fields of geography and ethnology have considerable value. Nor is zoölogy wholly neglected: the photograph of a jabiru perched with its half-grown young on its nest (page 73), and the unique picture of a herd of eight capybaras squatting on a steep river bank (page 122), are curious and valuable. Yet it is a pity that some trained naturalist did not accompany the expedition.

Two short appendices give an historical sketch of the war of independence and the battle of Carabobo, and a third presents observations on temperature and weather.

CURRENT FICTION.

Stradella. By F. Marion Crawford. New York: The Macmillan Co.

This is a slighter and more conventionally romantic tale than its posthumous predecessor, "The White Sister." Its hero is, of course, the Neapolitan seventeenth-century singer and composer; and Crawford found the episode as here recorded, though not as here embellished, in certain old chronicles of the period. The embellishments play a large part, and are of the mildly exhilarating sort which recognizably belong to "historical romance." There are many rumors of peril and much talk of death by cold steel. The pair of bravos who figure so prominently in the action are understood to be desperate fellows, and their designs upon Stradella and his sweetheart are of the most ferocious. But their rapiers are only permitted to execute a pin-prick or two, and the most serious result of the violence threatened and attempted in the course of the story is a broken nose. These two professional gentlemen of adventure are constructed after a somewhat old-fashioned recipe: the humor of them is due to a broadly physical antithesis. In character and antecedents they are pretty much alike—gentlemen who have lost their fortunes, and have eventually become the instruments of private vengeance. But one of them is blond, stout, pug-nosed, truculent, while the other is dark, thin-beaked, and sinister. The complications into which their trade brings them in relation to the runaway musician and his runaway bride are sufficiently amusing. No one of their contracts can be fulfilled without vitiating the rest; in the end, of course, they are all set at naught by the god who presides over romantic fiction.

The narrative has the familiar fluidity and apparent ingenuousness of the great entertainer. Nowhere has been displayed more clearly than in this last (if it be the last) of his tales, his extraordinary faculty of holding his readers' attention by means which appear to have nothing extraordinary about them whatever. At an hour when so many writers of fiction had begun to strain at gaining unusual effects by dint of unusual methods, it was Crawford's distinction to be always simple, colloquial, and direct.

True Tilda. By A. T. Quiller-Couch. New York: Charles Scribner's Sons.

If the late Marion Crawford left behind him his equal in the sheer virtuosity of story-telling, it was in the person of "Q." The one, like the other, has but to open his mouth to let fall a good story, a story round and shining as the pearls of the fairy-tale. The penalty of such facility and adroitness is obvious. The skilled hand can so easily turn out something presentable that it inclines to become less and less concerned with the intrinsic value of the product. We cannot suppose that Mr. Quiller-Couch here, more than Mr. Crawford in his later novels, felt himself under irresistible pressure to tell this story, though to be telling some story pretty much all the time is no doubt second nature to him. But the *improvvisatore* cannot let himself be troubled with the vision of masterpieces: he gets his effect by means of a series of brilliant approximations.

Tilda is a youthful and precocious heroine and *dea ex machina* of the approved modern type. Half guttersnipe, half guardian-angel, she makes her way with impunity over much rough ground and through various ticklish places. When we say that she has no strawberry mark, and does not turn out to be of gentle blood, we do not mean to encourage the reader in the expectation of marked novelty in the plot. The chief object of her exploits is to bring back to his own another waif, who has four lozenges tattooed on his shoulder, and is so proved to be the son of a baronet. But all this is no doubt mere amiable concession to the tastes of the ordinary reader, whose appetite for strawberry marks is apparently insatiable: the plot is simply all that it needs to be. The unlucky thing is the sketchiness and inconclusiveness of the persons. "Q"-land is peopled with creatures of paper and ink as well as of flesh and blood; a large number, more particularly, of figures bearing the mark of "Boz." The minor characters in the present tale are patently after Dickens: Mortimer, a Jingle-Micawber-ghost; Christopher Hucks, a Scrooge-Wegg compound; Doctor Giasson, of Squeers-Stiggins derivation, and so on. It is not so much that "Q," like De Morgan, thinks in terms of the middle-Victorian novelist, as that his brain seems to be persistently haunted by the spooks of Gadshill.

The Compact. By Ridgwell Cullum. New York: G. H. Doran Co.

This book treats of "an unrecorded conspiracy in South Africa" during the interval between the peace of Majuba Hill and the last Boer war. The writer in his preface makes so interesting if partisan a preliminary sketch of the field and the forces that we should be glad to have from him a connected history of this not too often described period. His facts are interesting, his familiarity with his subject obvious, and he writes with spirit. But in working his material into a novel he loses something of his grasp. His plots, though lurid, are sketchy; his conspirators become exclamation points; his details, ejaculations. A more serious fault is the cheaply melodramatic quality of the love-story. For "The Compact" is made, not between Boer and Briton, but by a doting husband who thinks himself unloved, and a former lover of his wife, and its details transcend the ludicrously improbable. Wisely has the author reserved dramatic rights!

As It Happened.. By Ashton Hilliers. New York: G. P. Putnam's Sons.

"The centuries differ in their ways of doing things," observes Mr. Hilliers. "We of the twentieth are diffuse or inclining thereto. I, myself, for example (an humble instance, but the first that comes to hand), propose to run to 400 pages." He keeps his word; but even the seasoned novel reader is content that it should be as it is written. What matters the footfall of time if it treads lightly? As to the diffuseness of the twentieth century, in general, there may be two opinions. Mr. Hilliers, as his book shows, must have been thinking of that latest innovation in novels, the De Morgan revival of the leisurely, the confidential, the discursive. With the author of "Joseph Vance" for father, the author of "Henry Esmond" for grandfather, the author of "Harry Richmond" for godfather, once or twice removed, Mr. Hilliers's "As It Happened" is born into one of the first families of fiction.

The story is of military and domestic adventure in 1778-9, covering, as the map goes, Madras, England, the high seas, and Gibraltar. For scenic settings there are camps, courts, groves, inns,

lodging houses, shipboard, the road. The persons include old soldiers in the India service, young ones hurrying to the defence of Gibraltar, nabobs, adventurers, and scholar-highwaymen. We meet familiarly old Queensberry; Jenkinson, the future Lord Liverpool; Gov. Sir George Eliott. We have glimpses of Walpole, and we hear of Wesley and Reynolds. But one fancies that Thomas Furley, delightful battleground of natural man and saint by acquisition, is the author's favorite among his many characters. The nucleus of the vast matter is the search for the son and daughter of his dead love by Major Wade Justin, who holds in a belt of gems a tidy fortune for them entrusted to him by their scamp of a father dying in India. The preparations are formidable, but once on the journey one is constrained to admire and then to enjoy. The range of information is extraordinary; the fitting of walk and conversation to each character most apt; the humor rich.

REMINISCENCES OF WILLIAM WINTER.

Old Friends, being Literary Recollections of Other Days. By William Winter. New York: Moffat, Yard & Co. $3 net.

This is, in many ways, a delightful book. It is doubly interesting, first, for the intimate personal glimpses which it affords of men who have won popularity and abiding honor in the field of American literature, and, secondly, for the unconscious revelation which it makes of the finer qualities of the author himself, his innate love of the beautiful in art or in character, his rare capacity for ardent friendship, his generous appreciation of the achievements of others, and his fidelity to his own ideals. No one acquainted with Mr. Winter's writings, as poet, critic, biographer, or essayist, needs to be told of the invariable charm of his style. If when judged by the canons of the severest taste, it is now and again somewhat marred by an excessive luxuriance—due largely to the pressure of an overflowing vocabulary—it is, as a rule, remarkable for its flexibility and grace, its incisive clarity, its ready control of the whole verbal armory of humor, pathos, and invective, its felicity in definition and its melodious rhythm. All these characteristics are exemplified liberally in this present work, which is a striking tribute, not only to the dead friends whom he would commemorate, but to his own ability.

Not everybody, it may be said at once, will agree with all the critical estimates, or with all the opinions, which he has here set down. Like most men with strong feelings—especially when endowed, as he is, with glowing imagination—he is apt, perhaps, to exaggerate a little the virtues of those he loves and the defects of those with whom he is not altogether in sympathy. But, as the title itself indicates, this book is warmly appreciative, not coldly critical, and the affectionate generosity that inspires it is one of its many attractions. So full is it of personal anecdote and reminiscence, mostly fresh and almost always illuminative, that it would lend itself readily to long quotation, did space permit. But it is only possible now to refer briefly to its contents. With Longfellow, Mr. Winter was on terms of close and affectionate intimacy, and he pays an eloquent tribute to that accomplished poet and rare gentleman. "A man more noble, gentle, lovable, and true," he writes, "never lived." He ranks him "not among the marvels of creative genius, the portents that dazzle and bewilder, but with the benefactors of mankind that soothe and bless." And this, he argues elsewhere, is the noblest function of the poet's art. With Whitman, as might be supposed, Mr. Winter had little in common. He disposes of him in a perfectly characteristic sentence. "Instead of writing either prose or verse," Whitman, he says, "composed an uncouth catalogue of miscellaneous objects and images, generally commonplace, sometimes coarse, and sometimes filthy."

To Oliver Wendell Holmes is devoted a captivating chapter, in which the personality of the wonderful little doctor is sketched with vivid effect. It shows him at the height of his literary, professional, and social activities, and again, in a tenderly pathetic setting, during the closing hours of his long and productive life. Another charming essay, perhaps, on the whole, the best in the book, is on Thomas Bailey Aldrich, with whom Mr. Winter maintained a life-long friendship. It is filled with the touches that speak of intimate acquaintance, and reveals the inner soul of the man in a most alluring aspect. To the character and genius of George William Curtis also, the author pays fervid and unqualified tribute, declaring that in felicity of speech he was superior to all men of his generation—but this paper, admirable as it is in both spirit and form, smacks somewhat of effort and lacks the spontaneity and delicacy that distinguish the Aldrich study.

The chapter on Dickens is particularly interesting, especially the description of his readings, a subject on which the writer, of course, is an expert, as he proves, in another place, by his illuminative comparison of the oratory of Webster, Choate, and Edward Everett. Of Wilkie Collins, he gives a sympathetic account, dwelling upon the extraordinary courage with which he composed some of his most successful works, while suffering excruciating physical agony. As an author, he places him in almost the highest rank. Letters from Bayard Taylor to Mr. Winter exhibit in a bright light the indomitable self-reliance of that versatile workman, his faith in his own poetic power, and his devotion to high literary ideals without respect to public favor or pecuniary gain. Of the famous little company of the so-called Bohemians, who, under the presidency of Henry Clapp, assembled half a century ago in Pfaff's cellar, Mr. Winter writes with kindly zeal and liberal praise. His sketch of Fitz-James O'Brien bears testimony to that writer's substantial but undisciplined genius. His defence of his quondam associates, as a body, from the imputations of general profligacy cast upon them by uninformed writers is emphatic, and there is a good example of his more acid humor in his reference to certain slighting comments—probably long since forgotten—by Mr. Howells. But the book must be read to be appreciated at its proper value. From beginning to end it is good literature, and if, in the very nature of things, it cannot tell much that is absolutely new, it does throw fresh light upon a group of varied and interesting personalities, and furnishes, in epitome, many illustrations of the analytical, poetical, and descriptive powers of its author.

One Irish Summer. By William Eleroy Curtis. New York: Duffield & Co. $3.50 net.

A Holiday in Connemara. By Stephen Gwynn, M.P. New York: The Macmillan Co. $2 net.

Mr. Curtis's collection of newspaper articles constitutes fair journalism, but a poor book. A great amount of generally trustworthy information about Ireland is conveyed in so fluid a form that the reader can hardly help digesting some of it, if his functions be not deranged by the extreme carelessness of the author's style and his inadequate general education. For instance, the intention and effect of the Wyndham Land Acts is well brought out by description and example, but the discussion is preceded by the following bewildering analysis of the act of 1903:

> That act provides that an owner of a large estate may sell to his tenants the holdings they occupy, and his untenanted land to any one who desires to buy it, in such tracts and at such prices as may be agreed upon, corresponding to the income now derived from that particular property. No landlord can sell a few acres here and there of good land under this act, although, of course, he is at liberty to dispose of any part of his estate at any time at any price that he may consider proper.

Mr. Curtis is afraid of long words and apologizes for speaking of the "Disestablishment." And he is afraid of republican susceptibilities and apologizes for speaking of "civil servants." But he is fearless in other directions and ex-

plains without apology that Cadenus is Latin for dean.

It is noteworthy that books about Ireland are becoming cheerful in tone. While the native is still humorous, civil, and misleading, while his daughter is still lovely, and the landscape, green or barren, is always picturesque, these agreeable features are no longer set off in literature by an invariably gloomy background of famine, drunkenness, and rent-paying pigs. The land is a mere network of beneficent organization. Besides the Congested Districts Board, the Agricultural Organization Society, the Estates Commission, and the Christian Brothers' Schools, there are societies to promote temperance, to preserve the Irish tongue, to teach the English tongue, to loan money, and to drain swamps. If the "Sinn Fein" has the shortest name among these organizations, perhaps the most perspicuous belongs to "Lady Dudley's Scheme for the Establishment of District Nurses in the Poorest Parts of Ireland."

Mr. Gwynn's book is of a different sort. It is written by an Irishman with humor and sympathy and intimate knowledge. It is a special study of Connemara and the Joyce country, famous for trout and salmon and seals, where Thackeray's Fitzboodle had such excellent sport. Mr. Gwynn's account of his successes is of a more sober character as befits a man responsible to the public, but his narrative shows that he too felt the stimulating charm of that lonely coast which forms the westernmost point of Europe. Europe at large and England and even eastern Ireland itself, he tells us, are but names to the men of Connemara, who live altogether by the seashore, on fish and remittances from America. At a small post office, Mr. Gwynn was able to buy none but twopence half-penny stamps, for, as the postmistress explained, all the hamlet's correspondence was with the United States.

An Introduction to Social Psychology By Wm. McDougall. Boston: Luce & Co. $1.50 net.

Professor McDougall's previous work in psychology and psycho-physical theory prepares us to find this essay in the field of sociology an important one, and in this we are not disappointed. He justly holds that the social sciences cannot be well based unless they are made to rest, as thus far they have not been, upon firmly established psychological theories as to the nature of the "springs of action" in man. He contends that there has been too ready an assumption "that men normally and in the vast majority of cases act reasonably," "whereas the truth is that men are moved by a variety of impulses whose nature has been determined through long ages of the evolutionary process without reference to the life of men in civilized societies." In other words, human "springs of action" are obviously in the main instinctive, and are intelligent only secondarily.

With this fact in mind, Dr. McDougall undertakes a detailed study of the instincts, finding ten of a primitive nature to which correspond ten emotional attitudes; for, as he argues at length, our emotions are in all cases the psychic coincidents of instinctive activities. Had he not trusted over much to Baldwin's inadequate "Dictionary of Philosophy," he might have been spared much labor here, for the point he thus emphasizes has already been insisted upon by James, and by other psychologists even more specifically. Following Shand, our author holds that emotional dispositions tend to become organized into systems about the various objects that excite them; and these psychic systems he, with Shand, calls sentiments. The various sentiments which impel us to activity he studies with care, attempting to trace them back to combinations of the ten primitive emotions. His discussion at this point becomes highly technical, and will doubtless be subjected to criticisms from psychological experts: but, in the main, the objections raised will relate to matters of terminology rather than to his principles of analysis, which are sound and often most acute and enlightening. He makes an important contribution in his insistence that an acceptance of his general position carries with it the rejection of the doctrine of the life of societies as merely the sum of the activities of individuals moved by enlightened self-interest, or by intelligent desire for pleasure and aversion from pain. For he agrees with the latest students of algedonics that pleasures and pains are not in themselves emotional, that they are at most accompaniments of activities of an instinctive nature, and are thus themselves only indirectly springs of action; and he shows in detail that happiness is a sentiment—an emotional derivative—and, as such, an instinct phenomenon which cannot by any objective or subjective evidence be shown to be a mere sum of pleasures. It will be evident that in this argument he deals to the utilitarians and other hedonists a heavy blow.

He justly protests against such crude generalizations as that of Giddings, who finds the basic principle of social organization in "consciousness of kind"; showing conclusively that all the attractions of like to like can be traced to the gregarious instinct, and that "consciousness of kind" implies a high level of mental development and a rationalized procedure, which cannot be assumed to exist in the social animals, or in primitive men among whom the social organizations which appear to-day had their inception.

The author's psychology is notably sound, his mode of procedure thoroughly scientific, his illustrative examples happy, and his criticisms cogent and moderate in tone. We shall look forward with interest to his promised volume which is to be devoted to a "detailed study of collective mental processes."

Notes.

An account of "The Chinese," by John Shean Thomson, is promised by the Bobbs-Merrill Co.

"The Day of Days," by Hermann Sudermann, is among the more important novels for October publication by B. W. Huebsch.

Poetry has its place on the autumn list of Paul Elder & Co., in Fanny Purdy Palmer's "Sonnets," subdivided in groups entitled, "California Sonnets," and "Post Meridiem."

A new edition of the Journals of John Wesley, in six volumes, is to be issued by the Methodist Publishing House (London), for which edition the Rev. Nehemiah Curnock has secured a great quantity of unpublished matter.

"The Journal of George Fox," reprinted verbatim for the first time from the original manuscript, is one of the autumn offerings of the Cambridge University Press (G. P. Putnam's Sons).

On the autumn list of Forbes & Co. one finds a new volume of verse by Ben King, "Jane Jones and Some Others"; "What Does Christmas Mean?" by John T. McCutcheon and Jenkin Lloyd Jones, and a volume of University of Chicago stories, "Maroon Tales," by Will J. Cuppy.

The Putnams promise for early publication a volume entitled "The Great French Revolution," by Prince Kropotkin; an account of Alexander Pope and his times, in two volumes, by George Paston; and "Abraham Lincoln—the People's Leader in the Struggle for National Existence," by George Haven Putnam.

"Jesus or Christ," a symposium announced for October publication by Sherman, French & Co., the publishers of the *Hibbert Journal*, has for its collaborators Sir Oliver Lodge, Rev. R. J. Campbell, Rev. James Drummond, Rev. Principal J. Estlin Carpenter, the Rev. George Tyrrell, and Profs. Henry Jones, H. Weinel, and H. Schmiedel. Another October publication of this house is "A Workingman's View of the Bible," by O F. Donaldson.

William Winter's name appears twice on the list of Moffat, Yard & Co. First, we have the "Life and Art of Richard Mansfield," the authorized biography of the actor, and the book for which, we are told, Mr. Winter has been taking notes for more than fifteen years. The Author's Edition of his "Poems" is the other book referred to. These same publishers announce "Kentucky in the Nation's History," by Robert McNutt McElroy of Princeton University; "Women in the Making of America," by H. Addington Bruce· "Henry Hudson," by Agnes C. Laut; "Holland of To-day," by George Wharton Edwards; "The

Survival of Man: A Study in Psychical Research," by Sir Oliver Lodge; "Lays of Democracy," by Charles Edward Russell; "The Conquest of the Air," by A. Lawrence Rotch; and "The Making of the English Bible," by Dr. Samuel McComb. They will also publish on its completion by Miss Laura Stedman the official "Life and Letters" of her grandfather, the late Edmund Clarence Stedman.

Among recent announcements of books for autumn publication we note the following important titles on the list of Longmans, Green, & Co.: "The Meaning of Truth: a Sequel to Pragmatism," by William James; "Liberty and Progress," by C. Y. C. Dawbarn; "The Natural History of British Game Birds," by J. G. Millais, F.Z.S.; "The Common Weal: A Study of the Federal System of Political Economy," by Alfred P. Hillier; "The Cradle of New France; A Story of the City Founded by Champlain," by Arthur G. Doughty, Dominion Archivist; "International Law," by T. Baty; "Letters to the *Times* on War and Neutrality (1881-1909)," by Thomas Erskine Holland; "Turkey in Transition," by G. F. Abbott; "In a Yorkshire Garden," by Reginald Farrer; "The Poems of George Crabbe," edited by Bernard Holland; "Virginia's Attitude Toward Slavery and Secession Defined," by Beverley B. Munford; "A Century of Empire," Vol. I, by the Right Hon. Sir Herbert Maxwell, Bart.; "Garibaldi and the Thousand," by George Macaulay Trevelyan; "Essays," by Father Ignatius Ryder; "Memoirs of Scottish Catholics During the XVIIth and XVIIIth Centuries," edited from hitherto unpublished manuscripts by W. Forbes Leith, S.J. (two volumes), and "Christian Ideas and Ideals," by Robert Lawrence Ottley, M.A., Canon of Christ Church and Regius Professor of Pastoral Theology in the University of Oxford.

Harold Murdock has followed up his intimate portrayal of Revolutionary Boston in "Lord Percy's Dinner Table," with a similar study of a single phase of that city's history in "1872: The Great Boston Fire," published by Houghton Mifflin Co., in a limited edition of 500 copies. Like its predecessor, the present volume blends direct historical narrative with much imaginative detail. Mr. Murdock writes here on the basis of personal experience reinforced and amplified by documentary evidence. An introductory chapter describes Boston as it was on the eve of the great disaster. There follows a series of letters in which the story of the great fire is told with considerable amplitude by an observant, active, and well-informed anonymous citizen, who seems to have retained his sense of humor and of literary style in the midst of the general calamity. A happy sentence or two shows us President Eliot of Harvard watching the progress of the flames and pondering on the future of Harvard's realty holdings. In typography, paper, the noble spread of margin, and binding, the volume is beautifully made up.

The 1905 edition of Oscar Wilde's "De Profundis" (G. P. Putnam's Sons) contained a preface of some four and a half pages, signed by Robert Ross, the editor of the book, and the author's literary executor. In the new edition just issued this preface is reduced to one page, partly by the omission of a fragment of a letter addressed to Mr. Ross "in sending me instructions with regard to the publication of 'De Profundis.'" Of the three paragraphs which made up this fragment, the first opened with the words, "I don't defend my conduct," etc., and is not to be found in the letter as printed on pages 9-13 in the body of the new edition. We are compensated by other fragments, in all, parts of four letters addressed to Mr. Ross from Reading prison. These letters had already appeared, misdated, in Germany. It is worth while to note once more the fact that in Germany and France, "where tolerance and literary enthusiasm are more widely distributed," Wilde's works have been judged independently of the author's character and career. There are added to this new edition, at the end of the volume, two open letters addressed by Wilde to the editor of the London *Morning Chronicle*, on "Warder Martin," and "Prison Reform," respectively.

The chief interest of the reëdition centres, however, in the text of "De Profundis" itself. As one may read in the "Publisher's Note," "the editor has been able to include certain additional matter, aggregating some eighty pages." Nor does it take us long to discover enlargements of the text. The 1905 edition began, one will remember:

> . . . Suffering is one very long moment. We cannot divide it by seasons. We can only record its moods, and chronicle their return.

These same words occur in the second edition, but they are preceded by others. "My place would be between Gilles de Retz and the Marquis de Sade," is Wilde's confession; "I dare say it is best so." He cannot forebear adding: "Nor have I any doubt that the leper of mediævalism and the author of 'Justine' will prove better company than 'Sandford and Merton.'" There are other, and more important, additions to this mordant book. Some of the new material is slight enough, and it is even apparent to the reader that Wilde here expresses himself much more freely and fully than he was allowed to in the first edition of these *fleurs de mal*. "The gods had given me almost everything," he boasts, like another Cain.

> I had genius, a distinguished name, high social position, brilliancy, intellectual daring; I made art a philosophy and philosophy an art; I altered the minds of men and the colors of things; there was nothing I said or did that did not make people wonder. I took the drama, the most objective form known to art, and made it as personal a mode of expression as the lyric or sonnet; at the same time I widened its range and enriched its characterization. . . . I summed up all systems in a phrase, and all existence in an epigram. . . . But I let myself be lured into long spells of senseless and sensual ease.

Only the first and the last of the sentences just quoted are to be found in the earlier edition, nor was there any indication of the omission. There are reasons to suppose that even as it is we have not the entire text as it exists in MS., but we undoubtedly have as much of it as there is any good reason for preserving.

In his "Development of Hungarian Constitutional Liberty" (New York: Emil Zerkowitz) Count Julius Andrássy has written an eloquent and statesmanlike panegyric rather than a history. It is not a systematic exposition, supported by references and allusions to sources. It is rather the work of a man who has consulted and digested every treatise on the subject and expects something like the same sort of knowledge from his reader. It might be said, of course, that references to Hungarian sources would be of little advantage to an American or English reader, as a knowledge of the Magyar language is not common in either country. But, in fact, the most important sources of Hungarian history, and especially of Hungarian constitutional history, are in Latin, which was the dominant literary language of Hungary down to the beginning of the last century. The author is fond of parallels between the constitutions of different countries, and the striking analogies he discovers between the origin and development of Magyar and English progressive constitutional freedom are important and instructive. Thus he enables us to see that both in Hungary and England it was the strength of the monarchical principle and the consequent security of internal order and peace that made progress possible. Count Andrássy shows that the two constitutions had a fundamental similarity, and for centuries followed similar lines of development. The comparison is very instructive and satisfactory, but is likely to cause a little surprise to English authorities on constitutional history. The author neglects to note the somewhat remarkable fact that there was an interval of only seven years between the Golden Bull and Magna Charta, the two documents that are accepted as the foundations of Hungarian and English freedom. But we learn from him that Hungary had her Cardinal Langton as well as England, in the person of Archbishop Lucas. He terrified and humbled King Stephen III in precisely the same fashion in which the English ecclesiastic did King John, and his masterful personality left the Hungarian monarch no alternative but to grant the charter. All this is interesting, and we should have liked it if the author had told us a little more about Archbishop Lucas, who appears and vanishes as abruptly as Macbeth's witches. But the non-Hungarian who would fully comprehend Count Andrássy's constitutional history should first prepare himself for the task by reading a good general history of Hungary. The translation is excellent.

In "The British Tar in Fact and Fiction" (Harper & Bros.), Commander Charles Napier Robinson, R. N., has not only reproduced from his own collection of prints nearly all the hundred and thirty-odd illustrations depicting the character, dress, and habits of the old-time British sailor, but he has added a text abounding in precise information and animated by the liveliest sympathy with his former associates afloat, and with their predecessors who were distinguished alike by their ill-concealed vices and their sturdy, if less obvious, virtues. He has also indicated where other similar collections of the graver's art may be visited, and the sources of a large part of all the knowledge we can ever hope to possess of that fast disappearing type of humanity. This handsome volume gives a comprehensive study of its subject as contained in history, biography, pamphlets, satires, mystery plays, comedies, dramas, sea stories, novels, chap books, poems, songs, doggerel, and pictures from the earliest times. The book is, indeed, a labor of love, representing years of painstaking research, and is an indispensable guide to the sailor in Eng-

lish literature. The index is full, but the list of illustrations lacks the artists' and engravers' names.

The Roman Catholic Quarterly, *Revue des Sciences philosophiques et théologiques*, now in its third year, affords convenient information of scholarly productions in all languages in these two related disciplines. The design is to cover the entire field of both sciences through reviews and contributed articles by specialists. The attempt is made, not only to chronicle the latest results in specific fields, but also to relate each discussion to a larger unity. The *Revue* is thus of value to investigators who differ widely from its point of view, which is that of enthusiastic loyalty to the encyclical of Pius X, *Pascendi dominici gregis*.

The *Allgemeine Zeitung* of Munich has recently discussed, not without uneasiness, the increase in the "learned proletariat." In 1853 there were in all about 13,000 students in the German universities; in 1888 there were some 31,000; in 1909, a total of 51,700. In 1853 there were 30 university students for every 100,000 inhabitants; now there are 75. The increase in the academic contingent has been 119 per cent. since 1880. Bismarck repeatedly tried to check this crowding of the professions, fearing lest Social Democracy should receive its best recruits from the ranks of university graduates for whom the state had no places. Nowadays, with all three classes of nine-year secondary schools turning over their graduates to virtually all departments of the universities, these are more than ever crowded. During the present semester the advance has been particularly notable, every one of the twenty universities of the Fatherland, except Jena, showing a marked increase in registration.

During the present autumn a *Mohammedanisches Seminar* will be opened in Potsdam: the first institution of the kind in Christendom. The courses announced for the winter semester include the following: Arabic, Persian, Turkish and its dialects, interpretation of the Koran, Mohammedan Theology, the Dervish Orders and Sufitic Philosophy, Modern Islam, the Ethnography and Politics of the Islamic Peoples, the New and the Old Testaments in Their Relation to Islam, the Oriental Churches and Islam, Islam and the Ancient Orient. Special attention is to be paid to modern Islam and its confessions, orders, and sects. The cause of the new seminary will be championed by the two Turkish journals founded and edited by Pastor Awetaranian; the weekly *Gunesh* (Sun), and the theological periodical, *Shahid ul Haguaig* (Witness of the Truth). The correspondence of the new seminary is in charge of Dr. R. Wegener, Deutsche Orient Mission, Potsdam, Grosse Weinmeisterstrasse, 50.

A new and timely contribution to the history and progressive development of aeronautics during the last quarter of a century is A. Hildebrand's "Die Brüder Wright," just issued by Otto Elsner in Berlin. It gives, with forty-four illustrations, accounts of the experiments of the German, Otto Leichenthal, who was killed by a fall from his airship in 1896; the Englishman Sinclair Pilsner, who met a like fate in 1899, and Octave Chanute, a Frenchman by birth, who came to America in 1838, when only six years old, and became distinguished as an engineer in the United States, where he published in 1894 a work on "Progress in Flying Machines." Herr Hildebrand represents Wilbur and Orville Wright as the pupils of Chanute. As manufacturers of bicycles in Dayton, O., they were first led to construct a flying machine with a motor, and made successful experiments with this invention in 1903. On October 3, 1905, they were able to fly 38.9 kilometres in 38 minutes and 5 seconds.

The third volume of Mlle. Pellechet's "Catalogue général des incunables des bibliothèques publiques de France," prepared by L. Polain, embraces the alphabetical group Compagnies—Gregorius Magnus. It contains twenty numbers of Ælius Donatus's "De octo partibus orationis," including the so-called Costerian editions, to one of which the tentative imprint "Ultrajecti, imp. du Speculum (?)" is given. Not less than sixty-seven works of Johannes Gerson are listed in 118 editions. Of Dante's "Divina Commedia" we find twelve editions listed.

"Études sur l'historiographie espagnole," by G. Cirot, lecturer in the University of Bordeaux, is a book on the general histories of Spain between Alfonso X and Philip II (1284-1556). It forms the ninth fascicle in the Bibliothèque des Universités du Midi.

A work of considerable display, "L'Empire du Soleil" (Hachette—15 francs), is published on Peru and Bolivia by the Baron and Baroness Conrad de Meyendorff. The authors travelled as artists given over to impressions by the way; and these are rendered by twelve colored plates from water-color drawings of Princess Marie Wolkonsky and others of the St. Petersburg Academy of Painting. There are 111 engravings in the text. A large part of the book is also devoted to attempts at recalling the Empire of the Incas, with its remains scattered over the modern land.

Gustave Danois of the International Institute of Bibliography gives notice of the subscription publication of his "Bibliographie Napoléonienne française" (L'Édition Bibliographique). The work comes down to 1908: its first part will form three large 8vo volumes, double-columned, of authors classified alphabetically from A to Z. The subscription price of each volume is 20 francs (30 francs after publication); and only 100 copies will be printed besides those subscribed for. The first volume is announced for October of this year.

David Henry Cochran, president during thirty-five years of the Brooklyn Polytechnic Institute, died in Brooklyn on October 4, in his eighty-second year. He was a graduate of Hamilton College, and an educator from the age of fifteen.

Edmond Kelly, lawyer, author, and lecturer, died at Nyack, N. Y., on October 4, aged fifty-eight years. He was a graduate of the college and of the law department of Columbia University, and was a master of arts of Cambridge, England. For thirty years from 1879 he made his home abroad, being for a part of that time counsel for the United States embassy at Paris, and, since 1907, a chevalier of the Legion of Honor. Mr. Kelly was a writer on legal subjects, more specifically the law of marriage, and Socialism.

Science.

The English Vegetable Garden: Written by Experts. The "Country Life" Library. Imported by Charles Scribner's Sons, New York. $3 net.

No recent book gives so interesting a contrast between the systems of vegetable gardening practised in England and America. It is easy, of course, to point out where the English system is impracticable here. The long, open English winters resemble those south of Philadelphia, but the uncertain summers are scarcely American at all. Climatic conditions are therefore quite different, and methods cannot be the same in a country where tomatoes and sweet corn, started out of doors, give only the slightest yield. Again, economic conditions differ widely, for all directions in the book are for hand labor. The plough and cultivator are not mentioned. How could an American market gardener profit if his ground had to be worked by hand?

The English system of gardening therefore depends on hand labor and glass. Scarcely a crop is started in the open. Further, according to the apparent agreement of these experts, trenching is an essential to success. Now trenching—or the system of cultivation which turns the surface soil two or, if possible, three feet underground—is not an American practice. To begin with, the process is very costly. More or less according to its capacity for moisture, a cubic yard of earth will weigh approximately a ton. It takes time to turn it upside down, and skill to do the work properly, yet the finished surface is a very small portion of even the smallest garden. Again, the work is slow; few men can work at trenching at a time: they get in each other's way. Finally, trenching, even if for but two feet, results in bringing to the surface a foot of subsoil, to make which fertile means not only lavish applications of manure and fertilizer, but also at least a year of weathering and cultivation. The process, if practised in its purity in America at all, is used either in private gardens, where money is not spared, or by those fresh from the old sod.

From all this it will appear how great is the pains taken to grow vegetables in England. While we have abandoned the old system of plots and borders, and lay out our gardens in long straight rows; while we grow a few windbreaks or put up board fences, and trust to the constable to punish the boys, the English still lay out their gardens in squares, cut out deep alleys in order to make beds, build eight to twelve-foot brick walls, and even discuss the addition of ditches and thorn hedges. This is but the beginning; there is no saving of labor. For instance, the English

gardeners appear to water constantly—and yet throughout the book cultivation seems to be advised merely for the purpose of killing weeds, not for conserving moisture.

One secret of these wide differences is neither in climatic nor economic conditions, but in the great number of English private estates, where vegetable gardens are matters of course, and a good one an object of local pride. Compared with the English we are still nomadic; we doubt if it pays to put much money in a garden which may be abandoned in a few years. But the typical Englishman who settles in the country follows as well as he can the example of the nobleman his neighbor. He expects to buy a vegetable garden with his place, or else he makes it for time, builds walls and plans "quarters" as his ancestors did, and conservatively shuns our innovation of long rows and dusty mulch.

This amount of private vegetable gardening greatly increases the knowledge of it and the repute in which the art is held. As a result, there are in England frequent exhibitions, of which we have but the slightest imitations, serious in our horticultural exhibitions, mere caricatures at our country fairs. The English vegetable gardener rises or falls, professionally, by the prizes that he takes—hence, in this book, the chapter on Vegetables for Exhibition, in which some of the directions are nothing short of amazing. Where in all America are holes made with the crowbar to the depth of three feet four inches (note the exactness of direction!) and rammed full of a sifted mixture of selected composts, all for the mere purpose of growing specimen carrots?

We do not, it is plain, garden as the English do; nor shall we, except after impossible changes, social, economic, and climatic. Nevertheless, we have as yet no reason to plume ourselves upon the perfection of our gardening, as an inspection of the average American home-garden will prove. An increase among us of exhibitions and horticultural societies is to be desired; they will improve our garden practices. Toward these ends a study of foreign methods is helpful, and of books upon the subject few are more direct and practical than the one under discussion. As with all books written by garden experts, we wish that the ignorance of the beginner were more constantly held in mind; yet from the careful methods here outlined the home-gardener can learn ways to lengthen his season. He should also find reason to lengthen his list of vegetables, by the addition of sea-kale, if of nothing else. There is even something to be learned from the English method of tillage; for trenching, if done little by little, adding, say, three inches a year to the depth of mellow soil, will greatly aid cultivation in bringing a garden through a drought, and in getting better crops. While not a guide to the American gardener, to the open-minded this will prove a suggestive book.

The study of the tropical marine fauna of our coasts has been so neglected that only recently a prominent scholar, speaking for American zoölogists, could say that we "know more of the life of the Red Sea than we do of the Caribbean and Gulf of Mexico." Yet we have at our very door a tropical fauna far surpassing in richness that available at the famous marine laboratory at Naples. A leading agency in making known this wealth of life is destined to be the marine laboratory on the Tortugas Islands, one of the projects supported by the Carnegie Institution. Since its establishment, in 1904, a number of important contributions embodying research work undertaken there have appeared, and there is now before us a collection of ten such papers constituting Volume I of "Papers from the Tortugas Laboratory of the Carnegie Institution of Washington." The list well illustrates the broad scope of the work of the station. Special interest attaches to the incomplete memoir on the pelagic Tunicata of the Gulf stream—the last work of the lamented William Keith Brooks. A study by Professor Brooks and B. McGlone, on the origin of the lung in Ampullaria affords an interesting illustration of the manner in which nature may utilize the material at hand for meeting a physiological need. This mollusc is semi-aquatic, and aside from the presence of a well-developed lung, seems closely related to marine forms. Study shows that the so-called lung is a modified gill and that, striking as is the resemblance, it is in no wise related to the lung of the land snails. Dr. Mayer amplifies his earlier work on the nervous control, and the effect of chemical stimuli on the rhythmic pulsation in Scyphomedusæ. He also contributes an interesting paper on the habits and the annual breeding-swarm of the Atlantic palolo-worm, a near relative of the famous edible "palolo" of Samoa. This swarming, which occurs principally within a single night in July, is independent of the rise and fall of the tide, but seems to occur only when moonlight falls upon the rocks. Dr. H. E. Jordan contributes three papers on cytology. That on spermatogenesis treats especially of the morphological and physiological individuality of the chromosomes, and presents additional evidence of a possible relation of the "accessory" chromosome to sex-determination. Professor Edwin Linton presents a detailed study of the intestinal parasites of fishes collected near the station, describing a number of new species. The volume concludes with a description of the peculiar variety of the flagellate protozoan, Anisonema vitrea. Each paper represents a distinct contribution in its field, and much credit is due the director, Dr. A. G. Mayer, who has been untiring in his efforts to develop and to make known the advantages of the station.

The Russian Ministry of Marine is equipping three expeditions to be sent out in the year 1910 to explore the coasts of the Arctic Ocean. One steamship will go from Vladivostok to find its way along the coast of Northeast Siberia from Bering Strait to the mouth of the Lena, and is to spend from three to four years in this task. A second expedition will visit the Taimyr peninsula for hydrographical and topographical investigations. The third expedition, which, like the last, starts from St. Petersburg early in 1910, will follow the land route to the Taimyr peninsula, and will study particularly the courses of the rivers and the geology, climate, and meteorology of the country, establishing local meteorological stations.

The death of Dr. George Edward Post, for many years head of the Medical College in Beirut, Syria, was announced in cable dispatches received September 29. He was born in New York city December 17, 1838, and was graduated from the New York Free Academy, now the College of the City of New York, in 1854. He was a graduate also of the medical department of the University of New York, and of the Union Theological Seminary. Dr. Post was the author of text-books in Arabic on botanical and biological subjects, and was the translator into that language of Butler's "Physiology" and other works. He was also the author of several books in the English language and was a contributor to various Bible dictionaries.

Medical Director Christopher James Cleborne, U. S. N., retired, who died in Washington October 2, was born in Edinburgh in 1838, and was educated in England and in the city of his birth. His medical training was finished, however, at the University of Pennsylvania, where he was graduated in 1860. Dr. Cleborne saw active service in the American civil war, and reached his ultimate rank of medical director in 1887. He has been on the retired list since 1899.

The death of Dr. Anthon Dohrn, founder and director of the biological station at Naples, was announced in a cablegram received at the Smithsonian Institute on September 30. Dr. Dohrn was born at Stettin, Germany, in 1840, and was a pupil of Haeckel in Jena. He founded, in 1870, the Naples biological station, the first institution of its kind, and even to-day one of the most important. Dr. Dohrn was an extensive writer on scientific subjects.

From Colombes comes the news of the death of Arnold Boscowitz, at the age of eighty-two. He was the author of "Tremblements de Terre" (*couronné par l'Académie Française*), and of "L'Âme de la Plante," a book which is said to have suggested to Darwin the writing of his monograph, "Insectiverous Plants." He was also a former writer for the *République Française*, the *Temps*, and other journals.

Drama.

The fifth volume of "A History of Theatrical Art," by Karl Mantzius (J. B. Lippincott Co.), treats "Great Actors of the Eighteenth Century," in Germany, France, and England. The book considers, for Germany, Caroline Neuber, Konrad Ekhof, Schröder, and Iffland; for France, Adrienne Lecouvreur and the School of Voltaire (*i. e.*, Clairon, Lekain, Dumesnil); for England, the Betterton Period, the Cibber Period, and especially, of course, David Garrick. The author tries to bind his material together by

emphasizing in each country the trend in acting toward greater simplicity and naturalness, thus endeavoring to avoid the obvious criticism on most histories of acting, that they rather retail gossip about individuals than make clear the underlying literary or dramatic tendencies of which the actors were but the means, and the most apparent sign. On the other hand, the author hardly tries at all to make clear the effect of an actor of one nation on any actor or actress of another nation. Surely, something might be said on this point in connection with the friendship of Garrick with Lekain, Préville, and Mlle. Clairon. At moments, as when writing of Garrick's Shakespearean revivals, the author is independent and incisive, but as a rule he contents himself with summarizing accepted opinion. As a Dane he knows his German stage more intimately than the French or English; indeed, in treating the relations of the Restoration drama to its sources he shows entire ignorance of the recent research which has proved unsound the time-honored assumption that the Restoration drama is chiefly indebted to France. As an interesting, chatty conspectus the book will be useful to the casual reader; to the student of the stage it offers little save collocation of accepted opinion on the great names of three national stages. The book is freely illustrated with interesting portraits and scenes from plays. Unfortunately, in many cases, the author has had to copy, not originals, but reprints in current books. This, and the process used, too often produce a blurred result. The translation is uneven; usually it is competent, but at moments the pronouns squint badly. And what are a "genius in agitative," and "champagne-hubbling humor"?

Jerome K. Jerome's "The Passing of the Third Floor Back," which was played in this country for the first time on Monday evening in Maxine Elliott's Theatre, attracted a good deal of public attention in London, and will probably meet with success here. It bears a sort of family resemblance to Mr. Kennedy's "The Servant in the House"—introducing a mystical divine figure to illustrate the potency of brotherly love and the spirit of mutual service—but is altogether inferior to that work in general significance and in literary and dramatic quality. In construction, it is a slipshod affair, consisting of a series of episodes, connected by a very flimsy thread of narrative, in which the various characters, constituting the peculiarly mean or vicious population of a third-rate boarding house, are first confronted and then converted by the *deus ex machinâ*, around whom they revolve. It is a primitive arrangement, but the sentiments expressed if somewhat trite, are wholly admirable, while the general moral inculcated is unexceptionable. As a matter of fact, the piece is much more pretentious than it is impressive, the personages being conventional, the machinery conspicuous, and the humor, though often effective, somewhat obvious. But the general motive is sound and the central figure is played by Forbes Robertson with so much distinction of manner, with so much spiritual refinement, and with such persuasive eloquence, that the inferior workmanship does not count for much. He carries the representation through to success by the sheer force of his striking personality and genuine artistic illusion. The cordial reception extended to the representation is one more notable proof of the readiness of the New York public to appreciate and support plays of the most serious purpose, when adequately presented. Its reported preference for the indecent or the lunatical has very little foundation in fact.

Extensive preparations are being made in Berlin for the observance of Schiller's one hundred and fiftieth birthday, which falls on November 10. According to the present plan, a very elaborate programme, consisting in part of addresses and in part of dramatic performances, will be given a few days earlier, probably on November 5, and for this the most distinguished German and foreign actors, authors, and critics, having had to do with Schiller and his works, have been invited.

"Thaïs," a new play by Jean Richepin, will be staged this winter at the Théâtre Français.

Music.

The Orchestral Instruments and What They Do. By Daniel Gregory Mason. New York: H. W. Gray Co.

Boston Symphony Orchestra Programmes. 1908-1909. Boston: C. A. Ellis.

Berlioz, in his Memoirs, relates an anecdote which shows that Richard Strauss was by no means, as so many suppose, the first to demand a mammoth orchestra. One day Prince Metternich said to Berlioz: "Are you not the man, monsieur, who composes music for five hundred performers?" To which Berlioz replied: "Not always, monseigneur; I sometimes write for four hundred and fifty." In reality, he did demand sixteen trombones, sixteen trumpets, and other instruments in proportion, for his Requiem. In this he holds the record so far; but the course of orchestral evolution since his day has brought it about that if six or sixteen instruments of one kind are used in a score, they are likely to be called upon to play each a different melody, or part of the harmony; and this has given to symphonic music a complexity which few but professionals can unravel.

No doubt, just as one can enjoy a picture without knowing how the painter mixed his colors, so one can enjoy an orchestral piece without a knowledge of scoring, or even the ability to name the various instruments. The pleasure can, however, be made much more subtle and intense by familiarity with these things.

The object of Mr. Mason's little book is to assist concert-goers in recognizing the various orchestral instruments (pictures of which are provided), both by sight and by hearing, and to stimulate their perception of the thousand and one beauties of instrumental coloring. He calls it "a primer for concert-goers," and has written it in such a simple and clear style that the veriest tyro can understand and profit by it. On the other hand, there are many hints which will help even veterans by calling their attention to subtleties in orchestral coloring that may have escaped their attention. How, for instance, did Tchaikovsky secure the mysterious sombre effect at the opening of his "Pathetic" symphony? By scoring the music for double-basses in two divisions and bassoons in their low register. Dvorák, at the end of the slow movement of his "New World" symphony, secures a unique effect by writing a chord for double-basses alone, in four groups, one for each tone. There are thousands of such interesting details in the popular masterworks, and Mr. Mason calls attention to many of them, with illustrations in musical type. He advises even beginners to buy the cheap and handy orchestral scores which can now be obtained, read them before, during, and after the concerts at which they are played, and believes that there are few persons fond enough of music to attend orchestral concerts who would not find in a few months their powers of musical enjoyment doubled or trebled in this way.

Another aid to the appreciation of orchestral music consists in the descriptive programmes, which are distributed at most concerts. Deservedly famous among these have been for a long time the programme books of the Boston Symphony Orchestra, bound volumes of which should be in every library, private or public. The volume for 1908-9 comprises more than 1,800 pages of reading matter, and all of it is worth perusing. The present editor, Philip Hale, provides historic and analytical articles on all the pieces played during the season, in which he avoids the mistake of writing technical details which are intelligible to those only who do not need them. Boston audiences evidently like to occupy their minds, even during the intermissions, and for this habit also ample provision is made in the form of literary "Entr'actes and Excursions." These are usually by Mr. Hale himself, but many are cited from newspapers and periodicals. In the present volume, one may find, among many other good things, articles on Liszt and the term "symphonic poem," the symphony before Haydn, Bülow's last letters, the drum, the legend of the Flying Dutchman, Goethe and music, Smetana's deafness, Hugo Wolf, music in Finland, Rubinstein's hard music and charity, etc. There is hardly a musical periodical which provides so much good miscellaneous reading matter as these programme books.

Among the compositions to be heard for the first time here at the concerts of the Russian Symphony Society will be Aren-

sky's "Egyptian Suite" and variation for strings, Borodin's Unfinished Symphony, Balakireff's "Islamea" and Symphony No. 2, Glazunoff's Symphony No. 2 and "Chopiniana," Liadoff's "To Maeterlinck" suite and "Tales of Olden Times" ballade, Liapunoff's "Ballade," Musorgski's "Tableaux" suite, Rimsky-Korsakoff's Introduction to the Fairy Tale "Golden Hen," Scriabine's Symphony No. 2, and Tchaikovsky's Overture and Air de Ballet from "Voyevoda."

Among the novelties promised for this season by the Philharmonic are Debussy's three nocturnes, "Clouds," "Festivities," and "Sirens" (the last of these calling for a chorus of women's voices); Pfitzner's "Mährchen" overture and "L'Apprenti sorcier," and Gustav Mahler's Seventh Symphony, which has never been played in this country.

The Olive Mead Quartet, with its personnel unchanged, will give two recitals this season at Mendelssohn Hall. Heretofore their recitals have been given on Thursdays; but this year they will take place on Wednesday evenings; the first on December 1, the second on February 23.

Frederick Russell Burton died on September 30 at Lake Hopatcong, N. J. He was the writer of "Shifting Sands," "Her Wedding Interlude," "The Song and the Singer," "Strongheart," etc., and the composer of "Hiawatha," "The Legend of Sleepy Hollow," "Songs of the Ojihway Indians," etc., and was a writer for the New York *Sun*. In the last issue of the *Nation* was announced his forthcoming "American Primitive Music," which was described as "probably the first detailed treatment of Indian music." Mr. Burton was forty-eight years old, and a graduate of Harvard College.

Art.

The late William J. Anderson's "The Architecture of the Renaissance in Italy," fourth edition revised and enlarged, is imported by Charles Scribner's Sons. More than seventy collotype and other plates besides one-hundred-and-ten text illustrations make this one of the most useful manuals of its sort. The editor, Arthur Stratton, has done well perhaps to refrain from enlarging the text substantially—virtually a critical essay on the chief monuments. The book has become standard. Its limitations were most intelligently chosen. Personally we should be glad to find a word on Vitozzi's extraordinary elliptical dome at Vico in Piedmont. Such works attest a surprising vitality of the Roman tradition even in decadence. We feel also that one or two of the most perfect villa compositions, including gardens and terraces, might have been included. In fact it might have been well to trace briefly the growth of the dogma of *ensemble* which was most fully exemplified later and in France. Whether one likes to admit it or not, such compositions as the Villa d'Este and Versailles—to takes extremes—are among the most original expressions of modern architecture. It is almost the only idea we have worked out afresh. The pity is that the growth of the idea of *ensemble* corresponded with the decay of fine architectural craftsmanship. The past has refused us the desideratum of a personality including a Peruzzi and a Mansart; the future might conceivably produce it. The author's vindication of the essentially national and original nature of Italian Renaissance architecture has ceased to be novel. In view, however, of the persistence of a diffused Ruskinism, and of the constitutional incapacity of the plain man to realize that just fine proportions will make fine architecture, our author's moderate views retain their value. This volume is serviceable precisely because it enables a studious layman to see a class of fine but unappreciated monuments through the eyes of a cultured architect. In successive reprintings the bibliography has fallen discreditably behind the times.

"L'Art et les moeurs en France" (H. Laurens) is an octavo volume, with twenty-four inset plates, composed by a number of living French critics, and with a preface by André Michel of the Louvre Museum. Callot and the brothers Le Nain; the Huguenot Abraham Bosse, who threw so much light on the interiors of seventeenth-century homes; Watteau and Fragonard; Chardin and Bouchardon, painters of the *bourgeoisie;* moralizers as the Revolution approached like Greuze; street and portrait-painters of the Revolution; Gavarni and Daumier; Manet and Alfred Stevens, revealing the Second Empire; Fantin-Latour and his models of our time—pass in successive chapters.

To the thirty-four canvases by Rembrandt shown at the Metropolitan Museum's loan exhibition have now been added three more, purchased by Benjamin Altman from the collection of Maurice Kann, brother of that Rodolphe from whose collection came Mrs. Huntington's great Savant. The finest of the three is the Magdalena van Loo, The Woman with a Red Pink, long in the possession of the d'Oultremont family in Brussels, which Dr. Bode, the accepted authority on Remhrandt's works, places in the 1622-5 period and describes thus:

> The woman with the pink with her dreamy eyes and sympathetically thoughtful expression, in the splendor of luminous red, the masterly modelling of her face, her magnificent parure of pearls and diamonds, the full warm light concentrated on her head, but casting magical reflections into the surrounding shadow, may be fairly called one of the most beautiful of Remhrandt's female portraits.

This Magdalena was the wife as well as cousin of Titus van Ryn, Saskia's son, and Titus is believed to be the original of The Man with a Magnifying Glass, which, with The Auctioneer, is also lent by Mr. Altman.

The Graphische Gesellschaft is to issue, with a short text, an exact reproduction of the so-called "Tarocchi." The aim of the fifteenth century artist in this series of Italian copper engravings was to convey instruction in his representations of the various ranks and conditions of human life, and, no less, to afford delight to the amateur. In fact, two series exist, and their relation is disputed; it is proposed to reproduce both, side by side, by heliogravure, in the exact size of the originals. There will, then, be one hundred reproductions on fifty plates; and the price is fixed at £3 per copy (boards). The work is promised for 1910. After publication the price is to be £5.

Otto Henry Bacher, a fellow student of Whistler, and an artist and illustrator, whose death has just been announced, was born at Cleveland, O., March 31, 1856, and secured his artistic education in Munich and Paris. He recently published an account of his residence, "With Whistler in Venice," and etchings made by him of scenes in that city and in Bavaria earned for him a considerable reputation. He was a member of the English Society of Illustrators, Painters, and Etchers, and of the American National Academy.

Jules Adeline, the Rouennais etcher, whose death at the age of sixty-four years has been recently reported, was a pupil of Henri Somm. M. Adeline was an accomplished writer as well as an artist. Another French artist whose death has been announced is Louis Courtat, a pupil of Cabanel, and chiefly known for his religious paintings and his portraits. One of his best portraits, that of Mlle. George, hangs in the foyer of the Odéon.

Finance.

THE RISE IN THE STEEL SHARES.

During several months, but especially during the fortnight past, the Stock Exchange has been witnessing what was in some ways one of the most extraordinary movements in the price of a single stock that Wall Street history has presented. Last Monday, the common stock of the United States Steel Corporation sold at 94⅞. Its highest price of the preceding week had been 92⅞; of the week before that, 86¼; of the week before that, 84¼, and of the week before that, 80⅜, and each of these figures had established a new top price in the history of the stock, whose highest price, indeed, up to a year ago, was 55. During the six business days of last week, more than one hundred and fifty separate stocks were dealt in on the Stock Exchange; but out of the total number of shares (5,260,000) which changed hands, or were represented as having changed hands, more than one-fifth, or 1,200,000, were shares of "Steel common." In the preceding week, something like one-fifth of the aggregate sales of shares were again made up of "Steel common"; the week before the percentage was also one-fifth.

In the second week of August—the week of the "segregation rumors"—when it was commonly said that Union Pacific made up the whole of the market, the sales of Union Pacific stock were less than one-tenth the total number of shares of all stocks dealt in. In the culminating week of Wall Street's famous "big time" in 1901, when the speculating public went wild to a degree never witnessed before or afterward in our history, when their excited buying converged on the Steel shares

as on no others, and when a $25,000,000 "underwriting syndicate" was notoriously manipulating those shares for "distribution" purposes, transactions in "Steel common" constituted scarcely one-tenth of the total, and the average daily trading in the stock was close to the daily record reported this present week. The simple spectator may be pardoned, then, for asking what has actually happened in the case of "Steel." Who is it that is rushing so impetuously into Wall Street to "buy Steel," causing the tape repeatedly to record the sale, in single blocks, of 4,000 or 5,000 shares? What sudden accession of earning power has come to light, as a result of which the common stock of the company is worth 60 per cent. more than it was in any of the eight years of its history, up to 1909?

These are legitimate questions. Usually, when so spectacular a display occurs in Wall Street, one of three explanations is forthcoming. Earnings, published and seen by every one, may have increased at a pace remarkable enough to guarantee large increase in dividends, as in the case of Union Pacific's rise from 138 to 195 in 1906. A valuable part of a company's property, hitherto unproductive, may suddenly have been made subject of a "deal" of which shareholders got the benefit—which was the cause of Great Northern's rise from 275 to 348 in the same year. Or, as a third possibility, a contest for control of the property, regardless of the price, may have been in progress, such as sent up the price of Northern Pacific stock, in three months of 1901, from 77 to 1,000.

None of these three explanations applies, so far as the investing public has any information, to the movement in "Steel common." Its trade is admittedly reviving rapidly; but its latest quarterly report, the most favorable submitted since the panic, showed net earnings less by 50 per cent. than in the corresponding quarter before the panic of 1907. It has no property for disposal; its assets are manufacturing plants which it needs for its own business. The "contest for control," if it can so be called, is believed by Wall Street to have occurred and to have been terminated during the panic of 1907, when the interest now dominant in the company's affairs apparently picked up at bottom prices the Steel shares thrown over bodily in their hour of individual distress by the interests then controlling. The explanation of the present market, therefore, still remains to be discovered.

It is on this absence of any visible and legitimate cause for the remarkable movement of prices that the bewilderment of some observers, the admiration of others, and the skepticism of still others, are based. Such feelings are at least in some degree emphasized by what must frankly be declared to be universal disbelief that Steel shares have actually been bought and sold, in the usual acceptation of those words, in any such quantity as the ticker seems to testify. The notion that, when the tape records such transactions, immensely wealthy men are buying a stock to hold, out of their private fortunes, was shattered once for all by the disclosures after the markets of 1901. The idea that foreign capitalists are buying, regardless of the price, has to meet the fact that an effort to get the stock floated on the official Paris market, clearly for such purposes, failed this summer through the French government's refusal of the "listing."

There would apparently be left the theory that earnings so prodigious, and dividends so great, as to justify the present abnormal prices, are in the not very distant prospect, and that there are people ready to carry an immense and increasingly expensive burden on the basis of borrowed money. It is a fact that the present activity in the country's steel and iron trade, so far as concerns the volume of production, is to-day at the maximum of its history. But the same thing could have been said of the industry in 1906, when "Steel common" was paying 2 per cent. annual dividends and the stock was selling between 32 and 50, and in 1895, when the sudden replenishing of supplies, a familiar incident in the first recovery from the distrust and enforced economy of every great financial crisis, brought iron production to a maximum never before attained, and not attained again for nearly two years. In other words, this argument is based on expectation, not certainty, and it does not in the least explain why such belief should have been adopted overnight, as it were, after half a dozen years of continued disbelief. These are the factors thus far in view in a very extraordinary Stock Exchange operation, regarded by the majority of experienced men with a mixture of feelings, in which distrust of the resultant state of the stock market certainly has a part. It is scarcely strange that when, on Tuesday of this week, "Steel common" suddenly broke 4 points on heavy realizing sales, a shiver of apprehension should have spread through the Stock Exchange.

BOOKS OF THE WEEK.

Alexander, D. S. A Political History of the State of New York. Vol. III. 1861-1882. Holt & Co.

ISSUE THIS WEEK

Letters from G. G.

These letters excited wide and enthusiastic approval as they appeared this year in the *American Magazine*. They tell the story of a refined, discerning young woman forced to earn her living by brush and pen. Underneath their surface sparkle lie deep feeling and kindly philosophy. The constantly shifting scenes include Paris, Florence, New York, Cape Cod, and Florida.

(223 pp. 16mo. $1.00 *net*. By mail $1.06.)

Travels of Four Years and a Half

In the United States of America (1798-1802). By JOHN DAVIS. With introduction and notes by Alfred J. Morrison.

This quaint book, first published in 1803, had been out of print. It is not only invaluable to the collector of Americana, but combines a vivid picture of our early days with a delightful unconscious drollery.

Trevelyan in his "American Revolution" says of this book: "Among accounts of such voyages, none are more life-like; an exquisitely absurd book, which the world, to the diminution of its gayety, has forgotten."

(429 pp. 8vo, $2.50 *net*. By mail $2.65.)

THE CLEVEREST BOOK OF THE YEAR
ANNE OF GREEN GABLES
By L. M. MONTGOMERY

Madame, Mother of the Regent
By ARVEDE BARINE
Author of "La Grande Mademoiselle," etc.
8vo. Fully Illustrated. $3.00 net.

The Princess who, during the latter portion of the reign of Louis XIV. was known par excellence in France and throughout Europe as "Madame," was the second wife of Philippe of France, known as Monsieur Duc d'Orléans, the younger brother of Louis XIV. The record of her long years in France is full of dramatic incident, and the book shows the same power and skill in delicate and accurate characterization of the persons referred to as gave such distinctive interest to Arvède Barine's two earlier volumes on "La Grande Mademoiselle."

CHRISTIAN IDEAS AND IDEALS
An Outline of Christian Ethical Theory. By ROBERT LAWRENCE OTTLEY, M.A., Canon of Christ Church and Regius Professor of Pastoral Theology in the University of Oxford.

***This book contains the substance of lectures addressed to candidates for the ministry, together with three supplementary chapters on various points of social morality.

LONGMANS, GREEN, & CO., New York

The Musicians Library
Handsome booklets *FREE*, containing portraits of Editors, complete descriptions and tables of contents of 50 Volumes.
Special rates to College, School and Public Libraries.
OLIVER DITSON COMPANY
DITSON BUILDING, BOSTON, MASS.

FOR SALE
Ten volumes of the works of Benjamin Franklin—being set No. 171 of the fine edition issued by G. P. Putnam's Sons in 1888.
These are very handsome books, printed in octavo volumes of five hundred pages each; excellent quality of paper and press work; pica type, and tastefully bound in half leather, gilt top. Price $60. Address Box 55, West Chester, Pennsylvania.

BINDER FOR THE NATION
To receive the current numbers in a convenient (temporary) form. Substantially made, bound in cloth, with THE NATION stamped on the side in gold. Holds about one volume. Papers easily and neatly adjusted. Sent, postpaid, on receipt of 75 cents. Address The Nation, 20 Vesey Street, New York City.

The Nation.

NEW YORK, THURSDAY, OCTOBER 14, 1909.

The Week.

"I like to affirm that I am an optimist," said the President in his speech at Berkeley. And yet if there is anybody in the length and breadth of this optimistic country who has less occasion than any other to make this affirmation, we should say it is William H. Taft. His unfailing smile has become as familiar a national landmark as were some of the facial characteristics of his eminent predecessor, who himself was nothing if not an optimist. All Americans are optimists, and all American public men are *ex officio* optimists of the first class. To be sure, there is optimism and optimism, and its manifestations differ from man to man. That Mr. Taft is a straight-out optimist was sufficiently established even before he had to pronounce the tariff bill very good; since then anybody who would doubt it must be compact of skepticism. The one exception that we can recall to the steady domination of optimism in the high places of our nation for many years past was furnished by Grover Cleveland; and none of his triumphs was more remarkable than the extraordinary hold he maintained for many years on popular sentiment, in spite of his frequent striking of a non-optimistic note—a hold only broken when the panic of 1893 made everybody more or less of a pessimist for the time being, and thus perhaps put an extra premium on optimism.

There is cause for national congratulation in the fact that Mr. Taft, while visiting the Yosemite Valley last week, was accompanied by John Muir, who thus had abundant opportunity to talk to him about San Francisco's proposed conversion of the Hetch-Hetchy Valley into a water-tank. Not only has Mr. Muir made our national parks his home for many years, and written books about them, but it was largely through his efforts that some of these parks were set aside as playgrounds and holiday resorts of the American nation. It was at his instance that the Hetch-Hetchy Valley, which some nature-lovers, including the landscape painter, William Keith, consider even more picturesque than the Yosemite, and the turbulent upper waters of the Tuolumne were added to the Yosemite and the whole declared a national park. The grant was unfortunately worded in a way which made it possible for Secretary Garfield to permit San Francisco to covet the Hetch-Hetchy, and the next Congress will be asked to take away this superb valley from the nation and make a present of it to the city, which, as eminent engineers have shown, does not need it, as it has thirteen other available sources of good water. The grant, if made, would exclude campers and sightseers not only from the Hetch-Hetchy, but from virtually one-half of the national park. "Dam Hetch-Hetchy!" exclaims Mr. Muir indignantly. "As well dam for water-tanks the people's cathedrals and churches, for no holier temple has ever been consecrated by the heart of man."

Dr. Cook might confer a favor by explaining one disquieting point about his observations. The determination of the latitude, day by day, with a very fair degree of accuracy, offered no special difficulty, granted that he had satisfactory means of getting the horizon; but how he could ascertain the longitude with any sort of approach to precision, unless he devoted a very great amount of pains and time to it, seems a mystery. With his chronometer reading Greenwich time, nothing can be simpler, to be sure, than to determine the longitude by noting the time of the chronometer when the local time is noon; but how to tell the moment of noon when you are within striking distance of the Pole—there's the rub. At a latitude of 88 degrees, for instance, the elevation of the sun varies by only two degrees in the course of six hours; to determine the precise time when that elevation is greatest needs an extremely delicate operation, and yet an error of one minute of time in the determination of noon means an error of fifteen minutes of longitude. In the face of all this, we find Dr. Cook setting down his longitude as well as his latitude to the minute; and he leaves us in no doubt that the longitude was determined by astronomical observation. The very day before the Pole was reached, he says: "The observation gave latitude 89 degrees 46.5 minutes, longitude 94 degrees 52 minutes"; and, finally, in describing the capture of the Pole itself, he tells us that "the sun indicated local noon," leaving us to imagine what possible thing that may mean.

Such a point as this, which on its face tends to discredit his whole story, should be cleared up at once. Three months must elapse, according to Dr. Cook's recent statement, before his evidence is ready for submission. Meanwhile he is utilizing this period of suspended judgment on the part of competent critics to transmute into very handsome profits the uncritical enthusiasm of the multitude. That this is not a situation in which a man of a delicate sense of honor would be willing to place himself goes without saying; but the public, and the organs of public opinion, have, perhaps, no concern with the question of Dr. Cook's standards of propriety in such a matter. But they are concerned with the possibility that the public is being exploited—that it is being led into delivering both honors and dollars without due warrant. And the time seems plainly to have come when, without in the least prejudging the case, a protest should be made against any further continuance of this suspense. Dr. Cook has finished the publication of his serial newspaper story; he has given a number of lectures in various parts of the country, at high admission prices, to great audiences; now let him address himself to the task of establishing his case to the satisfaction of competent and impartial inquirers.

Before the Pressed Steel Car Company's strike is wholly forgotten, it is only just to record the commendation given to the Pennsylvania constabulary for their services at McKee's Rocks. As usual, the constabulary had a number of men killed and wounded—which seems to happen in almost every great strike attended by violence—and this led to arbitrary measures in arresting and disarming strikers. Before the end of the affair, however, strikers and constabulary were playing baseball together;

and it is gratifying that Mr. Rufus D. Smith of the Pittsburgh Associated Charities has only praise for the State police. In a recent review of the whole episode, he writes that the arbitrary and rough methods of dealing with the strikers alone prevented further violence. "On the other hand," he says:

> The State constabulary did its work efficiently, and was heartily glad when the strike was over. The men were young, clean, disciplined, and of a high calibre. This body consists of picked men, with previous army training, always in good condition, and ready for action. In the thickest of the fight precipitated by the rashness of the deputy sheriff . . . the troopers, even when surrounded by a fighting mob of men, were careful where they shot.

Pennsylvania, being the State of strikes, is peculiarly in need of a body of excellent men like this. Its cost must be offset by the many dollars the State would have had to pay for militia policing—always more expensive than constabulary, because of the inexperience of the militia. A similar constabulary is greatly needed in other Northern States, and in every Southern one; but so far they have been inexcusably slow in following suit.

Four years ago, the disfranchisement proposal known as the Poe amendment was defeated in Maryland by an overwhelming majority. This year an amendment having the same purpose, but drawn on somewhat different lines, is before the people for ratification, and bids fair to meet the same fate, though the majority against it cannot be of the phenomenal magnitude that was obtained in 1905. In that campaign a very large proportion of the voters opposed the amendment out of fear that, while primarily aimed at the negroes, it put into the hands of the registrars a power of disfranchisement which might be used against any class of voters hostile to the ruling party. This was due to the fact that voters who did not come in under the "grandfather clause" had to submit, not to a *bona fide* educational test, but to the test of satisfying the registrars by giving a "reasonable explanation" of any clause of the Federal or State Constitution which the registrars might select.

Even the victims of customs-house methods must be impressed with the fine Roman spirit of it all. Mr. Loeb and the Treasury officials are determined to prove that, whatever may be said of American indifference towards law and law enforcement, here is one government department that lets neither public resentment, nor personal protest, nor decency, nor common sense abate one jot or tittle from the prescriptions of the law. Art dealers are now being forced to pay duty on paintings over twenty years old, contrary to the new tariff schedules, because they cannot, in all cases, comply with the provisions that call for a statement of the year and month in which the work of art was produced. Did Sir Joshua Reynolds put the finishing touches to a particular Duchess late in March, 1764, or early in April? Did Franz Hals begin work on a $50,000 Burgomaster's Wife on a Monday or a Thursday? As for that lovely bit of late Mycenean sculpture, kindly specify whether it was begun and completed within thirty days, or, if the lunar month prevailed then, within twenty-eight days. And so art dealers pay under protest and wait for some one in Washington to wake up before they get their money back.

While we have heard little of late of Mr. Edison's concrete houses for workingmen, to be made by the wholesale, the last issue of the *Survey* contains an interesting account of the $1,200 concrete house designed by Mr. Milton D. Morrill, a young Washington architect, a model of which was exhibited in the International Tuberculosis Congress of 1908. It can be made not only a house beautiful, but a house of amazing simplicity of operation. Insurance will not be necessary, for window and door frames are to be cast in steel, and walls will be of smooth concrete to be tinted or papered, while the flooring will be of concrete or of a composite terracotta. The furnace is not to go in the cellar, but is to be in the kitchen. A combination furnace and range, it will, by an ingenious device, burn up all garbage. The icebox will be built into the wall, with openings out-of-doors as well as in. The coal is to be stored on the roof, if you please, to which it is to be readily hoisted by a chain block. The two tons stored will slip down to the range automatically, as needed. In place of a piazza, the flat roof is to be converted into a solarium, or playground, and by the use of awnings is to be made a sleeping place, if desired. The walls are to be hollow, allowing a free passage of air, on the principle of the vacuum in the thermos bottle. But housekeepers will be particularly interested in this statement:

> All corners are rounded to give no harbor to dirt, and all fixtures are bracketed from the wall, so that sweeping consists merely in removing the furniture, attaching the hose and flushing ceiling, walls, and floor of each room.

If this alone does not sell the houses, we should like to know what will. The only detail lacking is the size of the $1,200 house and the number of rooms. In the picture in the *Survey*, the building appears to rival the Vanderbilt mansions in grandeur.

When we consider that Hudson did not discover New York Bay, but that Verrazzano did; when we consider that Fulton did not invent the steamboat, but that Fitch did; when we consider that Bell did not invent the telephone, that Morse did not invent the telegraph, that Gutenberg did not invent the printing-press, that Morton did not discover anæsthesia, that Darwin did not discover evolution, that Shakespeare did not write "Hamlet," that Homer did not write the Iliad, that Galileo did not say "And still it moves," that Wellington did not say "Up guards and at them," that Washington did not win the battles of the Revolution, that Robespierre did not create the Reign of Terror, that Nero was not a monster, that Cleopatra was not beautiful—when we reflect that history is emblazoned with the titles of usurpers and that true merit lies unchronicled in the grave, let us address a word or two of apology to that much-berated enemy of the truth, the newspaper. If history, with a thousand years' leisure at her disposal, cannot find out just who set up a new throne or pulled down an old one, let us forgive the reporter if he misspells the Christian name of the prominent citizen who was thrown from his automobile at 2:30 A. M.

The importance of the latest Shakespearean controversy is somewhat mitigated by the reflection that whether Dr. Wallace turns out to be right or the older view regarding the site of the Globe Theatre prevails, the tablet commemorative of Shakespeare's genius will, in either case, be erected in a brewery. The interests of truth may

suffer some temporary damage in the quarrel, but the shade of Falstaff will remain content. Ultimately, we take it, expert scholarship will come to an agreement, but meanwhile it is a bit saddening to find expert scholarship the prey of very much the same prejudices that influence Mr. Jones, Mr. Schmidt, and Mr. Riley when they debate the discovery of the North Pole. If so many Shakespearean students, so many noble lords, and so many honest London citizens were not committed by the memorial tablet to one side of the street as the location of the Globe Theatre, would there have been such a vehement repudiation of Professor Wallace's argument for the other side of the street? We are very much afraid that the authority of vested interests holds in the domain of star-eyed science as it does in the law of property. Human nature rules here and there.

Of the many topics commented on by Mr. Howells when interviewed on his return to this country, there is but one upon which he uses strong language. The burning questions of socialism, taxation, woman suffrage, on which the veteran writer is known to have pretty definite views, are discussed with the philosophic serenity of a looker-on in Vienna; but when he comes to tell of the effort now being made in London to carry on a tipless hotel he warms up decidedly. "If that can be done," he says, "it will abolish the whole cursed thing, because the other hotels will not be able to stand out against a no-tip opposition." The nuisance of the tip system is becoming greater in our large cities than anywhere else in the world, and Mr. Howells will have put thousands of his countrymen on the lookout for the emergence of the brave pioneer who will establish a tipless restaurant or hotel. There is only one way to abolish tips, and that is to act on Horace Greeley's maxim as to resumption of specie payments. The way to abolish tips is to abolish them, and it can be done only by the proprietor making a rule against tips, the violation of which means the peremptory discharge of the receiver. Every traveller in Italy has an object-lesson in the possibilities of such action when he sees, in that classic land of begging and tipping, the complete absence of the system at the centres of art or archæological interest in charge of the government. The peace of mind secured by this elimination doubles the pleasure of the visit.

The Liberal press in England protests against the assumption that the King's mediatory attempts will lead to a compromise on the Budget between the Commons and the upper house. Winston Churchill has reaffirmed the Government's intention to do or die. Royal intervention is resented in some quarters as an additional handicap imposed on the Cabinet. Is it not enough that the Liberal party must contend against a permanent majority in the House of Lords? Must its popular majority submit to pressure by the throne as well as by hereditary privilege? That would indeed make the execution of any Liberal programme impossible. But it is exceedingly doubtful if the King has tried to bring about a settlement by advising the Liberal ministers to moderate their demands. What the King could more usefully do is to counsel the Unionist leaders to yield to the Liberal demands. The aristocratic upper house is naturally the more susceptible to royal suggestion. Its members are more dependent than the Commons on the King's good-will in the sphere of social relationship. Many a peer who otherwise would readily obey Lord Lansdowne's order to vote down the financial bill, might hesitate if the act involved not only antagonizing the Commons, but making one's self *persona non grata* at court. Edward VII's aversion to a row of any kind is notorious.

It has remained for a German, and a German prince at that, to discover the true and underlying—and, by the same token, the irremovable—cause of English enmity to Germany. Apprehensions connected with the increase of German naval power are but a superficial element in the case, and jealousy of Germany's commercial expansion lies but a little deeper. It is Fürst Lichnowsky who lays this bare, in an article in the *Deutsche Revue*. It will be impossible to get rid of the German peril in England because British statesmen need it for the purpose of maintaining the higher qualities of the nation, threatened with progressive decadence "such as is represented by Oscar Wilde or Bernard Shaw." When the English statesman sees the decline of the ancient virtues and the old-time energies of his countrymen, the thought must inevitably come to him of making use of the Germans on the one hand as an example and on the other as a terrible peril. Since nothing is so well established as the fact that British statesmanship is always based upon profound abstract considerations, it is a wonder that this explanation of existing conditions has not been brought out before. Incidentally, the prince remarks that nothing has so wholesome an influence upon men as fear, a fact sufficiently proved by the effectiveness of the fear of hell; and since there are no signs of a revival of the good old-fashioned idea of hell, it is as plain as the multiplication table that British statesmen will feel bound for an indefinite period to make use of Germany as the only available substitute.

For a people of thrifty habits and much practical wisdom, the Chinese of late years have grown very fond of cutting off their noses to spite their faces. The commercial boycott, first used against us about five years ago, seems to have caught the Celestial fancy. The boycott is now agitated against Japanese goods in retaliation for Japan's aggressive policy in Manchuria. A little while ago, the Chinese of the southern provinces were boycotting British merchants because of a quarrel over court jurisdiction. Before that, the Chinese of the south were boycotting Japan in connection with the celebrated incident of the ship Tatsu Maru and smuggled arms. It is well if a nation recognizes her deficiencies—as the Chinese recognize their military impotence—and fights with the weapons it can best employ. But the weapon too often used will obviously lose its edge. Like the general strike in Russia a few years ago, the boycott from formidable becomes ridiculous. There is ground, besides, for suspecting the good faith of the Shanghai merchant who is in favor of bringing trade to a standstill every six months. While his simpler competitor believes and obeys, our shrewd boycotter undersells him on the quiet. That happened during the anti-American boycott, when wily Chinese traders laid in new stocks at reduced prices. In the end the Chinese consumer pays high, by formal indemnity and increased prices, for this form of pacific resistance.

PRESIDENT LOWELL'S INAUGURAL.

With earnestness and enthusiasm the new president of Harvard devoted himself in his inaugural to some of the pressing problems before him. Reconstruction of the American college is, as he pointed out, urgent everywhere. To the problem as a whole, every institution contributes when it takes its own forward steps. Hence, waiving general discussion, he went straight to the root of some of the evils with which he must himself grapple in Cambridge. It is to be noted, too, that he spoke as president of Harvard College, deferring for the present his views of the problems of the University. This in itself is significant. Mr. Eliot's chief interest was the University, so much so that the College, rightly or wrongly, has deemed itself neglected, and must therefore now feel that it is once more coming into its own.

For it is the question of the undergraduate that rests most heavily on Mr. Lowell's mind. He made it clear that he is not one of those who could look contentedly at the crushing of the college between the upper and the nether millstones of the professional and the secondary schools. Far from being willing to abandon the American college, Mr. Lowell holds that it is capable of even greater service to the country than heretofore. Taking Harvard as it exists, he expresses well the feeling of thousands of recent graduates that the lack of the old solidarity, when classes numbered fifty or sixty, is deplorable; that the elective system needs recasting, or that the undergraduate's studies should be better directed and controlled; and that the student's attention should be centred more on his studies and less on other interests. Mr. Lowell's willingness to admit that there is anything wrong with the elective system is in itself a break with previous tradition and policy, but a break for which he can find ample justification. Let him turn, for instance, to the just-published report of the class of 1894, now fifteen years out of college. The doubts expressed by a majority of its members as to the value of unlimited election of studies, as seen in retrospect, are highly significant. But what shall be substituted? So far as Mr. Lowell went in his inaugural address, he holds that the wise policy for undergraduates would be that "of devoting a considerable portion of their time to some one subject, and taking, in addition, a number of general courses in wholly unrelated fields." In other words, he desires an education which shall make a man a fair master of a specialty with enough training in other studies not only to give him a ground-work of culture, but to render him "capable of turning his mind effectively to direct preparation for his life-work, whatever the profession or occupation he may select."

To aid in producing men who know a little of everything and something well, Mr. Lowell proposes, as he has heretofore indicated, a series of honor examinations which shall stimulate to higher scholarship. These will doubtless be patterned after the Oxford examinations in literature, mathematics, and science. Something is certainly needed to make undergraduates respect achievements in scholarship as they do those of the athletic field. But the proposed honors can hardly be effective unless there comes into undergraduate life a wholly different attitude toward college work. Such a change may well be forwarded by the new scheme of freshman residence suggested by Mr. Lowell, giving a closer affiliation of students with the younger instructors, and that general inspiration to intellectual attainment which comes from contact with older and well-charged minds. Too often, heretofore, a man has spent four years at Harvard, and left without the memory of a single friendship with a teacher, with no spark of enthusiasm from the mind of one aflame with the desire for knowledge and truth. But we would not seem to under-value the proposed honor courses of study. The only real objection to them is that they will place a heavier burden on the overworked professor, even now often curtailed of strength and time for productive work, to such a degree that, as Mr. Lowell said, "America has not yet contributed her share to scholarly creation."

So far as the social life of the student is concerned, while Mr. Lowell might well have laid greater emphasis on the evil of athletics, his stand in regard to the democratization of the college must appeal to everybody. Harvard suffers but little more than other colleges from the false standards that mark social life in our rich communities. Every college, in its endeavor to place men on a common footing, has an increasingly hard fight against such foolish parents as that insurance company official who did not know what his son's allowance was because his secretary sent the boy whatever he wanted. Mr. Lowell's plan for housing the freshmen in separate quadrangles, we have already discussed, to approve. It means a long step forward, not so much in what it may actually accomplish, as in the abandonment of the impotent *laissez faire* policy of the past, in the face of new and luxurious dormitories, built by private capital, and utterly out of place in a society of scholars. Present conditions breed not merely the waste of scholastic opportunity which Mr. Lowell laments, but that class feeling, based on material possessions, against which every democracy must fight as for its life, and which is nowhere so incongruous as in the republic of science and letters.

About these and still other questions there will be much more to say as time passes. The essential point for thanksgiving to-day is that Charles William Eliot, the greatest pathfinder in our collegiate history, is followed by one who adds to noteworthy scholarship and equal idealism an insight into the weaknesses that have grown with our educational strength. It might easily have been Harvard's fate to have fallen into the hands of a business man, pure and simple, or into those of one absorbed in scholastic matters, without thought of the human problems involved. Her good fortune attends her in that the direction of her affairs has gone to one who sees clearly the needs of the hour, and is ready to grapple with them in a spirit of self-devotion, which, in itself, augurs success.

THE MORSE SENTENCE UPHELD.

The decision rendered Monday by the United States Circuit Court of Appeals, upholding the sentence in the case of Morse, the bank wrecker, is an event of the first importance. One aspect of the decision peculiarly interesting at this time is the way in which it strengthens the wholesome tendency, at last manifest in our courts of appeal, to ignore trivial objections. What the court says on this head is plain common sense, and it expresses what must become the standard attitude of our higher courts if justice is to be placed on a sound footing

in these days of enormous legal and business complexity. "In an unusually protracted trial," says the decision, "depending upon a wilderness of figures and during which a vast number of complicated transactions were investigated, it is not unnatural that mistakes should have been made. Neither is it surprising that judges removed from the excitement of the forum, who have time to examine the events of the trial as they appear when portrayed in cold type, should have discovered some rulings which may be open to criticism. But we are convinced that no prejudicial error was committed." Only by taking this stand can the administration of criminal justice, when applied to men of wealth or resources, be made a substantial reality, instead of a game of combined skill and chance, with the odds all in favor of the man who is fighting the law.

So far as public opinion is concerned, that appeal to the easy-going sympathy of the American people which is always made in conspicuous cases has here taken rather a curious shape. The very magnitude of the disaster caused, or at least precipitated, by Morse's dishonest operations has been made the basis of the most prominent and probably the most effective pleas in his behalf. Had it not been for the panic, we have been told again and again, Morse would never have been prosecuted so vigorously; he has been made a scapegoat, and it isn't fair to do to him what would not have been done under ordinary circumstances. Such a view of the matter may be creditable to the good-nature of our people, but it is anything but creditable to their sense of justice or of expediency. If it be true that the administration of justice in our country is so defective that a man may systematically violate the laws, endanger the safety of millions of money entrusted to his care under solemn obligations of fidelity, make false entries in his books to cover up his illegal transactions, and yet count upon immunity unless his crimes happen to result in a national calamity—if all this be so, is it rational to conclude that we ought to let the culprit off even in the one case in which we can lay hands upon him? Rather, is it not sounder doctrine and truer consistency to brace up the processes of justice in the ninety-and-nine cases where it fails, and not to nullify them in the one case where it succeeds?

However, it is only necessary to read the Court's decision in order to see that the conviction of Morse was not the result of undue severity, occasioned by the distress of the panic. The acts charged against him were of a definite and specific character. As a matter of course, those upon which the jury actually passed must have been, in the nature of things, only a little specimen of a multitude of similar transactions; but, at least, the illegal use of the bank's funds and fraudulent entries to conceal such use were fully established. Thus the higher court finds neither any substantial error in the conduct of the case by the court below, nor any reason for upsetting the jury's conclusions as to the facts. Such being the case, nothing remained to consider but the severity of the sentence, and on that head the Circuit Court of Appeals likewise found no just ground of complaint. Nor should the public. If fifteen years' imprisonment is too heavy a penalty for gross and continuous misuse of bank funds for the purpose of deliberately carrying on vast schemes of reckless speculation, then we had better make a radical revolution in our whole scale of punishments. Custom has hardened us to the spectacle of big criminals like Morse getting off with light punishment or none; now let those who are such sticklers for consistency demand that the little criminals—the people who commit petit larceny or pass counterfeit coins, or swindle people in a common confidence game—receive sentences of a few days in jail. The truth is that the glamour of wealth and success blinds us to the true nature of rascalities committed in the high fields of finance; and we have substituted for the benefit of clergy that prevailed in the days when a "clerk" was admired and feared of the people, an unwritten law of benefit of prosperity. Now, however, the signs point to a gradual but ultimately thorough emancipation from its dominion.

MANŒUVRES AND THE MILITIA.

The reported decision of the War Department against further army and militia manœuvres comes as a surprise—even to army officers, as Gen. Wood's interview of Friday morning attests. It was not understood that the hardships of the troops taking part in August were extreme—certainly they were not so severe as those experienced a year before in the camp at Pine Plains in this State. Lack of food at times there indubitably was. Some men went nearly twenty-four hours without a real meal, and fodder for horses was frequently lacking. This was due to the inexperience of the militia commissaries and quartermasters and to the reliance upon improvised transportation. Instead of taking regular army trains, reliance was placed on the wagons of farmers and on coal trucks secured in New Bedford, with the double purpose of placating the farmers and of teaching the troops what to do when turned adrift in a strange country. This was carrying realism too far, particularly as there were few farmers' carts available for the invading army. Many of these broke down, and frequently soldiers who had "fought" and marched all day, had, on bivouacking, to go to the assistance of disabled wagons and haul them into camp.

So far as the published official reports go, the actual disabilities appear to have been fewer this year than last. But that there were any serious complaints is a reason for taking up anew the whole question of the relationship of militia and regulars in this matter of joint manœuvres. The truth is that, since the war with Spain, the status of the National Guard has undergone a change. It is no longer merely a State body, as originally organized, drilled and trained for emergency duty, but is developing as a reserve to the army. At the present time, however, the militia is neither quite one thing nor the other. The old status and ideals have been abandoned, but the actual position as a reserve to the regular army has not been attained. Nor, in our judgment, can it be attained. If we must have such a reserve, it would be better to create one, according to the plan proposed in Secretary Root's time, when there was suggested a reserve of 100,000 men, honorably discharged from the regulars and paid a small sum to go into camp once every year for several weeks.

This is the European plan, and such reserves might be either in separate organizations or utilized as additional battalions of existing regiments. At present, we ask the physically impossible. Our militiamen are intelligent and thinking bayonets, of better physique and better officered than ever before. But in

New York, at least, they are required to drill only once a week for twenty-four weeks and to go into camp only every other year. The great bulk of them lead sedentary lives; many of them do not walk two miles a day. Yet at these long intervals they are thrown into camp with regulars, generally in the hottest period of the summer, and are driven to exercises that tax the endurance of men trained to service. Since the manœuvre period lasts for only eight days, it is packed with problems and drills. No opportunity is given to the militia to break themselves in gradually, and the only wonder is that a great deal more physical injury is not inflicted than is actually the case. Obviously, if these manœuvres are really to be of value, some way must be found to lighten the burdens, to extend the drill period, and to work the militia up to them so that they may meet the tests in an approximately adequate physical condition.

So far as the militiaman of the ranks is concerned, we have no hesitation in affirming that he will learn more if the joint manœuvres are abandoned and he is put into brigade camps, together with a regiment or battalion of regulars as an example to pattern after. A week's leisurely marching and camping in a pleasant country, with moderate battle exercises toward the end of the period, would send the men home better trained, happier, and in an improved instead of an exhausted physical condition. The main object in the training of the private soldier is that he shall learn to camp, to take care of himself in the open, to protect his bivouac, and march, and also that he shall acquire some knowledge of extended-order drill.

The real *raison d'être* of manœuvres on a large scale is not, of course, the training of the private soldier, but of the higher officers—the generals, and the staff officers who must feed and supply the troops. Militia quartermasters ought surely to be drilled in provisioning brigades before they tackle divisions or armies; and if still larger forces are needed for the sake of experience, it is a question whether the regular army is not a great deal better fitted to experiment on than thousands of callow youths, large numbers of whom break down—as they did in Massachusetts in August—because they have not been supplied with the right kind of footwear. Much is heard, nowadays, about the usefulness of militia as coast artillery reserves. This is ridiculous. Highly trained, technical troops are not made by one drill a week for six or seven months and by going to camp every other year. If militia are to be used as infantry guards to coast artillery forts, then, again, they can learn everything needful in brigade camps such as we have suggested. But they cannot be both fish and fowl. A militia and a reserve to a regular army on European lines are two wholly distinct things. Only the marine, who is a professional warrior, can be both soldier and sailor too. The National Guardsman cannot be a breadwinner 358 days in the year, and on a par with regulars, for manœuvre purposes, on the other seven.

HOW FAR WE ARE GERMAN.

The writer in the Berlin *Tägliche Rundschau* who has just transferred these United States from the Anglo-Saxon to the Teutonic firmament yields to a common disease among German students of things American. Pretty nearly every traveller from the Fatherland is under the duty of pointing out that we are not as English as we appear. The rest content themselves with pointing out that we are not as German as we ought to be. Professor Lamprecht was neither the first nor the last visitor from east of the Rhine to deplore the failure of the German element among us to impress themselves duly upon our civilization and our institutions. It is an old complaint that the Kaiser's subjects, under new skies, abandon too readily the ancestral language and culture. Excellent raw material for nation-building, they seem content to play the part of brick and mortar without attempting to shape the builder's designs or the architect's scheme of ornamentation. Thus runs the usual complaint. It makes way now and then for the more complacent "Well, bricks and mortar constitute a mighty useful part in building operations, and, anyhow, see what might have happened if things had fallen thus and so." Such a critic is the *Rundschau* writer when he asserts (1) that we are really a Germanic nation embracing 30,000,000 souls of Teuton descent, and (2) that if Muhlenberg of Pennsylvania, Speaker of the first House of Representatives, had not been recreant to his fathers' language, Mr. Taft and Mr. Bryan would now be speaking in German periods.

Why should Muhlenberg have insisted on conducting the debates of the first Congress in German? There is no reason why. A volume fresh from the Census Bureau, "A Century of Population Growth, 1790-1900," comes pat to the subject. The first Census did not concern itself with registering the place of birth or the place of parents' birth. But taking the names of the heads of families as a basis for determining nationality, the experts at Washington distribute the white population in 1790 into English, 83.5 per cent.; Scotch, 6.7 per cent.; Irish, 1.6 per cent.; Dutch, 2 per cent., and Germans, 5.6 per cent. North of New Jersey, the German element was almost non-existent. It was one-half of 1 per cent. in Maine, less than one-tenth of 1 per cent. in the rest of New England, and four-tenths of 1 per cent. in New York. With New Jersey's 9 per cent., we strike ore. In Pennsylvania, the Germans were 26 per cent. of the population, in Maryland 5.9 per cent., in Virginia 4.9 per cent., in South Carolina 1.7 per cent., in Georgia, Kentucky, and Tennessee, 2.8 per cent. Take the German population by itself, and no less than 70 per cent. was concentrated in Pennsylvania, while Virginia had 13 per cent., Maryland 8 per cent., and North Carolina 5 per cent. In only four States, therefore, did the German stock form more than one-twentieth of the population, and in only one, Pennsylvania, did it reach a point where it attained the least probability of influencing the language of the State as a whole.

As to the strength of German culture in 1790, the Census Bureau's volume supplies us with a single index. In that year the number of newspapers and periodicals published in the United States was 103. Of these there were six in the German language, corresponding almost exactly to the German ratio of population. All six were published in Pennsylvania, one at Germantown, *Die Germantauner Zeitung*, one at Lancaster, one at Reading, and three in Philadelphia, among the last, *Die Chestnuthiller Wochenschrift*. Pennsylvania's publications in all languages numbered 23, so that here, where the Germans were planted in solid bulk and where, if anywhere, they might exercise a cul-

tural influence disproportionate to their numbers, their newspapers run again exactly parallel with their population ratio. The one-fifth of the German population resident in the Southern States had not a single one among the twenty-four publications in that section. Evidently, we were not, in 1790, tottering on the brink of Teutonic culture and only saved from the plunge by Speaker Muhlenberg's treason to the language of Goethe.

The second point made by the *Rundschau* metaphysician, namely, that 30,000,000 Americans to-day are of German descent, is wrong, and badly wrong, but not so absurdly wrong as the enormous total would seem to imply at first sight. The problem is, of course, an extremely complicated one. It can be discussed only in a way apt to give great pain to the trained statistician. But on this point the Census Bureau itself indulges in a little pleasant speculation. In 1900 we had 35,000,000 of native stock, natives, that is, of native parentage. Allowing the German blood the same ratio it held in 1790, we get nearly 2,000,000 souls of that strain. In 1900 the population of foreign birth or foreign parentage numbered 29,000,000, and of these the Germans were between seven and eight millions. Add this to the old native stock and we have a total of 10,000,000. But allowance must also be made for the probably higher rate of fertility among the German population of old native stock. In any case, the remarkable change that has come over the face of the original thirteen States is illustrated in an analysis made in 1900 of the schedules for Hartford County, Conn., and Columbia County, N. Y., "which were regarded as typical urban and rural counties, respectively,' and which remained practically unchanged in boundary from 1790 to 1900. In 1790, Hartford County had no German residents; in 1900 they formed 12.2 per cent. of the population. In 1790, Columbia County's German population was four-tenths of one per cent.; in 1900 it was 17.2 per cent. A claim of fifteen million people of German descent in this country may not be excessive, and an error of fifteen millions is not very bad for a hot-blooded Pan-Germanist.

A HOLMES CELEBRATION.

The name of Oliver Wendell Holmes is associated so prominently with the delightful wit and wisdom of the Autocrat, and with his poetical works, that the celebration of his one hundredth birthday at a special meeting of the Medical Society of the County of New York must have been a surprise to many persons of the younger generation. Yet this remembrance of him by the medical profession is justified not only by the fact that he filled a professorship in the Harvard Medical School for five and thirty years, and had been a medical practitioner for twelve years before entering on the professorship, but by something much more significant. The same freshness of thought, the same combination of boldness and sanity, the same keenness of insight, that characterize the talk of the Autocrat and the Professor at the Breakfast Table, distinguished him both as a teacher and as a writer on medical subjects; and he made more than one valuable special contribution to medical knowledge. When the medical men claim him as their own, they do no more than justice to his work in the field of medicine and to the influence of his medical studies upon his literary achievement. It is safe to say that in the combination of qualities which gives to the writings of the Autocrat their distinctive attraction, the training and experience of the physician were an essential element.

In this year of notable centenaries there have been commemorations of more illustrious men than Dr. Holmes, but there has perhaps been none that recalled a figure more interesting or more refreshing. The mere dates of his life are pleasantly suggestive. It was not until his forty-eighth year that he devoted anything more than a fugitive attention to literary production; and then his entrance upon the work that has made his name a household word was due to the happy accident that the projectors of a new magazine asked James Russell Lowell to be its editor, and that Lowell made his acceptance conditional on the coöperation of Holmes. We confess to a feeling of envy for the people of that older time when we think of the beginnings of the *Atlantic Monthly*, and hear that it was only saved from an early death in the panic of 1857 by the fascination of the Autocrat papers. That is not the sort of thing we are now in the habit of looking for as an explanation of the prosperity of a magazine.

But not only did this astonishing medical professor start in at the age of nearly fifty to captivate his countrymen by a series of witty and original *causeries* on every subject under the sun, but he maintained the same freshness of spirit and the same vivacity of expression almost to the close of his fourscore and five years. In "Over the Teacups" we do, indeed, find a falling off from the first sprightly runnings of the Autocrat, though the same genial quality shines through here and there; but this is to be ascribed to the difficulty of keeping up indefinitely one particular *genre* rather than to any real decline of vigor. That his hand had not lost its cunning is witnessed by the preface to the new edition of his Medical Essays, written in 1891, at the age of eighty-two. Speaking of the history of homœopathy since the days when he had written about it half a century before, he refers to the doctrines of the "mind cure" and the "faith cure" as encroaching on the homœopathist's territory. "It would not be surprising," he says, "if the whole ground should be taken possession of by those new claimants, with their flattering appeals to the imaginative class of persons open to such attacks. *Similia similibus* may prove fatally true for once, if homœopathy is killed out by its newborn rivals." No sign here of any intellectual decay.

To the making of Dr. Holmes's wit went many qualities, and qualities of an elusive character. The man who wrote both "The Last Leaf" and "The Chambered Nautilus," both "The One-Hoss Shay" and "Old Ironsides"; who was recognized as the most delightful talker in a group of friends that included Longfellow, Lowell, Agassiz, and Motley, but whose love of humor did not prevent him from waging a life-long warfare against dogmatic narrowness, whether in theology or in medicine—such a man had evidently too wide a range of gifts to be caught himself in a formula. But if there is one quality more than another that can be pointed out as distinctive, it is the combination of boldness and wit with sanity and open-mindedness. An unblushing dispenser of half-truths, he knew how to put them so that, while losing none of

their point, they were not to be mistaken for whole truths; using epigram and paradox with a fertility seldom surpassed, he yet never got out of sight of solid common sense. In these days of Christian Science, psycho-therapy, and ghost-craft, nothing would be more amusing and few things would be more wholesome than the steady play of a wit like that of Oliver Wendell Holmes. What is good or true in any of them, he would have frankly recognized; at what is preposterous or pretentious, he would have thrown the shafts of his satire and his logic; and through it all we should have enjoyed the dexterity and fertility of his fancy. In celebrating his anniversary, the New York Medical Society recalls a memory which it is always a pleasure to revive.

LAURENCE STERNE.

I.

To Walter Bagehot, reviewing the first edition of Percy Fitzgerald's "Life of Sterne," it was matter for surprise not that Sterne's life had not been written in detail until 1864, but that it ever was written in detail at all. It was, he opined, a simple life, and one that offered small material for the biographer. H. D. Traill, who based his short Life of Sterne upon Mr. Fitzgerald's, wrote of the latter after eighteen years: "It is hardly too much to say that it contains . . . nearly all the information as to the facts of Sterne's life that is now ever likely to be recovered." Bagehot's opinion and Traill's prediction have been falsified by the facts. Looking both backward and forward from 1864, we find not only ample biographical materials, old and new, but also numerous essays toward a biography of Sterne, testifying to a lively interest, rather controversial at times, in a personality and writings which are far from simple, and which still leave room for much honest difference of opinion. A brief account of these biographical essays will help to fix the value of the latest and best of them—that by Professor Cross;* which in turn affords opportunity for a re-appraisal of Sterne's problematic character and works.

Numerous fanciful articles in the newspapers exploited Sterne during his lifetime; and his friend, Hall-Stevenson, exploited him after his death, in an inaccurate biographical notice prefixed to a spurious continuation of the "Sentimental Journey" (1769). Sterne's own "Memoir," published in 1775 by his daughter Lydia, for whom he wrote it, is a prime source of information about his ancestry, and his life before 1762. John Macdonald, once footman to a friend of Sterne's, and "La Fleur," once valet to Sterne himself, both contributed to Sterneana in 1790—the one a striking and probably true account of Sterne's death, the other much apocryphal matter about his travels in France. Some of this, reprinted in 1814, was used again in 1823, together with Sterne's "Memoir," by Sir Walter Scott, for one of his "Notices of Eminent Novelists." In 1851, Thackeray, himself sealed of the tribe of Sterne, attacked him with the bitterness of family dislike, in the last lecture on "The English Humorists." To this attack I shall return later; at present it is enough to say that Thackeray's unfavorable opinion of Sterne rested largely upon a mistake of fact, a mistake which remained uncorrected for many years because it arose from Thackeray's private inspection of a document unknown to the public until 1878, and not published until 1904—Sterne's famous "Journal to Eliza" (Mrs. Draper). Meanwhile, in ignorance of the "Journal," Whitwell Elwin published his *Quarterly* article in 1854 (reprinted with additions, 1902)—the first serious endeavor to form an estimate of Sterne by induction from all his works, from his letters as they were then arranged, from the opinions of his contemporaries, and from his life as far as it was then known. To Mr. Fitzgerald, however, belongs the credit of having written the basic biography of Sterne. And yet his "Life" (1864), though it more than satisfied Bagehot, and served as a foundation for Traill's volume in the series of English Men of Letters, was to be wholly superseded by a revised edition in 1896, based upon fresh materials and almost entirely rewritten. The biographer availed himself of the "Journal to Eliza," then still unpublished, but in the British Museum since 1894, and of much else that had turned up in the interval since 1864—Sterne's school copybooks, for instance, his important letter to his uncle, and several other letters—material some of which profoundly modified the basis for an opinion about Sterne. In fact, Mr Fitzgerald's estimate was largely the outcome of a reaction against his own earlier opposition to Thackeray's view: he was led around to the severe opinion he had opposed before. The result is a certain uncharitableness and controversiality of tone. Despite this, however, and despite some incoherence and much inaccuracy, Mr. Fitzgerald's "Life" is most readable; indeed, in its reminiscences of travel on Sterne's track in France, is quite delightful. The article by Mr. Sidney Lee, in the "Dictionary of National Biography" (1898), correct in the main, repeated some traditional errors, but offered a valuable bibliography and interesting remarks upon Sterne's literary influence. In 1904 Professor Cross edited the Works of Sterne, reprinting with them Mr. Fitzgerald's Life, which he corrected in an introduction and footnotes. For this edition, too, he wrote other valuable introductions, involving thorough study of Sterne's literary and personal character, and place in literature. He rearranged Sterne's correspondence in chronological order, making of it thus almost a new biographical document. He printed numerous unpublished letters, though he omitted as spurious some published letters which his later investigations have proved to be genuine. He published for the first time the "Journal to Eliza." He reprinted, together with other miscellanies by and about Sterne, the important "Yorkshire Anecdotes" sent by John Croft to Caleb Whitefoord in 1795 and 1796, but not published till 1898. Thus qualified for the task of biographer and critic, and further qualified for that of critic by his studies in the evolution of the novel, Professor Cross came to the preparation of the present Life.

Here again he has employed material hitherto unused—not only his own Introductions to the Works of 1904, the Letters as there rearranged, and the miscellanies and anecdotes there published; but other letters besides, some of them still unpublished, in part from Sterne's letter-book, now in private hands, in part from the Parliamentary "Report on Manuscripts" (1903); as well as the first (and full) edition of Sterne's pamphlet, "A Good Warm Watch Coat" (1759, unknown till 1905); and numerous contemporary periodicals, letters, and memoirs, and records legal and ecclesiastical. Despite the warning example of Bagehot and of Traill, it certainly seems safe now to say that the harvest has been reaped, and that whatever, if anything, remains ungathered in this field must prove to be only gleanings.

II.

The present biography differs again from its predecessor in dealing more largely—as its title indicates—with Sterne's contemporaries and "environment." Sterne saw the best company; and his biographer exhibits him in association, personal or literary, friendly or hostile, with many distinguished persons of his time. The names of Garrick, Smollett, Johnson, Goldsmith, Gray and Hume, of Richardson and old Lord Bathurst, of Warburton, Wilkes and Horne Tooke, of Reynolds and Romney, Hogarth and Gainsborough, of Walpole, Lyttelton, Chesterfield and Pitt, illustrate these pages. Sterne visits France, is received by d'Holbach's circle, knows Diderot and d'Alembert, piques the curiosity of Choiseul, makes a bargain with the younger Crébillon, and a convert of Mme. de Vence. From Dr. Eustace of

*"The Life and Times of Laurence Sterne," by Wilbur L. Cross, Professor of English in the Sheffield Scientific School of Yale University. New York: The Macmillan Co. $2.50 net.

North Carolina he receives a cane; he meets Benjamin Franklin and books his subscription for a volume of Sermons; he is pleased to get an introduction to clever Miss Graeme of Philadelphia, and he corresponds with the young Virginian, Arthur Lee. There are pleasant particulars of travel: "Bring your silver coffee-pot," Sterne writes to his wife, "'twill serve both to give water, lemonade, and orjead—to say nothing of coffee and chocolate; . . . as also a strong bottle-skrew." The heroic physic of the time—with its bleeding and purging, its *bouillons à santé* made of boiled cocks and male crayfish, its Elixir of Bardana, Dr. James's Powder, and Van Swieten's Corrosive Mercury—enlivens the biography, though it helped to kill the man. So agreeable is Professor Cross's gossiping vein that one has scarcely the heart to remark how it leads him here and there into irrelevancy. This is the pardonable weakness of a writer who knows his subject in every detail. His wanderings are the more venial in that they are not mere speculations of his own: relevant or not, when he professes to be stating facts, it is facts that he states, and his assertions are conscientiously "documented." The reader, too, cannot but be grateful for a love of detail that has furnished so many interesting particulars, hitherto obscure, about Sterne's life before he acquired fame.

Especially diverting is the Trollopean chapter on the intrigues that were rife about York Cathedral Close concerning the Commissaryship of the Peculiar Court of Pickering and Pocklington—a name that is simply too good to be true. It was Sterne's satirical pamphlet entitled "A Good Warm Watch Coat" that dissolved in laughter the ire which had risen in the celestial minds of deans and chapters, archbishops and pluralists. This account is a distinct improvement upon Mr. Fitzgerald's comparatively meagre and incoherent version of the same events. Notable, too, as containing valuable matter mostly absent from Mr. Fitzgerald's Life, is the section on Sterne's reading (The Parson in his Library). Having given honor due, as of course, to Rabelais, Cervantes, and Burton, the greater among Sterne's literary ancestors, the chapter offers illuminating notes upon the lesser or more obscure. Here is Arbuthnot, with remarks on breeching and education; here is Bishop Hall, from whose sermons Sterne conveyed whole paragraphs. Here are D'Urfey, Dunton, and Flud, in whom he found blacked pages and blank pages, dashes and index-hands, misplaced chapters, antenatal chapters, and a preface in the middle of the book. Here are Bouchet and Béroalde de Verville, with other compilers of facetiæ and inventors of *galimatias;* Bruscambille, a gate to the vast literature Of Noses; and many another source of out-of-the-way lore on logic and cursing, law civil and law ecclesiastical, fortification, gunnery, obstetrics and theology—"the sisters three, and such odd branches of learning." It is well that information about the *provenance* of Sterne's works should form part of his biography, instead of being left for scholars to disinter from Dr. Ferriar's "Illustrations" or from special studies of Sterne's literary pedigree.

A slip and an omission have been observed here. All the references to Ozell's version of Rabelais (pp. 132, 236, 238, etc.) plainly imply that Ozell was the translator; whereas in fact he merely revised (1757) the standard translation by Urquhart and Motteux (1708), adding Le Duchat's notes from the Amsterdam edition (1711) of the original. Again, Croft added to his partial list of Sterne's favorite books the remark that "he was allso a great Admirer of the pathetick novell Le Doyen de Coleraine." Professor Cross omits this title from the list quoted from Croft (p. 131), nor does he mention it elsewhere. It is the Abbé Prévost's "Le Doyen de Killerine." The hint is one that a biographer might have done well to follow up; for the story—about a benevolent deformed unmarried brother who (*inter alia*) is exposed to the fascinations of a wily lady on a sofa—was probably not lost upon the creator of my Uncle Toby and the Widow Wadman.

It may be regretted, too, that the strict design to present a personal rather than a literary history of Sterne has excluded a chapter upon Sterne's literary progeny and collateral descendants—a chapter for which Professor Cross's previous studies, together with those of Messrs. Thayer, Baldwin, and Texte, furnish ample material. To trace Sterne into Mackenzie's "Man of Feeling," into Bulwer-Lytton, into the early work of Charles Reade, into Thackeray, who, despite his revolt, felt Sterne "along the blood," into Dickens, into George Eliot, into Diderot and Gautier and De Maistre, into Goethe and Lessing, even into Mr. Le Gallienne's posturing, Mr. George Moore's devotion to obstetrics, and his sentimentalizing about a consumptive waitress—this would surely have been a grateful task to Professor Cross, and must have issued in a chapter most welcome to the reader. Sterne's literary posterity, as well as his literary ancestry, should have a place in his Life.

When all deductions are made, this Life of Sterne, which is every way as readable as Mr. Fitzgerald's, decidedly improves upon the latter in fulness, accuracy, coherence, and impersonality. Its large inductive basis in fact, and, maybe, the perspective of time, have enabled Professor Cross to deal more charitably than his predecessor with Sterne and with Eliza, and to avoid Mr. Fitzgerald's controversial tone. Certainly, in all matters of fact Professor Cross's Life quietly takes the lead. Together with Sterne's writings, of course, it constitutes definitely, one must think, the basis upon which its readers may be justified in forming each his own temperamental opinion about Sterne. It instructs us; it makes each of us an expert and a judge.

III.

The indictment against Sterne has many counts. Walpole gave currency to the epigrammatic charge, whose point Byron sharpened, that Sterne neglected his mother. Thackeray must have had an inkling of its untruth, for he did not repeat it. He did fall foul of Sterne, though, for making love to Lady Percy while making love to Eliza ("English Humorists"). These two charges are groundless. The first of them is disposed of by Sterne's manly letter to his uncle (April 5, 1750), which remains uncontradicted, and which in itself bears the stamp of truth. The elder Mrs. Sterne regarded Laurence's marriage to an heiress as a gold mine for herself. Not content to remain in Ireland, where she had been living upon her pension and "by the help of an Embroidery school that she kept," she must come to England and besiege her son there. Her daughter, who lived with her, stupidly and snobbishly refused lucrative employment. The son contributed generously, and at a very real sacrifice, to his mother's support at Chester, but he was not prosperous till after her death: and she could not reasonably complain if he did not settle upon her a part of his wife's income. At length, upon one of her predatory visits, Dr. Jaques Sterne, who had quarrelled with his nephew Laurence and wished to embarrass him, "placed Mrs. Sterne and her daughter Catherine in some charitable institution at York, perhaps the workhouse or 'the common gaol,' and then spread the report that they were there by neglect of the Vicar of Sutton"—viz., Sterne; "a hard report which might do me (as a Clergyman) the most real disservice," Sterne justly complained. Such was the origin of the lie that Sterne was unfilial. It is time this lie were "nailed." As for Thackeray's charge, it is literally annihilated by the true chronology of Sterne's letters. The *billet-doux* to Lady Percy has been shown by Professor Cross (Life, p. 343n; and edition of Letters) to belong to April, 1765. Sterne did not meet Mrs. Draper until 1767.

The truth is, though, that Sterne, in some ways a good husband and in nearly every way a good father, was always having a love-affair with somebody not his wife. These amours, if not guilty in a conventional sense, were still both the effect and the cause of a most injurious relaxation of character into morbid and attenuated sentiment—into a general de-

billity, in fact, and deliquescence of the emotions. Sterne's low state of physical vitality, which in Professor Cross's view is a palliation, seems to me rather to take away the excuse that charity might have granted to a robust and overmastering passion.

The biographer is indulgent, too, to Sterne's duplicity. It does not look well that Yorick should traduce his Eliza; and we can only hope that Professor Cross is right in his supposition that "the disrespectful reference to Mrs. Draper" in one of Sterne's last letters was "edited in" by Lydia. But there is not even a supposition to palliate the sanctimonious hypocrisy of Sterne's letter to Warburton about Hall-Stevenson's "Odes," or his self-confessed lie to Eliza about those unnamed friends of hers whom he wished to discredit because they had interfered between her and himself. It were to be desired that Professor Cross had adverted to these actions, and that out of his broader knowledge of Sterne's life he had either offered some excuse for them or left them expressly without excuse. As he has said nothing about them, we have no choice but to condemn. Greater ingenuousness on the part of Sterne's biographer might here have done less disservice to Sterne's memory.

IV.

Fundamental, thus, to Sterne's books, as well as to his life and personal character, is a relaxation of mind which loses salutary distinctions—an irrational mental habit which so dissolves idea from idea that it can neither set up one thing clearly against another, nor combine two things into an inclusive one. This essential of his psychology is worth dwelling on.

Sterne told Suard that "the sacred informing principle of his soul" was one "which exalts and varies, in sudden and unexpected ways, all sensations." In the same conversation he went on to praise the philosophy of Locke, which commended itself to him especially because it "never attempts to explain the miracle of sensation; but reverently leaving that miracle in the hands of God, it unfolds all the secrets of the mind." The portion of Locke's philosophy thus emphasized, Sterne was indeed temperamentally predisposed to understand and to like; other portions were to him, I think, almost sealed. At best he could make but little of the philosophy of perception, of conception, of judgment, of reasoning, of "secondary ideas," of all subsumption of two or more concepts under a generalization, of all that elaborate mental superstructure which soon conceals the sensations upon which it rests. But Locke's doctrine that the mind at birth is *tabula rasa*, that it has no innate ideas, "Platonic" or other, that, in fact, such ideas have no real existence, inasmuch as there are no universals, and that the immediate and only source of knowledge is the impact of an outer world upon the mind—Locke's nominalism, dualism, and sensationalism in a word—Sterne's mind could readily grasp and Sterne's temperament would eagerly accept. For to Sterne likewise the generalized, the universal, does not exist; all that appeals to him is the separate object and moment of consciousness—the sensation with its attendant emotions. In him reaction is instinctive; it is an impulse: there are no "higher centres" or "inhibitive associates" to check it, no middle terms or broader concepts to spread it out thin. "Reason," he said, "is half of it sense." And prudence, caution, discretion, which the world calls virtues, he was ready to condemn as vices. They tend to smother impulse, to sicklY it o'er with the pale cast of thought, and make it lose the name of action. For others the sober second thought upon mortal considerations; for him the immediate reflex, the squeeze of the hand, the dropping tear.

If Sterne could have reasoned the matter out, he might have declared, like some philosophers of the present day, that reason falsifies life by taking the juice and raciness out of life. He much prefers that life shall be, for him, disparate, discrete, discontinuous; not unified, but pluralized; each moment held only so long as to enable him to degust it, and then left to its fate, untransformed, nay, untouched, by reason, or by memory, or by hope. In this way all moments and objects of sensation become of equal value; there is no bothersome ethical scale; all is coördinate; nothing is higher than anything else, or includes or subordinates anything else by way of genus or law. Theory, law, generalization, make their appearance in Sterne only to be laughed at: witness the Shandean hypotheses concerning noses, auxiliary verbs, and given names. That which, according to Huxley, constituted Herbert Spencer's concept of tragedy, bulks large in Sterne's concept of comedy: "A beautiful hypothesis killed by a cruel fact."

But Sterne could not have reasoned the matter out. It is not easy to reconcile Professor Cross's assertion (p. 515), "In the background of Sterne's character . . . lay, as Bagehot once pointed out, a calm pagan philosophy," with his other assertion (p. 519), that Sterne "gave way to the emotions of the moment, receiving no guidance from reason, for he had none." In fact, *pace* Professor Cross, what Bagehot said was not that Sterne possessed a calm pagan philosophy, or any philosophy at all, but that "Sterne was a pagan." There must have been at Alexandria—and for that matter at Athens, too—many pagans who were not philosophers. Sterne is of these. He does not love to be wise: on the contrary, he opposes with all his sensation-loving soul the translation of sensation into law, and of experience into wisdom. Philosophy in any proper sense he has none; he simply has high spirits.

Akin to the confusion of thought and of terms involved in attributing a philosophy to Sterne, is the confusion latent in Professor Cross's thesis (pp. 190, 445) that "Tristram Shandy" really does possess plan, and that there is method in Sterne's madness, inasmuch as he "playfully organized" his whims "on Locke's theory of associated ideas." Thus the begetting of Tristram suggests his birth; his birth, the midwife; the midwife, her being set up in trade by Yorick's wife; Yorick's wife, Yorick; and so on *in sæcula sæculorum*. Well so do Dame Quickly, and Juliet's Nurse, and Miss Bates, and many other delightful females, both in fiction and out, follow the lead of their associated ideas. The fact is that Sterne is, like them, the plaything of his mental associates. And why not? All states of consciousness being of equal value, why subsume two or more under one, or—giving one state undue attention and time—stay by it till it drops? Rather hurry on, with all possible diversity, digression, and divagation, with swift transition, with alarums and excursions, to the sensuous and emotional content of a new moment suggested by the old.

V.

No final judgment upon Sterne can ever, I think, be passed. He will be more or less acceptable to different times, to different peoples, to different men, and, notably, to different moods in the same man. Judgment upon him is, more than in most cases, a matter of temperament. But what makes the question worth discussing at all is that Sterne will, to different times and peoples and men and moods, be present to be judged. For, after all, despite his want of any rule of life, he does present a type of personal and literary character that is pretty complete and permanent. Much in the same way as my Uncle Toby gets himself made into a character with a minimum of planning on Sterne's part, so does Sterne himself come after a while to stand for something definite, something in which we all share, something that is likely to last. He has even suffered over-development, he has suffered moral obliquity, like Machiavelli's prince, that he may realize a perfect type. He stands for all that poses, for all that feels without judging, for all that is double and inconsequential and incoherent, for all that is at loose ends, in each of us; for that "bit of chaos" that each of us carries about. It is by virtue of this that he makes his appeal. Just in so far as we long to have every sensation, every image, informed with an idea, he will repel us. Just in so far as we are in-

terested in the Many, not the One, he will attract us. Only in poetry, only in the prose of men greater than Sterne, do the form, the color and the sound, the fragrance and the magic of sensation body forth wisdom and the laws of life. There, but never in Sterne, do the Many become the One.

Certainly, both the "tender-minded" and the "tough-minded" will agree in rejecting some part of Sterne, for this is a matter more of the stomach than of the mind; but, in general, they will split upon him as upon all things else. Those who do not wish to "wallow in unbridled unity" will find in him a kindred soul; those who see in the choir of heaven and furniture of the earth a hierarchy and a symbol, those for whom "Alles Vergängliche ist nur ein Gleichniss," can never rest in him a longer time than the contrary mood takes to pass away. But if the transcendentalist is ever inclined to be too hard on Sterne, he will do well to remember his own contrary moods of illusion, to remember that he himself likewise bears about with him the human heritage of yet unconquered chaos, and to give ear to Sterne's own request: "As we jog on either laugh with me, or at me, or in short do anything—only keep your temper."

S. L. Wolff.

New York City.

FRENCH FICTION.

Paris, October 1.

In his new edition of "Le Roman en France pendant le XIXe siècle." (Plon), which was crowned by the French Academy, Eugène Gilbert gives a chapter on the French novel during these last ten years, and of this season's crop there are ten names which were known to fame before the century's turn. Of these, Marcel Prévost signalizes his election to the French Academy by the publication of "Pierre et Thérèse" (Lemerre), which had already received the consecration of the *Revue des Deux Mondes*. This writer, even when he portrays the subtle, subconscious motion of the worldly woman's soul, or of the young woman trembling on the world's edge, is full of ideas and much common sense. Thus has he so long retained his position as spiritual director of the modern female—*similia similibus*. There are two ideas, at least, in the present novel; and they are modern enough. Pierre, the husband, has made his fortune masterfully, barely avoiding the law of the land rather than watchful of honor and morality. Thérèse, the wife, is of a family where high moral sensitiveness is a matter of inherited nerves and heart; but the masterfulness of the *parvenu* holds in willing thrall the more refined soul, even when she discovers that business and morals have clashed dreadfully. Here the first idea is evidently that of Paul Bourget's "L'Étape"—no man can entirely skip natural stages in the social ascension: the conscience, such as it is, remains. The second idea is pure Marcel Prévost: ingrained feelings of honor will be cast to the winds before the casuistry of a wife's enforced love. Along the way, there are intense and tragic situations, which, like the ideas, do not enter into traditional English notions about French novels. Finally, without the name being mentioned, there is Nietzscheism in the book, as there is in the ambient air, even of our own business men.

A more notable woman's novel—by a woman—is "Le Droit à la force" (Plon) by Daniel Lesueur (Mme. Henry Lapauze). She had written more than thirty novels, all fairly successful, besides a few plays and a complete translation of Byron, before she leaped into the forefront of her sex's thought with "Nietzschéenne," which the present story follows. In peaceful country scenes, the worthy brother has to sacrifice honor and love to the unworthy, whose hands moreover are imbrued in blood, until more blood is shed on the principle "Every being has a right to force against cowardly and low malice." This unwritten law is supposed to be the mental property of American men, rather than the literary baggage of French women writers; but the underlying love story of an "ingenuous" soul makes the book womanly. The author has already had to protest with force against the use made of this novel by *The Indian Sociologist* to countenance the recent murder of an Englishman by a Hindu anarchist.

J. H. Rosny, the old signature of two brothers who are both of the Goncourt Academy, appears once more in "Nymphée" (Société Française d'Imprimerie), although it has been announced that each author will henceforth make himself known individually. Together, they have won a faithful public. The present book belongs to their prehistoric romances, where anthropological science is tempered by psychology of modern souls, and the wonted acrid style is softened by imaginations of primeval love and adventure. The prehistory is perhaps more real than in our English books; the story is startlingly different. For "Les Sept Femmes de la Barbe-bleue" (Calmann-Lévy), and other marvellous tales, Anatole France uses more than prehistoric fancy and more than modern cynicism, with graces of style in proportion and edification in inverse ratio. The first wife shows bears at a fair; the second is a drunkard; the third smells of onions; the fourth is too hospitable; the fifth, a fool; the sixth, a prude; the seventh kills Bluebeard, who, for his own part, has killed never a wife! In "Les Confidences d'une 'Biche'" (Lemerre) Abel Hermant continues his "memoirs (realized conceptions of his own) to serve for the history of Society." In this number the society about which confidences are made is that of the Second Empire, whose frivolity and light brilliance were conceived as orgies by those who were not of it. The Lady Ventmor who makes these confidences is now a blonde with another existence; she was brunette, and known as "La Solférino" forty years ago in the life she recounts lovingly with somewhat too high flavors from Abel Hermant for the diet of the young person. Evidently an author so completely the master of his thought and style could not bring all these dubious memories of the past to light without crude flashes on the present.

Paul Margueritte, who, with rare lapses, may be taken as a serious writer, publishes in the cheap, illustrated, popular series a new novel, "La Flamme" (Fayard). "La Coure à l'abîme" (Roger & Chernoviz), by Ernest Daudet, is a romance under the Terror. This writer, who is older than his more famous brother Alphonse, has been a prolific author of estimable books, historical in matter when not in form. The history is based on learning, conservative in trend, and the writing is both readable and amiable.

"Le Vent du boulet" (Monde Illustré), by Georges d'Esparbès, is a good, old-fashioned soldier's tale of Napoleon's war in Spain in 1808. This writer may be little known abroad, but he has had a solid popularity in France from his first book in 1893, always with trumpets and guns and laughter of camp-followers, and withal the virtues of soldiers whose business 'tis to die.

"Le Feu de joie" (Lemerre) must be nearly the eightieth novel of René Maizeroy, a baron and ex-officer descended from generals and marquises of the old régime, of which his books smack in their portrayal of very modern lives. "La Folle Passion" (Lemerre) is a new novel by Marie Anne de Bovet, who at one time at least was well known in both England and America and has remained a popular writer at home in France.

André Lichtenberger won his first and lasting success on the threshold of the twentieth century with his Petit Trott and sister, whom the French Academy crowned. No one expresses better or more kindly the not inarticulate soul of the French child of to-day. "La Petite" (Librairie des Annales) follows up the girl where she looks to the advancing shadow of young womanhood. The gown of Lilette is now "demi-long."

"L'Homme sans figure" (Pierre Lafitte), by Albert Boissière, is a feat of fantastic story-telling, like the other novels of this author. Without the slightest human sympathy for his faceless man, the reader is swept forward from one intensely strange and interest-

ing episode to another. "L'Aiguille creuse" (Pierre Lafitte), by Maurice Leblanc, continues the extraordinary adventures of Arsène Lupin, some of which have been translated for English readers. This new series, while still outdoing Sherlock Holmes, transports us into all sorts of picturesque survivals of romantic times more proper to the French genius.

Charles Pettit in his first book introduced us to China, which he knows so well, and to Chinese womanhood, which he probably has divined. It was delicate as porcelain, cruel as the tortures of a nerveless race, and amusingly unmoral. The lighter side comes out more uniformly in his new story of "Pétale de rose et quelques bonzes" (Calmann Lévy). Lucie Delarue-Mardrus, known as an ultra-modern poetess, and wife of the ultra-complete translator of the "Arabian Nights," publishes "Le Roman de six petites filles" (Fasquelle). The story is rather for the mothers—and elder brothers—than for the little girls themselves; and some of the incongruities are more than enormous. Frenchmen and women are said to be lacking in humor; but here is a Frenchwoman overburdened with it. Of course, there is much delicate writing in between.

"Le Médecin" (Fasquelle), by Charles Edmond Lévy, is from a new author, who begins well, if a little clumsily. He must himself be a doctor, to have studied so minutely the rôle of the physician in families and society; and an analysis of the kind is useful quite apart from literary pleasure. Louis Delzons, a Paris lawyer, now laudably writes under his own name, although his first notable court romance was signed Louis Estang. His present novel, "Les Mascran" (Calmann-Lévy), is the story of an old provincial family of notaries whose desire to "appear" in the world of which society papers talk leads them step by step from châteaux and officers' clubs and haunts of more newly rich, through love, covetousness politics, to the loss of honor, and even of its notion. This fate of a family rich and respected in its own world by inheritance, when transplanted into the struggle for society life, forms one of the strongest novels of late years. "Francine Davier" (Ollendorff), by Madame Pierre de Bouchaud (wife of the writer on Italian art and poetry), studies a *petite bourgeoise* who seemed condemned to gray days with old people in her lone village. The world of books is revealed to her, and when at last she comes to Paris, without ceasing to be of her little world, she soars high at the Sorbonne, and, later, off to Italy, so that when she has to come back to her village she bears a kingdom in her mind. Henry James treated tragically such a person; this story is happier, more helpful, and perhaps not less real.

S. D.

NEWS FOR BIBLIOPHILES.

The four auction houses all hold sales next week. Buyers are, for the most part back from their summer vacations, and from now on books of the better class will be frequently offered.

In four sessions, afternoons and evenings of October 19 and 20, the Anderson Auction Co. will sell Part I of the library of Collin Armstrong of Quaker Ridge (Scarsdale), N. Y. This library is mainly made up of modern books and of issues of the Bibliophile Society, Grolier Club, Doves Press, Essex House Press, and other private or limited series, including several autographed copies of William Loring Andrews's publications. Among the books illustrated by George and Robert Cruikshank are first editions of the "Life of Napoleon," by Dr. Syntax; "The English Spy," by C. M. Westmacott; "Scraps and Sketches," "Uncle Tom's Cabin," and others. Books illustrated by Kate Greenaway, Randolph Caldecott, and Walter Crane are also represented. Among sets there is a fine complete series, thirty-two volumes, of the original Townsend Cooper, every volume having the correct Townsend imprint; a large paper set of Chalmers's "British Essayists" (1866), and of the works of Aldrich, Hawthorne, Holmes, Emerson, J. M. Barrie, and others. The most notable first editions are those of Eugene Field, twenty-seven lots, and Lafcadio Hearn, nineteen lots; but first editions of other modern authors are represented.

On October 21 and 22, the same house will offer a collection, including a portion of the library of the late George D. Denniston of Pittsburgh. A set of the Halliwell-Phillipps Shakespeare, seventeen volumes, folio (1853-65), each volume enclosed in a levant morocco slip case; the Dictionary of National Biography, original issue in sixty-three volumes; subscription sets, some on Japan paper, of the works of Fielding, Dumas, Hugo, Dickens, Tolstoi, Stockton, and other writers; and illustrated books, specimen bindings, etc., are included.

On October 18, the Merwin-Clayton Sales Co. offers a collection, including a series of books on the American Indians, some first editions, and a small lot of book-plates.

On October 19, 20, and 21, they sell the first part of the important library of Charles M. Wallace of Richmond, Va. Hakluyt's "Voyages" (1589); Burk's "History of Virginia" (1804-16), with the rare fourth volume; Venegas's "Natural and Civil History of California" (1758); Carver's "Travels Through the Interior Parts of North America," the first edition (1778), as well as the more desirable third edition (1781); McCall's "History of Georgia" (1811-16); Haywood's "Natural and Aboriginal History of Tennessee" (Nashville, 1823), one of the rarest of local histories; Hennepin's "Nouvelle Découverte" (1697), with maps and two plates; Joutel's "Journal Historique du Dernier Voyage que feu M. de la Sale fit dans le Golfe de Mexique" (1713), with the rare map; Stith's "History of the First Discovery and Settlement of Virginia" (Williamsburg, 1747); and McAfee's "Late War in the Western Country" (1816), are a few among many first-class items included in this portion. Robert Fulton's "Torpedo War and Submarine Explosions" (1810), with five plates, and "An Account of the College of New Jersey" (Woodbridge, 1764) are unusual books which are likely to bring record prices.

On October 18 and 19, Stan. V. Henkels in Philadelphia sells the eighth and final portion of the library of ex-Gov. Pennypacker. In this sale is offered his collection of books relating to the University of Pennsylvania, including a remarkable series of medical theses. Bibliography and miscellaneous books, mostly relating to Pennsylvania, a series of early lottery tickets, and a collection of American book-plates and tickets of old Pennsylvania book-sellers and libraries make up the sale.

On October 19, 20, and 21, C. F. Libbie & Co. of Boston sell the books of the late C. B. Tillinghast, librarian of the Massachusetts State Library. A collection of books on Arctic exploration, about one hundred lots, including the original manuscript of Scoresby's Journal (1823); a very extensive collection of the works of John Ruskin, first and later editions; a full set of the *New England Historical and Genealogical Register* (1847-1908), 62 vols.; *Notes and Queries*, 132 vols.; Savage's "Genealogical Dictionary of the First Settlers," 4 vols.; and many titles of local New England history are included.

Correspondence.

THE DUTCH UNIVERSITIES.

To the Editor of The Nation.

Sir: It was proper that beside the American celebration of the beginnings of New Netherland and of steam navigation in America, there should also be a Dutch end, so to speak, of the festivities. Amsterdam in 1609 was the point of departure for Hudson, and of the arrival of Bradford and the Pilgrim Fathers. Accordingly in July, 1909, subscriptions in sufficient number and value having been secured, five historical tablets, the gifts of American citizens, were erected at Utrecht, Amsterdam, Nijkerk, Leeuwarden, and Leyden. Of these functions, two were celebrated in universities, two in churches, and one in the legislative hall of the Frisians. At Utrecht, July 9, the trustees, faculty, alumni, and friends of Rutgers College made salutation in bronze to the Academiam Rheno-Trajectinam, as "matrem almæ matris nostræ." John H. Livingston, a graduate of Yale University, and one of the last American students in the Reformed Dutch Church to cross the seas to study theology, took his doctor's degree of divinity at Utrecht University in 1769. Returning home, he became the breath of life to the newly organized college on the Raritan, adding to the old world motto, *Sol justitiæ illustra nos*, the words, *et occidentem*. At Leyden University, a tablet, presented by the Netherlands Society of Philadelphia and the University of Pennsylvania, was affixed to the house in which lived Jean Luzac, famous as a journalist and for the championship of the American cause. Luzac was also a professor in the Leyden University, in which at least one President of the United States, John Quincy Adams, was educated. Of the other tablets, one rests on the walls of the great church at Nijkerk, the home of the Van Rensselaers, whence also came Arendt Van

Curler, founder of the city of Schenectady. The Amsterdam tablet in the English church celebrated the tercentenary of the arrival of the Pilgrim Fathers in the city "where religion was free for all men." The fifth tablet was a "memorial of gratitude," for the first vote taken in the States of Friesland, to recognize John Adams and the United States of America. Leading up to this event in 1781 was the agitation by the students of the University of Franeker, in the same province. As a result, eight million guilders were loaned to the Continental Congress.

Having charge of the presentation of these tablets, I was enabled to renew pleasant associations with the Dutch universities and their professors. A slight comparison of these institutions with those in Germany and America, and a glimpse at the difference of the manner of study and life of the students may not be uninteresting at this time to the readers of the *Nation*.

In their beginning and evolution during the two centuries or more of the republic, the various Dutch universities had each an individual history with notable local differences, for each expressed the spirit of the region in which it was planted. It was the dream of the founders of the Republic, in 1581, to have a university in each of the seven provinces. With sixty-seven years of warfare before them, these hopes were nevertheless fulfilled in five of the States represented in the striped flag—Friesland, Groningen, Utrecht, and Gelderland, with one each in North and South Holland. Under the French dominion, the universities at Harderwijk and Franeker (in Friesland and Gelderland) were suppressed by Napoleon, because of their rather free utterances. It was for much weal and not a little woe, that under the French régime the variety of legal, political, and pedagogical procedure in the Netherlands was vastly simplified—or reduced to a dead level of uniformity. In the process the old local peculiarities of the universities disappeared. The constitutional monarchy, in 1814, did indeed fulfil the hopes of the Republic, but when the universities were reorganized, as part of the national administration, they had lost their peculiarities in large degree and became almost identical in their general features with those of Germany. In each there are the five faculties of theology, law, medicine, science, and letters, only the Polytechnic School at Delft having any courses different. The diversity of method and spirit discernible in Germany, and which is also at once the charm and the drawback of similar institutions in America, is absent in the Netherlands. In the main the description of one, making allowance for age, dignity, and numbers, suits all. Each university has a staff of curators, numbering four or five, appointed by the national government, and the nation's fundamental law forms the constitution under which the universities live. There is no president, but in turn each one of the professors, having reached a certain standing in service, scholarship, and character, becomes rector magnificus for one year.

Of the universities, Leyden stands first in age, honor, size of its faculty, and extent of equipment, and to this first national school all aspiring instructors hope to come. Yet the Dutch have never fallen into the error of supposing that brick and mortar, piled in imposing edifices, make either great teachers or hard students. Many of the professors at Leyden still teach their classes in their own homes. The administration building, with its ancient hallways artistically inscribed, is still that of the old Convent of the Veiled Nuns. Here sits the Senatus or governing body of the university, and here the examinations are held, though there are numerous museums, laboratories, etc., in other parts of the city.

At Utrecht, once so famous for its theology, beside the old hall in which the delegates met to form the Union of 1579, there is a new and handsome building in Dutch Renaissance style used for administration and recitation, containing the theological hall in which the Rutgers tablet was erected. Groningen, the great northern university, lost its main edifice by fire two years ago, but has replaced it by an extremely attractive piece of architecture, also in Dutch Renaissance style, which was dedicated in the presence of Prince Hendrik in July of this year, with the celebration of a *lustrum feest*. In Amsterdam, beside the older school, the Free University, with a small faculty and a meagre list of students, has received national recognition and support under the premiership of the Anti-Revolutionary Premier Kuyper, under whose administration, also, the school at Delft was raised to a national foundation with power to confer degrees. In this latter institution the faculties are those of general science, highways and hydraulics, architecture, shipbuilding and electrical engineering, mining and chemistry. The Royal Academy of Sculpture and Art at Amsterdam, which enjoys government patronage, ought not to be forgotten as a part of the national system of higher instruction.

A glance at the table of the five faculties of the four older universities shows the proportions and reflects the taste and needs of the present generation. There are 136 professors of law, 31 of science, 30 of medicine, and 31 of theology, though strictly speaking only the chairs of the history and philosophy of religion are fully endowed by the State. The drift from theology to law and science, as well as the large increase of students within the last few years, is noticeable, Leyden having about 1,500 students, Utrecht 1,300, Groningen 1,000, and Amsterdam 2,000. Yet with a student body of less than 6,000 for her five million and a half people, the Netherlands do not as yet seem to be in danger of creating an intellectual proletariat.

The Dutch universities, instead of being created at a particular time, as the popular legend concerning the origin of Leyden University might suggest, were direct outgrowths of previously existing schools. Education in the Netherlands is broadly based, and from mediæval times the elementary public schools, sustained by taxation, were open to girls as well as to boys. At the Reformation, these schools were secularized, but the first universities were mainly for the study of theology and the equipment of ministers. They are thus, what the Dutch call them, even with men like Hubrecht, de Vries, Blok, d'Aulnis of international reputation, high schools, and the professors are the higher teachers of the nation.

Dutch student life in its manifestations has some aspects notably different from that in the United States. There seems to be little of athletic interest and comparatively few of those innumerable outside employments or distractions on which American students expend their energies. Other features, which characterize German universities, such as duelling, large investment in dogs and fantastic costumes, except at the *lustrum feests*, are virtually unknown; beer-drinking is not on so large a scale, certainly not so habitual. While there are numbers who seem to take the university course chiefly for social ornament or advancement, the average Dutch student is a serious person, who knows, that in a small country like his, for every professional prize there will be many competitors ahead of him, and it behooves him, therefore, to train well while he has opportunity. In thoroughness, Dutch scholarship falls in no degree below that of Germany. There is little dissipation, and in the smaller university towns, the *café chantant* scarcely exists. Each student corps issues an almanac or year-book, in which, besides local and statistical information, is a large addition, called *mengel werk*, or miscellany of student essays, observations, and jottings of things witty and probably wise. The publications at Utrecht and Delft, at least in 1909, are, in their general make-up and illustrations, much like American publications of the same sort. Apart from these, college journalism is unknown. What concentrates the ambitions and enlists the enthusiasm of the undergraduate body more than anything else, is the costume-processions or *lustrum feests*, reproducing in brilliant colors famous events—the battle of St. Quentin, triumph of Germanicus over the Batavians, etc. These are usually celebrated once in five years in each place, so that every year sees one, and each university has an opportunity to equal or outshine its rivals and predecessor. That at Groningen this year was very fine. At Utrecht and Leyden, the élite of the kingdom, with royalty, are usually found as spectators, and, judging by the way the towns are decorated every year at the time of the commencement festivities, as well as from a knowledge of the local traditions, I gather that there has been, in recent times at least, little friction between town and gown. There being no dormitories, students are closely associated with family life.

It is one great advantage that the universities, being of the nation, are therefore of the people, and open to all. And yet, on the other hand, this very fact prevents the growth of that spirit which is so notably predominant among the alumni of American colleges and universities on private foundations. With us every young man feels bound to his alma mater by ties of gratitude. He is sensitive to his obligation to make returns for her love and care. Consequently, it is the rule rather than the exception for the American educated man, not only to feel indebted, but to give generously in after life of his means, to enlarge and perpetuate the institution that has nourished him. This spirit seems to be conspicuously absent in both British and Continental universities; the reason is plain, but European professors fret in vain over it, while they admire the spirit of Americans.

W. E. Griffis.

Ithaca, N. Y., September 30.

"THE WINTERFEAST" AND "THE VIKINGS AT HELGELAND."

To the Editor of The Nation:

Sir: Some time ago I called attention in your columns to the resemblance in situation between Mrs. Wharton's "Fruit of the Tree" and Ibsen's "Rosmersholm." A more striking instance of indebtedness to Ibsen, which so far as I know has not been pointed out, may be found in Mr. Charles Rann Kennedy's play, "The Winterfeast," which in situations and in setting is remarkably similar to Ibsen's "Vikings at Helgeland."

The action of "The Vikings" takes place about A. D. 933, on the island of Helgeland in the north of Norway. Sigurd, a great warrior, and Gunnar, a man of peace, are foster-brothers. Both are in love with Hiördis, a proud, passionate, ambitious woman, who returns Sigurd's love. Sigurd, in the generosity of his friendship, consents to a device by which Hiördis is induced to marry Gunnar. Sigurd himself marries Dany, the foster-sister of Hiördis. All this has happened years before the opening of the play. In the course of the action, Sigurd visits Gunnar at Helgeland. Hiördis, who has been unhappy with Gunnar because she has been unable to rouse him to warlike deeds, discovers the trick which has been played on her, confesses her love for Sigurd and draws from him a similar confession. Sigurd challenges Gunnar to single combat; but before the fight Hiördis slays Sigurd with an arrow, and throws herself into the sea.

The action of "The Winterfeast" takes place in the eleventh century in Iceland. Bjorn, a great warrior, and Valbrand, a man of peace and a skald, are foster-brothers. Both are in love with Herdisa, a proud, passionate, ambitious woman, who returns Bjorn's love. Bjorn in the generosity of his friendship does not press his suit, though Herdisa confesses her love for him, but sails away to Vinland with Thorkel, Valbrand's father and his adopted father. Thorkel, returning alone, practises a deceit on Herdisa, through which she is induced to marry Valbrand. All this happens before the play begins. In the course of the action, Bjorn, returning from Vinland, visits Thorkel, Valbrand, and Herdisa. Herdisa discovers the trick that has been played on her, and draws from Bjorn a confession that he has always loved her. He ends by reproaching her bitterly, and by challenging Valbrand to single combat. Egged on by Herdisa Valbrand fights with Bjorn, slays him, and in remorse throws himself into the sea. Herdisa dies of a broken heart.

The resemblance does not end here. Thorkel, the aged sea-king in "The Winterfeast," corresponds to Ornulf, the aged sea-king in "The Vikings." Each has a child of his own, a craven; each has adopted a child; the only difference being in the sex of the children. Ufeig, the villain of "The Winterfeast," corresponds less closely with Kare, the villain of "The Vikings"; but, like Ornulf, he loses at one blow his seven strong sons.

Other less important resemblances may be traced. Ornulf in "The Vikings" gains the hatred of Hiördis by telling her that she is Gunnar's mistress, not his wife; Bjorn in "The Winterfeast," rouses Herdisa's hatred by telling Valbrand, in her presence, that she is but his wanton. It may be worth while to add that certain things in "The Winterfeast" which have no counterparts in "The Vikings" have parallels in another of Ibsen's early plays—"Lady Inger of Ostrat." For example, the character of Swanhild, Herdisa's daughter, recalls that of Elina, daughter of Lady Inger.

Of course, there are plenty of differences: Mr. Kennedy has recombined Ibsen's characters and incidents in various ways. But he has not given them any new unity; he has not really made them his own. In every way his play is inferior to "The Vikings." Every character and every motive in "The Vikings" is as clear as day; in "The Winterfeast" the outlines of the characters are as vague and uncertain as are their motives and their states of mind. "The Vikings" is occasionally theatrical; "The Winterfeast" is often theatrical beyond the verge of falseness, and sometimes to the point of absurdity. Take, for instance, Herdisa's interview with Olaf, the son of Bjorn. She wishes some one to avenge her on Bjorn, who, as she supposes, has slain her husband. She has never before seen Olaf; but his resemblance to Bjorn is so striking that it could not escape her were she to see his face. If she learns his relationship to Bjorn, of course she cannot ask him to avenge her. For purposes of plot, then, Herdisa must induce Olaf to swear to avenge her, without disclosing her enemy's name, and without seeing Olaf's face. She therefore talks with him through six pages with her face averted, and the absurd motive which Mr. Kennedy assigns for this is, that she is afraid if she looks at him of finding some sign of cowardice in his face!

The fact seems to be that Mr. Kennedy has helped himself to a good situation and a good set of characters, and spoiled them. The loftiness and intensity of the characters in Ibsen's play give it something of the ethos of tragedy: Sigurd, like Othello, is a strong man, who, through an error, brings destruction on himself and those dearest to him. Beside him, Bjorn and Thorkel are men of straw; so Herdisa is merely a feeble copy of Hiördis. But the failure of the experiment is a minor matter; the resemblances are interesting chiefly as they show how strong is the hold of Ibsen on the imagination of a popular modern dramatist.

Homer E. Woodbridge.

Colorado Springs, October 5.

PERVERTED MEANINGS.

To the Editor of The Nation:

Sir: Mr. Haight, in his valuable remarks upon modern perversions of the meaning of words (the *Nation*, September 16), bears down a bit hard, I judge, upon Tennyson for writing that we rise upon *"stepping stones* of our dead selves." To Mr. Haight the only stepping stones are those by which we cross a stream. This interpretation is altogether too narrow. A "step" is any movement, whether horizontal or vertical. Do we not designate a stairway as a flight of "steps"? In English dialect a stepping stone is a horse-block. The author of "In Memoriam," painfully scrupulous in his diction, had doubtless good warrant for his use in this instance. Again, Mr. Haight has been informed by "certain etymologists" that 'stalwart' is a modification of O. E. *stælwyrðe*, meaning 'worth stealing.'" Webster serves up this extraordinary etymology; who the other sinners may be, I know not. At any rate, it is all wrong. The *stal* stands for O. E. *stadhol*, "foundation," and the compound has always meant *stabilis*, "firm," and the like. Skeat and the Century treat the word correctly.

To Mr. Haight's list of perversions I should like to add one, namely, the flagrant misuse of "to demean oneself"="to degrade oneself." Of course, the fault is due to confounding "mean"="ignobie, base" with "mean"=French, *mener*, "to conduct oneself." One wonders how such folk-etymologists explain to themselves the cognate noun "demeanor." Yet, among others, even Thackeray and Hawthorne have fallen into the trap. See the Oxford Dictionary, which has the air of justifying, feebly, it is true, the usage. Thackeray was not a master-artist in words. But Hawthorne? Well, we can all afford to repeat the Litany daily.

J. M. Hart.

THE TITLE OF "TARTUFFE."

To the Editor of The Nation:

Sir: In reply to a note by The Bibliophile in your issue of the 23d, I should like to call attention to the fact that the Despois-Mesnard edition of Molière's works uses the title "L'Imposteur, Comédie," alleging as a reason that all the older editions do so. And in a foot-note (Œuvres de Molière, Vol. IV, p. 399), "Au feuillet qui précède la pièce, toutes les éditions portent notre titre: Le Tartuffe ou l'Imposteur, sauf la contrefaçon de 1669 et les éditions hollandaises (1675 A, 84 A, 94 B), qui intervertissent l'ordre des mots et donnent: L'Imposteur ou Le Tartuffe." The title of "Tartuffe" was probably always in current usage, as it was the original one, the one used by Boileau (Satire iii, 25), Brossette, and other contemporaries. Molière himself employs it in preference to the other, saying in the second Placet au Roi: "En vain je l'ai produite sous le titre de l'Imposteur," and in the third again he calls the play "Le Tartuffe."

La Grange in his Register speaks of it as "Tartuffe" when he notes its suppression and his journey with La Thorillière to beg the favor of Louis XIV for the unfortunate play. When he records its final restoration, February 5, 1669, the first entry is as "Imposteur ou Tartuffe." Of the total of thirty-three entries at that time two more are under the title of "Imposteur ou Tartuffe," eight under that of "Imposteur," and the remaining twenty-two call the play "Tartuffe." At the resumption after the Easter holidays, the fifteen entries are all "Tartuffe," and later La Grange seems to give up the sub-title altogether.

Mary Vance Young.

Mount Holyoke College, October 6.

[These additional facts about the play are of interest, but do not determine the point as to which was the earliest *printed* title-page. This probably cannot be definitely settled until one or more copies in the original binding can be examined.—The Bibliophile.]

A GLANCE AT THE SEASON'S BOOKS.

How shall we explain the fact that so many publishers are bringing out volumes of reminiscences and of biography—and that so many readers take delight in them? For, as one runs a finger down the list of autumn books, books just issued or on the publishers' ways, it is this department of letters which to us seems richest. Perhaps the lure of the "life" consists, as Anatole France has said, in the fact that *on ne doit rien à la mode—on ne cherche que la vérité humaine.*

Let us pass over one of these new biographies very hastily—and that no other than M. France's own "Life of Joan of Arc," translated by Winifred Stephens (Lane); this notwithstanding that M. France cannot write uninterestingly. We are sure that the same publisher's "Giovanni Boccaccio," by Edward Hutton, makes more edifying reading; so, too, the "Last Journals of Horace Walpole," and Mr. Broadley's "Dr. Johnson and Mrs. Thrale"—these likewise from the Bodley Head. The eighteenth century is not forgotten, it should seem. And here is a two-volume account of "Mr. Pope," by George Paston, and "Dean Swift: an Eighteenth Century Don Quixote," by Sophie Shillcto Smith—both to be issued by Putnam. Forgotten?—the eighteenth will soon be our *grand siècle*, if these writers of memoirs are not choked off. It sparkles in the "Life of Richard Brinsley Sheridan," by Walter Sichel (Houghton Mifflin). It glitters in the "Marie Antoinette" of Hilaire Belloc (Doubleday, Page). Socially, the eighteenth *was* the *grand siècle.*

Of greater import than these memoirs are such "lives" as join novelty to *actualité.* There is sure to be much of interest in Henry M. Stanley's "Autobiography" (Houghton Mifflin), in William Winter's "Richard Mansfield" (Moffat Yard), in Loïe Fuller's "Fifteen Years of My Life" (Small, Maynard), in Eugénie Paul Jefferson's "Intimate Recollections of Joseph Jefferson" (Dodd, Mead), in Mrs. Lecky's account of her distinguished husband, statesman and historian (Longmans). It matters little whether the subject of a happily inspired "life" is actor or minister of state or African explorer: this department of literature is a famous leveller. We are interested in the subjects of these biographies *as people.* Jaded readers must ever find refreshment in vital representations of real life. It is precisely because we know that here, at least, the celebrities involved are actually projected upon the screen of the literary magic lantern that we so keenly anticipate the publication of John Bigelow's "Retrospections of an Active Life" (Baker & Taylor). Besides being an "historical document," Mr. Bigelow's "Retrospections" must express a pungent personality. Other American biographies to be published this autumn have a decided, if relatively slighter, importance; the remark applies perhaps to the "Home Letters of General Sherman," which now assume book-form (Scribner). One may signalize Mr. Parker's "Cleveland" (Century Co.), Mr. Scars's "Wendell Phillips" (Doubleday, Page), and, in the American Crisis Biographies (Philadelphia: Jacobs), Mr. Haynes's "Sumner," and the life of Henry Clay by a grandson of the pacificator, Thomas H. Clay. From Chicago there comes the three volume "Diary of James K. Polk," and a story of "Stephen A. Douglas: His Life, Public Services, Patriotism, and Speeches" (McClurg). Politics "have it" in this field; although there are to be issued for the first time Emerson's "Journals" (Houghton Mifflin). There are, too, plenty of "literary" lives for the insatiable reader of biography. Lepelletier's "Verlaine" makes its appearance in English (Duffield); W. Teignmouth writes of "Dickens and His Friends" (Cassell); Dr. Crothers of Oliver Wendell Holmes (Houghton Mifflin), and Mr. Chesterton of Bernard Shaw (Lane). The choice is catholic enough—and here we but half suggest it.

In the new historical books, there is the same variety. We are to have an account of "The German Element in the United States," by Albert Bernhardt Faust (Houghton Mifflin), and, from the same publishers, a study of "The Expansion of New England," by Lois K. Mathews. The addition to Scribner's series of American texts is, appropriately, Dr. J. F. Jameson's collection of "Narratives of New Netherland." The Putnams issue the ninth and final volume of "The Writings of James Madison," edited by Gaillard Hunt, and "The Biographical Story of the Constitution," by Edward G. Elliott. Edith Tunis Sale's "Manors of Virginia in Colonial Times" (Philadelphia: Lippincott) should have a pleasant flavor. In later American history, one finds an important study of "Virginia's Attitude toward Slavery and Secession," by Beverley B. Munford (Longmans); and James Ford Rhodes has collected a volume of "Historical Essays" (Macmillan). Dr. William Kirk's "A Modern City" (Providence, R. I.) is in the form of a symposium. An account of an American municipality from the standpoint of the economist, the sociologist, and the expert in government, as well as from several other standpoints, it should prove a valuable collection of *mémoires pour servir* (University of Chicago Press). The offering is less liberal in European history. "The Last Days of Papal Rome," by R. De Cesare, in its translation by Helen Zimmern (Houghton Mifflin), "The Birth of Modern Italy: Posthumous Papers of Jessie White Mario," edited by the Duke Visconti-Arese (Scribner)—"The Great French Revolution," by Prince Kropotkin and the final volume of M. Hanotaux's "Contemporary France" (the fourth), both issued through Putnam—"Historical Letters and Memoirs of Scottish Catholics, 1625-1793," by W. Forbes Leith, S. J. (Longmans)—the sixth volume ("The Eighteenth Century") of the Cambridge Modern History (Macmillan)—"A History of Germany, 1715-1815," by C. T. Atkinson (Philadelphia: Jacobs)—these are the most important contributions.

There is, however, bound to be more than quaintness to recommend "Big John Baldwin: Extracts From the Journal of an Officer of Cromwell's Army" (Holt). Wilson Vance is the editor. E. P. Dutton & Company are the publishers of the fourth and final volume of C. R. L. Fletcher's "Introductory History of England: From the Earliest Times to the Battle of Waterloo." We have, in reviewing these volumes, pointed to the strong interest of the narrative. Of a decided contemporary interest in these days is such a book as "The Armenian Awakening," by Leon Arpee: a record beginning with the "Dark Ages" of Armenian history, covering the period since the introduction of Christianity. The University of Chicago Press, the publisher of Mr. Arpee's book, issues a study of "The American Newspaper," by James Edward Rogers—but that is "another story." One mentions it out of course, as it were, by reason of the severity of its criticism. There are, too, the usual quantity of picture books and popular rephrasings of the old, old story—*ça va sans dire.* Where these are cleverly managed as is "Dutch New York," by Miss Esther Singleton (Dodd, Mead), we need not complain.

History of another kind is presented in Dr. Catharine Saunders's "Costume in Roman Comedy" (Columbia University Press). Prof. Harry Thurston Peck writes of this new monograph that it contains, in most convenient form, "a mass of evidence . . . nowhere else accessible." Other works of scholarship are represented in "The Study of Religion in the Italian Universities," by Louis Henry Jordan, in collaboration with Prof. Baldassare Labanca of the University of Rome (Henry Frowde). From the same publisher come also six substantial volumes dealing with "The Sikh Religion: Its Gurus, Sacred Writings and Authors," by Max Arthur Macauliffe. There should be much of novelty here, for the Sikhs are known to us rather as a great military people than for their religious thought. The author was formerly a member of the Indian judiciary. Henry Frowde issues, also, the third volume of Prof. J. E. Spingarn's collection of "Critical Essays of the Seventeenth Century" (1685-1700). In beauty of page and of type, none of the Frowde publications stands higher than the new subscription edition of Homer's "Odyssey," printed in black and red on Kelmscott Press paper from the Greek types designed by Robert Proctor. The text is that of Dr. D. B. Munro, issued by the Oxford Press in 1901.

Travel books we have always with us, and this autumn's publications one may divide into two categories: those which tell of old-world treasures and new-world achievements, books like the "French Cathedrals," by the Pennells (Century), and the "New New York" of John C. van Dyke and Joseph Pennell (Macmillan), highly attractive, but dealing with familiar objects; and those which narrate explorations made and hardships overcome. Among travel books of the more conventional kind, none is more delightful in text and pictures than Mr. Ernest C. Peixotto's "Through the French Provinces" (Scribner). "The French provinces seem ever to unfold new riches," as the artist writes; and after all the half-tones and three-color processes, the soft effects attained in the illustrations here seem doubly beautiful. Yet other books than Mr. Peixotto's have undeniable attractiveness. "A Wanderer in Paris," by E. V. Lucas, is a case in point (Macmillan). Here is joined to many of the useful services of the guide, the charm which belongs to mellow style and regnant humor. "The Bretons at Home," by Frances M. Gostling, enables the reader who is an armchair "Wanderer in Paris" to enjoy a picturesque province scarcely less than the capital (Chicago: McClurg). From France

it is an easy journey into Italy, where Mr. Edward Hutton ("Rome," Macmillan; "Unknown Tuscany," Dutton), and Rodolfo Lanciani ("Wanderings in the Roman Campagna," Houghton Mifflin), and other ciceroncs wait for us, offering wide margins, clear letter-press, and colored pictures. Spain, too, has its illustrated books, and its "Romantic Legends," translated from Becquer (Crowell); and so also Palestine, and even England—with Mr. Howell's "Seven English Cities" (Harper) heading the list—but one must draw the line somewhere. That is our excuse for saying not a word of Mr. Schauffler's "Romantic Germany" (Century), of George Wharton Edwards's "Holland of To-day" (Moffat, Yard) or of Francis Miltoun's "Castles and Chateaux of Old Burgundy" (Page).

And so we fare to those books which describe the "Forbidden Land"—or lands. There is still a flood of them. "Trans-Himalaya" is the title which Sven Hedin gives to his record of discoveries and adventures in Tibet (Macmillan); "The Great Wall of China" is William Edward Geil's inspiration (Sturgis & Walton). But not Tibet, not Japan—though the Lippincotts issue a book about pilgrimages to its art centres, "In Japan," and the author is M. Gaston Migeon, of the Louvre Museum—can stay our modern appetite for Polar literature. Lieut. Shackleton's narrative, "An Antarctic Voyage" (Philadelphia: Lippincott), looms impressive here—thanks, in part, to the beauty of the illustrations. An ex-President's African excursion is the only plausible *raison d'être* for so many books of sport and of exploration on the Dark Continent: we say for so many, not for any individual book. There are, at any rate, too many of them to name, and the only footnote to these notes of the travel books that can be wedged in here must relate to the reprinted "Travels of Four Years and a Half in the United States of America, 1798-1802," by John Davis (Holt), since that is a really noteworthy narrative account of our young America, at a time when travel here was almost as much of an undertaking as it is to-day in Africa itself.

We have not ordinarily thought of Philadelphia as a publishing centre for books on art, but several of the art books issued through the J. B. Lippincott Co. deserve longer comment than we can here suggest. The account of "Manet and the French Impressionists," coming from Théodore Duret, is one of these; so is "Dutch Art in the Nineteenth Century," by G. H. Marius. These works are both translations from the French; one may add the title, at least, of M. L. Solon's "Ceramic Literature: Compiled, Classified, and Described." Sir William Armstrong is the author of a new low-priced—though illustrated—"Art in Great Britain and Ireland," and one anticipates pleasurably the collection of a group of essays by the American painter Birge Harrison under the title "The Art of Landscape Painting." These are Scribner books; so, too, is the magnificent "French Châteaux and Gardens in the XVIth Century," a series of reproductions of contemporary (unpublished) drawings by Du Cerceau, described by W. H. Ward. A number of books on the ceramic and industrial arts are issued by the Putnams and by the Frederick A. Stokes Co.; while coats-of-arms and armor seem to be the great attraction of the Dodge Publishing Co. In another art field there is a study of "American Primitive Music," by the late F. R. Burton (Moffat, Yard); a new book by H. T. Finck, "Success in Music, and How it is Won" (Scribner), and "A Child's Guide to Music," by Daniel Gregory Mason (Baker & Taylor).

It is, of course, in a survey like this, quite impossible even to cite by title the reprints—however attractive the titles, as in the case of the new Mosher books. Even so, the additions to such a series as the Medieval Library (Duffield) shall have a word. These are "The Call of Self-Knowledge," seven early English mystical treatises, edited by Edmund G. Gardner, and "Ancient Christmas Carols, 1400-1700," collected by Edith Rickert. We observe the issue by several publishers of contemporary plays—a tendency that cannot be too highly encouraged. We are glad to see Mr. Zangwill's "Melting Pot" and Mr. Moody's "Great Divide" (Macmillan) put out, and Mr. Mosher's reprinting of plays by W. B. Yeats, to say nothing of similar sentiments induced by reading the announcement of Stephen Phillips's "Dido" (Lane) and Louis V. Ledout's "Yzdra" (Putnam).

Apparently there is to be less fiction read this winter than for the last two or three years. So at least the publishers seem to think. Our list must, however, be even more exclusive than the publishers'; we can only name the titles of Mr. Wells's new story (Mr. Wells is now firmly established as the celebrant of "the lower middle class"), "Ann Veronica" (Harper); of Mr. Hewlett's brace of tales, "The Ruinous Face" (Harper) and "Open Country" (Scribner); of Kipling's "Actions and Reactions" (Doubleday, Page), and Mr. DeMorgan's "It Never Can Happen Again" (Holt). Even so, the "headliners" are not all accounted for. What of Hall Caine's "The White Prophet" (Appleton) and Harold MacGrath's "Goose Girl" (Bobbs-Merill), and Robert Hichens's "Bella Donna" (Lippincott)? It is enough that the new novels will be read; one need not discuss them at too great length; particularly, as some of them are not yet issued. And if, this year, they have been published only by the ton, not, as sometimes, by the carload, that is the novel reader's gain.

Literature.

THE ERROR OF ROMANCE.

The Romantic Movement in English Poetry. By Arthur Symons. New York: E. P. Dutton & Co. $2.50 net.

William Blake. By Basil de Selincourt. New York: Charles Scribner's Sons. $2 net.

It has been known for some time that Mr. Symons was preparing a comprehensive treatise on the English romantic poets, and his earlier, more confined treatises in this field led to the expectation of something rare and beautiful. We are obliged to say that the actual book, if judged only by a comparison with his own "Symbolist Movement in Literature" or his "Plays, Acting, and Music," is a failure. It is true that by a selective process you can find a good deal to praise in its pages. Here and there you are stopped by a metaphor that shows the author at once in the double capacity of poet and critic, as when he says of one of Blake's couplets: "It is no more than a nursery statement; there is not even an image in it; and yet it sings to the brain, it cuts into the very flesh of the mind, as if there was a great weight behind it. Is it that it is an arrow, and that it comes from so far, and with an impetus gathered from its speed out of the sky?" The power of Blake could hardly be better expressed. Again, there is a flash of wit that lets light into dark places, as when he styles Campbell "a sentimental egoist, the Sir Willoughby Patterne of poets," or as when he remarks, by the way, that "Browning offers us busy thinking about life for meditation." That last statement, from one who began his career with "An Introduction to the Study of Browning" and has remained a staunch Browningite, is as surprising as it is illuminating.

Still more penetrating in a way is his confrontation of three verses from Dante with Moore's paraphrase of them in the "Dream of Two Sisters":

> Giovane e bella in sogno mi parea,
> Donna vedere andar per una landa,
> Cogliendo fiori; e cantando dicea—
>
> Methought at that sweet hour
> A nymph came o'er the lea,
> Who, gath'ring many a flower,
> Thus said and sung to me.

Often, as one reads Moore's tripping lines, one is troubled by a sense that they are not poetry, yet cannot quite put one's finger on the defect. By such a juxtaposition as this with Dante, one can see the exact change in diction and rhythm and order by which a noble image is cheapened and made tawdry.

Nor would it be fair entirely to limit the merits of Mr. Symons's work to these scattered points. One or two of the longer sections are excellent critical essays, especially, in our judgment, the Wordsworth, where the reasoned romanticism of the poet, with its alternations of sinking prose and moral elevation, runs sufficiently counter to Mr. Symons's particular kind of romantic unreason to enable him, as it enabled Hazlitt long ago, to write at once with enthusiasm and discrimination.

Notwithstanding these many good points, the book, as a whole, leaves much to be desired. Though apparently exhaustive within its prescribed plan (Mr. Symons waives as unimportant all examination of sources and all comparison with foreign movements), including the names of such nonentities as Tannahill and Brydges, it omits poets essential to the subject, such as Gray,

Collins, the Wartons, Macpherson, and Percy. In dealing with a poet like Beattie, it can overlook his one great stanza—

When the scared owl on pinions gray—

which gives him a high place among the forerunners of romanticism. Despite the elaboration of the work there are signs also of hasty composition, as when one of the paragraphs under Wordsworth is virtually repeated from the introduction. In a word, the writing, while pretending to be systematic, is really haphazard.

But the fault lies deeper than these many oversights, which might suggest that the book had not undergone Mr. Symons's final revision. Here and there a criticism or comparison shows some fundamental error in his judgment. Thus, one may admire greatly the music and the magic of "Kubla Khan," but to use that dream-song as a touchstone for the great human passages of "Don Juan" and to set Byron accordingly below Coleridge, is to ignore the higher, severer offices of poetry for its mere power of mystical evocation. We come closer to the source of error when we turn to the discussion of Blake. "It is true," says Mr. Symons, "that Blake was abnormal; but what was abnormal in him was his sanity." Again: "When Blake said, 'If the fool would persist in his folly, he would become wise,' he expressed a profound truth." Again: "To define the poetry of Blake, one must find new definitions for poetry; but, these definitions once found, he will seem to be the only poet who is a poet in essence." As a consequence and application of these views, one is not surprised at the closing paragraph of the essay, which means nothing, unless it means that Blake is a truer poet than Shakespeare.

We have placed Mr. de Selincourt's "William Blake" beside Mr. Symons's more general treatise, because it points clearly to the false assumptions which lead the romantic critic straight into these gross absurdities. Mr. de Selincourt's work belongs to the Masters of Art series, and a good many of its latter pages are occupied with a discussion of Blake's individual paintings and engravings. But the larger and better part of the volume deals with the principles which underlie his practice of art. On the whole, we regard these general chapters as the soundest criticism yet published of Blake, and as a desirable corrective to the indiscreet panegyrics of Swinburne, Symons, Yeats, Ellis, and the others who have, to a greater or less degree, lost their commonsense in vaporous enthusiasm. To begin with, Mr. de Selincourt is not afraid to sweep away almost the whole mass of the Prophetic Books as rubbish, and until one is bold enough thus to run the gantlet of the enthusiasts, one cannot begin to criticise. He is not afraid also to say flatly that Blake was mad, and that his systematic symbolism, with its hugger-muggery of names, was a sign of this madness. Having thus cleared the way for reason and commonsense, he is ready to bestow the highest praise on the few poems in which the lyrical genius of the poet is unimpeded.

But our concern is not so much with these details of Mr. de Selincourt's criticism as with his remarks on the poetic function of the imagination, which throw a clear light on this whole confusion in regard to Blake's position. We must quote at some length:

> We early derive from our impressions (says Mr. de Selincourt) the unanalyzed conception of experience as an ordered system, and therefore we have only to assume one fact as true to see that the truth of it will involve determined consequences on this side and on that. The power to follow out these consequences, to elaborate a real scheme of coördinate experiences following from or leading up to the fact which we take as our hypothesis, is essentially the imaginative power. It is familiar to us in its application to artistic work; but that is, in reality, only one of the many spheres in which it operates, and the whole fabric of our social life, the entire possibility of further social development, depend on it. . . .
>
> Imagination is in this sense the power which would seem to stand behind our everyday processes of observation, ready to reinforce them. And its reinforcement has the effect, not of withdrawing us from the common objects which our senses perceive, but of introducing us to a far deeper, far more intimate communion with them. To see completely this chair, house, village, mountain, sunrise, is only possible for him who can raise his sensuous impression of them to an imaginative power. And the object is, in effect, thus raised by an action of the mind which provides for it such a context as the mere sense impression has not of itself the means of summoning up. There are as it were images which the mind must draw from its resources and add to the sensuous image actually before it. . . . Imagination is, in fact, the key to all complete experience.

Mr. de Selincourt means that the depth of the imagination is measured by the amount of experience it can focus about a given perception or idea, and he proceeds to show that Blake theoretically—and, by a violence to his nature, practically—treated the artistic imagination as a faculty of escape from experience, and of pure creation within the mind *ex nihilo*. "Imagination," said Blake, "has nothing to do with memory"; and Mr. de Selincourt properly adds: "He was, of course, mistaken; it has much to do with it." This denial of experience, this denial of the imagination as the power of following experience in its logical development, it need scarcely be said, is fundamental to Blake's whole philosophy. Experience, education, law, restraint, discipline, order, logic—these are all, with Blake, merely different phases of the same original sin by which man fell from innocence and the imaginative life; his philosophy of art was in every respect the exact opposite of Goethe's "In der Beschränkung zeigt sich erst der Meister." Mr. de Selincourt does not follow out this thesis as minutely as might be desired, and in one point he falls himself, we think, into a common error. Blake he regards as a mystic, and attributes his failures to mysticism; "for the methods of art and mysticism are not philosophically reconcilable, and no violence of asseveration to the contrary can ever make them so." The error is in supposing that true mysticism is a denial of experience. A sounder study of the great organizing leaders of mysticism would show, on the contrary, that their philosophy was an attempt to expand, not to negate, experience, and that it often went hand in hand with a strong artistic impulse.

But this is by the way. Our main criticism of Mr. de Selincourt is that, having analyzed the imagination so ably and having shown how the grotesque failures of Blake are connected with his systematically false theory of its office, he stops half way and does not apply his analysis to the whole art of Blake. "The central word about Blake," he says, "can never be a word of depreciation. It can never cease to be true of him that he embodied and proclaimed at its purest the impulse of which all art is the issue. . . . He is great among the greatest, because, although the secret is often obscured and buried in his art, he yet knew how to keep himself, as a man, in living touch with it, so that to the end of his life, in spite of the prejudice and arrogance of his egotism, and in the very hour of death itself, *he was a child*." In other words, he stands among the greatest just by reason of that denial of experience which elsewhere Mr. de Selincourt represents as the fundamental cause of his failures. We are quite ready to admit that the central word about Blake can never be a word of depreciation, and if we were writing about Blake immediately, instead of his critics, we should ourselves adopt a different emphasis. We can feel to the quick the exquisite beauty of Blake's best lyrics; they are indeed songs of innocence; but that childlikeness, while the very essence of their peculiar beauty, is the cause also why no sane criticism can place them in the same class with the work of the great poets of experience. We touch here on the question eternally at issue between the classic and the romantic temperament, and in this respect Blake is a kind of touchstone for the sanity of the critic. Mr. Symons accepts the issue and says virtually that Blake is a greater poet than Shakespeare. The impressionism, the haphazard quality of his

writing in this latest book, its lack of coherence and of experience, are in accord with such a critical dictum. Mr. de Selincourt is inconsistent, but by his very inconsistency evokes questions that go to the heart of romanticism.

CURRENT FICTION.

The Old Wives' Tale. By Arnold Bennett. New York: G. H. Doran Co.

Some years ago we noted in these columns an odd story called "Hugo," a whimsical fantasia upon a modern theme. Later we reviewed "The Statue," written by Mr. Bennett in collaboration with Eden Phillpotts. That book puzzled us much; we expressed wonder that Mr. Phillpotts should have had anything to do with such a story. "As soon expect a Hardy to collaborate with a Haggard," we cried, "or a James with a Conan Doyle." "The Statue" was, in fact, trash. It now appears that "The Statue" must have been as much an experiment for Mr. Bennett as for Mr. Phillpotts. "The Old Wives' Tale" evidently expresses his real self.

It is a work of singular sincerity and force. The title seems to be mildly deprecatory of the quality of the tale, which has no necessary beginning or end, no plot, no romantic substance, no spectacular accessories. Its characters have no very striking charm or significance, and there are in effect but three of them, the wife and daughters of a "general draper" in a small town of Staffordshire. Mr. Bennett is a "realist," as we used to say a few years ago, of the highest order. Reservation is as much a stranger to him as sentimentality. He is as leisurely and minute as De Morgan, but he is perfectly consecutive. He never steps out of the narrative to have his chat with the reader: he is too intent upon adding one bit of information to another. The chronicle begins in the age of horse-cars and crinoline, and ends in our own day of motor cars and mushroom hats. A little square in the town of Bursley affords the chief scene, with the shop of Baines the draper in the foreground. The daughters of this man of substance we first see as girls just emerging into womanhood. The elder, Constance—plump, placid, and simple-minded—is predestined to stay at home, to marry the industrious apprentice, and to conserve the traditions of the house of Baines. The younger is a girl of more mettle, beauty, and (from any other than the Baines point of view) promise. In a well regulated romantic novel she would proceed through a delightful series of drawing-room adventures to wedlock with a baronet. Not so the actual Sophia Baineses of life. This one runs away with a pretty drummer, spends a few years of disillusion with him, and is abandoned as an incumbrance. Most of her remaining days, of which there are many, she spends in exile, the mistress of a *pension* in Paris. Does this sound like a dingy story? It is not. With all its length, it would be hard to say where there is a repetition or a superfluity. The story-teller gets his effect by means of a steady accretion of meaning detail, displayed in the light of a humor which is both bland and searching. When he has ceased to speak, there remains nothing for us to learn about these people, body, mind, or soul. For the rest, it is enough to say that there is nothing about them which we are not grateful for knowing.

Mr. Justice Raffles. By E. W. Hornung. New York: Charles Scribner's Sons.

The career of the best-known and best-liked of gentleman-burglars leads steadily upward. In this, the fourth volume devoted to the progress of A. J. Raffles, we catch him in an atmosphere of almost saccharine goodness. Here and there Mr. Hornung makes his hero drop into a bit of mild blasphemy. Now and then faithful Bunny gets snarled at in the old, wild way. But it is clear that Raffles has gotten out of hand, so far as his creator is concerned, and refuses to stay down with Satan. If Mr. Hornung shall ever find it necessary to write a fifth volume, it will be to relate how Raffles robbed the Bank of England to endow an orphan asylum and a free public bath. We are not far from that in the present history of how Raffles engaged in an epic struggle with Daniel Levy, the king of money-lenders, for the possession of the body, soul, and happiness of a young Apollo of a cricket player whom Raffles loved, and of Apollo's father and sweetheart. It is a novel, the first one, we believe, in the Raffles series, but a novel of fairly loose episode in which, after the true epic fashion, the hero and the usurer come in for alternating falls, until righteousness wins out in the end.

If the action drags slightly over occasional half-pages, there is full compensation towards the end in a slashing succession of half a dozen chapters that are positively breathless with midnight burglary, kidnapping, hand-to-hand fighting, and alarum and escape. When Mr. Hornung falls into full swing he gets perceptibly away from the pretty graces of style with which he enmeshes Raffles in his quieter moments. The high merits of the style we would not deny. It is a good deal of a feat to handle a dime-novel situation with something of the Meredithian touch. "And the consummate casuist went on working a congenial vein until a less miserable sinner might have been persuaded that he had done nothing really dishonorable," says Mr. Hornung of Raffles; and A. J. himself says: "There's only one crib that we could crack in decency for this money; and our Mr. Shylock's is not the sort of city that Cæsar himself would have taken *ex itinere*. It's a case for the *testudo* and all the rest of it."

Happy Hawkins. By Robert Alexander Wason. Boston: Small, Maynard & Co.

The publishers' advertisement does what it can to prejudice the reader against this book by calling it "a gripping story of the West." One opens it therefore, expecting the usual ranch and cowboy novel. Abundant, in truth, are ranch and cowboy, guns, gambling-dens—but they all stand for something better and larger than "effects." Happy Hawkins tells his own story in undiluted Western language. His story is so good and he tells it with such a fine capacity for knowing how to do it, that every page does, indeed, hold the interest in a grip that is at first surprise, then admiration, and at last positive affection. The most dialect-weary reader must own that here the dialect is an indispensable charm; and those who stop the ears when American humor is mentioned need have no fear—for here is the thing in its best estate. Melodrama there is, but far more of daily human nature. In an occasional flaming color there is revealed less of theatrical than of the eternal boyish. The question is: Has any novel of the West as good as this been written since "The Virginian"?

The Golden Season. By Myra Kelly. New York: Doubleday, Page & Co.

The intention here seems to be the genial satirizing of conditions in a normal co-educational college in New York city, and the Boswellized Johnson is a certain Elizabeth. In effect, the satire is caricature, and the geniality is of a hard kind nurtured by fibs and by joy in the confounding of others—the fibs and the joy of Elizabeth. Upon a chapter like that of the mothers learning to play kindergarten games, caricature sits easily and extracts a smile without any great pain. But the humorousness of lying is no greater in college affairs than in financial ones. A whole volume of commercial trickery is gloomy, and so is this one as a whole, amusing in sundry spots though it be.

The Master Builders. By James Edmund Dunning. New York: D. Appleton & Co.

The hero of the story is a ship, and hails from Maine, beginning life as a cruiser. When there arise domestic strikes and diplomatic intrigues with a foreign Power, the ship becomes a "mystery ship," and is revealed as "a new type of battleship on lines intended to conceal her character"—"a battleship or two" in disguise. That, in spite of stratagems and treasons, it ploughs its

way to victory was only to have been expected.

The sub-heroes of the action are the rough, masterful man who designed the ship, and the half-brother who idly looked on until the woman, his wife, goaded him to energy and to prodigal-son-like heroism. The wife herself is the most puissant agent of the three. A blonde female spy gleams balefully, but not fatally, from the footlights; a capitalist works his wily way through treason to defeat; Maine natives lend a jocose and fervent hand to the plot. Any one thirsting for machinery and machination may here gulp freely.

RAILWAYS AND BUSINESS.

Railroad Freight Rates in Relation to the Industry and Commerce of the United States. By Logan G. McPherson. New York: Henry Holt & Co. $2.25 net.

Notwithstanding the amount of discussion that has centred in the railway question during the last decade, we know surprisingly little in a concrete, definite way of the traffic service. An admirable statistical picture of our railway system has, within certain limits, been developed by the statistician of the Interstate Commerce Commission, but on the traffic side, he has not yet succeeded in getting anything more than aggregates and averages. No comprehensive commodity statistics have been gathered. One's knowledge of what our railway system is actually doing in the handling of specific kinds of traffic must be gleaned from an occasional article by an expert, from a report of a railway board of directors to its stockholders, or from a perusal of decisions of the commission or the courts in railway traffic cases. Mr. McPherson has, by a first hand investigation of traffic throughout the United States, been able to present a clear picture of the relation of rates to traffic, and the bases, method of construction, and present character of our complicated and delicate rate structures. While his study is condensed, and in some respects incomplete, as must necessarily be the case in a book of reasonable proportions, he has added much to our knowledge of the subject by simplifying for the layman, with great success, a very complex system of rate adjustments. His vigorous style has added to the attractiveness of his treatment.

That he sets out, however, with the mission of teaching the American people the beneficence of present-day railway management seems tolerably clear after the first few chapters. This beneficent service is most clearly seen in the relatively small part which the railway rate plays in the price of the product, and once this is understood by the consumer, all discontent should speedily disappear. Why, for example, should the St. Louis housewife have any complaint, if, when she buys a dozen clothespins, she has paid the railway five ten-thousandths of a cent? As a matter of fact, complaint against high rates is not common, but if it were, this method of answering would hardly be conclusive.

To his surprise, the author finds that shippers of the leading commercial cities and sections are, almost without exception, living in a state of happy contentment. In the few instances, where complaints are still made, they ought to cease either because the railway rate plays so small a part in price, or else because a change in the rate would disturb the delicately and laboriously adjusted rate structure. Quite naturally, the greatest number of complaints is found in the new West, not as the author asserts, because "activity in general is still at the boiling stage," but because the railways have failed to apply to the making of rates in these sections the same principles of equity that are present, for example, in the rates in trunk line territory, where they closely approach the distance basis. He repeats the common statement that coastwise vessels on the Atlantic keep down the rail rates to Southern points. As a matter of fact, there is much evidence leading to the conclusion that agreements exist between rail and water carriers which have kept up these coastwise rates. The most interesting tendency in the present traffic situation is that which is leading toward a greater decentralization of distribution—an increase in the number of interior distributing centres—a tendency which is sure to make for a more uniform and equitable industrial development.

From the existing state of traffic, the author turns to a consideration of rate problems and rate control. Into the history of these questions as they discuss fast-freight lines, pooling, differentials, the basing-point, and the like, we need not follow him, for he is travelling a familiar road; but some points in his treatment of the Interstate Commerce Commission are worthy of consideration. The weaknesses of the commission under the old law and its rough handling by the courts, he exploits in the manner grown familiar from the discussion of the last few years. He asserts that the commission did nothing in fifteen years to stop rebates, and that it was left for Mr. Cassatt to devise his "community of interest" plan, and for the railways to secure the passage of the Elkins Act, before rebating could be done away with. While not overlooking the point altogether, he fails to make clear the difficulties involved under the old law in handling the rebate evil, particularly the decision of the court that departure from a published rate was not illegal, unless it could be shown that some shipper had paid the published rate. The abolition of discriminations and rebates, which he considers an accomplished fact, has had a most beneficial effect in stimulating shippers to a greater watchfulness of their interests, and this finds its response in more prompt and satisfactory service on the part of the railways.

An examination of the docket of the commission since the passage of the amended act leads to the conclusion that the complaints are relatively of small number and of minor significance. It is plain, therefore, says the author, that serious complaints against the railways do not exist, otherwise they would have come to light in these sixteen months since the commission received its enlarged powers—a somewhat hasty conclusion.

With the accounting features of the Hepburn act, he shows little familiarity. An "approximately complete" accounting system was not adopted by the commission on July 1, 1907, but at the present time, two years later, is just nearing completion. That portion of the accounting section which forbids railways to keep any memoranda whatever without the approval of the commission is not working, nor is it likely to work, to the injury of the roads. The commission is not alone interested in revenue and disbursement accounting, but is alive to the importance of statistics as an aid to good administration. This is clear to any one who gives the commission's statistical reports even a cursory examination. The only object which the statute had in mind was to give the commission cognizance in the interest of adequate control of all records kept by the railways, and in this sense has the commission interpreted its powers.

The value of the commission, in Mr. McPherson's view, lies mainly in its ability to disabuse a complainant of the idea that he has a real grievance, and to help out a railway when a decision either way would result in making it unpopular. Further than this, its worth apparently consists in the fact that by reason of its mere existence, a diminution of injustice on the part of railways is likely to result. The author, after a chapter on the achievements of the railways, asks, in conclusion, for a period of calm following the legislative revolution, during which railways and shippers may have the opportunity to adjust themselves to the new conditions—a request which no one will refuse if it involves no backward step.

Our Naval War with France. By Gardner W. Allen. Boston: Houghton Mifflin Co. $1.50 net.

The lack of a careful study of the causes and incidents of this period has long been felt by those interested in our naval history. They will consequently extend to Dr. Allen's little volume

the welcome merited by so excellent a work, with a confidence inspired by his previous account of "Our Navy and the Barbary Corsairs." The hostilities with France, so soon after the alliance which afforded Washington the local superiority afloat he rightly held to be indispensable to the success of our struggle for independence, have been dwarfed by the more vital and dramatic occurrences preceding and following them. Thus their influence on the growth of our navy and the development of our foreign relations has been too often overlooked.

The navy of the Revolution had wholly disappeared; its ships were disposed of; its officers and men discharged. Strictly speaking, the new navy, the navy of to-day, had its birth in the necessity of protecting our commerce against the depredations of the Algerine pirates; but, to the mercantile community, a naval force seemed no less requisite on account of the arbitrary seizure of its shipping by the belligerents in the wars attendant on the creation of the French Republic. While the original bill authorizing the construction of six frigates of forty-four guns each and two of thirty-six guns each, dated March 27, 1794, stipulated that work upon them should cease in case of peace being concluded with Algiers (a condition fulfilled the next year), a supplementary Act of April 20, 1796, permitted the completion of three of these vessels. The activity of French cruisers and privateers is thus directly responsible for the inception of our present naval establishment.

Apparently, the neutral in those days had no rights which the belligerents were bound to respect. He was indeed a lamb among wolves. What the American merchant and mariner had to undergo is thus officially reported in February, 1797, by Timothy Pickering, our Secretary of State:

(1) Spoliations and maltreatment of their vessels at sea by French ships of war and privateers; (2) a distressing and long-continued embargo laid upon their vessels at Bordeaux in the years 1793 and 1794; (3) the non-payment of bills and other evidences of debt, drawn by the colonial administrations in the West Indies; (4) the seizure or forced sales of the cargoes of their vessels and the appropriating of them to public use without paying for them, or paying inadequately, or delaying payment for a great length of time; (5) the non-performance of contracts made by the agents of the government for supplies; (6) the condemnation of their vessels and cargoes under such of the marine ordinances of France as are incompatible with the treaties subsisting between the two countries; and (7) the captures sanctioned by a decree of the National Convention of the 9th of May, 1793, . . . in violation of the treaty of amity and commerce.

The decree of March 2, 1797, provided, for example, that an enemy's goods in a neutral ship should be seized, but the ship herself released; that Americans serving in an enemy's ship should be treated as pirates, and that an American ship, not having its "crew-list" on the approved French form, should be lawful prize. This was surely a pleasing prospect to an American sailor impressed into the British navy! Other decrees issued by local agents of the French government in the West Indies declared American ships lawful prize if bound either to or from British ports. Such measures naturally brought upon our unprotected commerce all the horrors of a mercenary warfare. We are not surprised to learn that the captain of the Cincinnatus was tortured with thumb-screws to induce him to declare his cargo British, nor that, upon his refusal, he was robbed of much of his private property and his store of provisions. Such cases of spoliation were to be counted by the hundreds. An imperfect list in Volume VI of American State Papers gives four hundred and forty-four instances. While the actual loss was great, the humiliation was intolerable. The worm turned at last.

In the spring of 1797, Congress provided additional armament for the protection of American trade; authorized the capture of French armed vessels; suspended intercourse with France, and on July 7 abrogated our treaties with that country. War was never declared, but during the next three years French armed vessels were engaged, American vessels recaptured, French vessels and property taken, and reprisals of all descriptions effected.

At the re-birth of the American navy we were fortunate in possessing in Joshua Humphreys of Philadelphia an able and far-sighted ship designer, whose influence is felt even to-day. To him is due the policy of building craft distinctly more powerful than those of the same class with which they might possibly have to contend. His views were accepted by the Secretary of War, Gen. Knox, then responsible for naval affairs, since it was not until April, 1798, that a separate Navy Department was formed, and placed in the charge of the capable, broad-minded first Secretary of the Navy, Benjamin Stoddert. Had Stoddert's wise and statesman-like recommendations for acquiring a respectable navy been adopted by Congress, the humiliation and bloodshed of the next score of years would doubtless have been largely avoided.

Dr. Allen adds little to our existing general knowledge of the misunderstandings and irritations arising out of our treaty obligations to France, but the details are given more fully and the operations of private armed vessels (quite ignored in the average naval history) are here accorded their proper place and importance. The principal theatre of this quasi war was the West Indies, although spoliations and reprisals occurred in every part of the navigable oceans, from the Straits of Sunda to the British Channel.

It was in Caribbean waters that the new navy won its earliest laurels, when the lucky Truxtun in the frigate Constellation captured the Insurgente and successfully engaged the Vengeance, of greater force, which he would also have brought into port had his spars not been so crippled in the action that his quarry escaped. The brunt of this warfare in the West Indies fell upon French armed merchantmen, which were almost indistinguishable in their acts from pirates, and which, as a rule, abundantly deserved the fate that befell them. Indeed, in this part of the world, and for a long time afterwards, our navy was kept busy in suppressing the buccaneers who preyed on shipping under all flags indifferently. The dependence of our merchant marine upon the navy is shown in Dr. Allen's statement that, during this period, our exports were above two hundred millions, the revenue from our imports above twenty-two millions, and the navy's cost less than three millions of dollars. Unquestionably, a large proportion of this profitable trade would have been lost by spoliation had it not been for naval protection.

Dr. Allen's account of this curious chapter in our history is brief and to the point. It abounds in references to authority; it contains a full bibliography and a careful index; its frequent quotations from the newspapers of that day give it a lively air of actuality; it is well written and well printed. Having erased "The Hostilities with France" from his list of unfinished topics in our naval history, we may indulge the hope that our part in suppressing piracy and the African slave trade will next engage the attention of this painstaking and accurate author.

American Exploration Society: Gournia, Vasiliki and other prehistoric sites on the Isthmus of Hierapetra, Crete. Excavations of the Wells-Houston-Cramp Expeditions, 1901, 1903, 1904. By Harriet Boyd Hawes, Blanche E. Williams, Richard B. Seager, and Edith H. Hall. Large folio. Preface; 60 pp. text, with 44 illustrations; two plans of Gournia, and xii monochrome, and xi color plates. Published by the American Exploration Society, Free Museum of Science and Art, Philadelphia.

This sumptuous volume is a monument of self-denying, scholarly work, and should be included in all reference libraries. The introductory chapters will be especially welcome to the general reader as a résumé of some of the perplexing questions relating to prehistoric Crete and the mainland. In the

"Outline of Minoan Civilization" reasons are urged for the use of the complicated, doubly tripartite "Minoan" subdivisions. Mrs. Hawes gives conjectural dates slightly different from those of A. J. Evans, placing the second period of "Early Minoan" at ca. 2500 instead of 3000 B. C.; the third period of "Middle Minoan" as closing with ca. 1700, instead of 1800 B. C.; and the three periods of "Lato Minoan" as 1700-1500, 1500-1450, and 1450-1200 B. C., respectively, whereas Mr. Evans extends this period to 1100 B. C. Mrs. Hawes treats as "sub-" or "post-Minoan" the period from 1250-1100 B. C. including the transitional, or Homeric Age. The excavations at Gournia point to the date ca. 1700-1500 B. C. or "Late Minoan, first period." Minoan civilization reached its second and greatest climax at about this date (namely 1700-1450). The full splendor of the bronze age is to be associated with a King Minos at this time when the influence, emanating from Knossos, was paramount in the Ægean and along the Greek littoral.

Under the second heading, "Minoans and Mycenæans," the "Mycenæan" civilization is briefly discussed. The steps leading up to "Mycenæan" civilization, the author asserts, have never been discovered in "Mycenæan" countries. The famous Vaphio cups, for example, are probably to be assigned to Cretan influence of this second climacteric of Minoan art. But Mycenæan architecture, as the writer admits, is not so obviously derived from Crete. The "Pelasgians" of the mainland, kindred to the native stock of Crete, were great builders and developed the beehive tombs first on the mainland. Successive bands of Achæans from the north gradually fused with the Pelasgians and introduced their "Aryan" (i. e., Indo-European) institutions, energy, and their all-conquering Greek language. The mainland palaces bear the stamp of greater simplicity than the more "oriental" Cretan, and "possibly of a stronger instinct for proporton, order, and symmetry—an instinct which may be an Achæan contribution." But "Mycenæan" art had its source in Crete, some of it imported by Phœnicians, some of it made on the spot in Greece after Cretan models. A hieroglyphic system of letters, evolved from pictograms, was developed, before the close (1700 B. C.) of the "Middle Minoan" age, into a linear script. The practical Phœnicians, appropriating a short series of signs from Oriental, Egyptian, and Cretan sources for use in their trade, became known as the "inventors of the alphabet" for the Western world.

The next section, "Homeric Problems in the Light of Cretan Discoveries," contains interesting re-statements of some of the old problems, and is more likely to elicit controversy. The conclusion drawn by Mrs. Hawes is that the "Homeric poems are a literary composite of the two (Pelasgic and Achæan) races, as the Homeric Age is a composite of their cultures." By the time of the Trojan wars the whole population of Greece was Achæanized, although in some districts, such as Attica and Arcadia, less thoroughly than in others. Incidentally this falls in with the ancient claim to autochthony of the dwellers in Attica. The author suggests that the martial lays, the nucleus of the Homeric poems, may have been a possession of the Achæans before they mingled with the native stock in Greece, while the "coastal records" (περίπλοι, *not* proparoxytone), furnishing material for the "Return of Odysseus," belonged to the older races of the Ægean long before the earliest known Phœnician period.

The text accompanying the beautiful and carefully drawn plates elucidates for the benefit of specialists the numerous objects and pottery discovered at the sites excavated. Those from Vasiliki belong to a much earlier period than those from Gournia, being assigned to "Early Minoan, second period," about 2500 B. C., or contemporary with Dr. Dörpfeld's second or burnt prehistoric city at Hissarlik.

Ireland under English Rule; or, a Plea for the Plaintiff. By Thomas Addis Emmet, M.D., LL.D. New York: G. P. Putnam's Sons. $5.

Although announced as a second edition, these two volumes really form an almost entirely new work. The second volume, especially, which brings the historical narrative down to the present time, covering the period during which the Irish people have been strictly under English rule, is wholly based upon fresh material. Dr. Emmet has written an eloquent and scholarly plea in favor of Ireland. He never allows his indignation to get the better of his critical judgment, and his indictment is drawn with an evidently sincere effort at fairness and impartiality. He is not tender to the failings of the Irish, and admits candidly enough that some of their racial defects are largely responsible for their misfortunes. But he also insists that, even down to the present day, Ireland has been badly known and badly judged.

He refutes an opinion generally accepted until quite recently that the Irish before the Elizabethan conquest were an indolent people, governed by barbarous laws, and hopelessly superstitious. We are beginning to learn that, from the twelfth to the sixteenth century, Ireland was a country enriched by commerce, which kept up active economic relations with the Continent, produced literary men, scholars, and artists, and made for itself a place in the history of civilization. The ordinary principles of political economy will not enable us to understand its fall after the Tudor conquest. The brutalities, errors, lack of tact in even well-meaning Britons, sufficiently account for the misery of the distressful island during the last three centuries. The palliative measures of the last half of the nineteenth century always came too late, were granted grudgingly, and, admittedly, as concessions to threats and violence. An English statesman has said that Ireland should forget, and England remember. But oppressed nations have long memories, and the hostility generated by ages of cruel tyranny cannot be appeased in a day. It is to be hoped, however, that the transfer of the land to the people and the other remedial acts passed during the last couple of years will in time mitigate the bitterness of the antagonism between the two nations. After all, the Irish do not hate the English as ferociously as the English and Scotch hated each other during the eighteenth century, and some time in the near future we may find the two peoples living harmoniously together and working out their common salvation in a great federal union.

Of decided interest, especially at the present moment, is a casual allusion to Robert Fulton in the Diary of Thomas Addis Emmet, the grandfather of the author, printed at the end of the second volume. Emmet resided in Paris, from May, 1803, to March, 1804, as the agent of the Irish revolutionists, vainly trying to persuade Napoleon to send an expedition to Ireland. One of the entries is the following:

> Saw Robert Fulton, who promised if the affair should become so serious as to leave him room to work, he would go over and commence his plan of operations with his torpedoes.

The work contains an exhaustive index, and these two substantial and instructive volumes can be recommended as a reference-book to those interested in present-day Irish events.

Post-Augustan Poetry from Seneca to Juvenal. By H. E. Butler. New York: Henry Frowde.

The title of Mr. Butler's book arouses great expectations. The lamented death of Sellar cut short that scholar's plan of treating the Latin poets in a series of essays; the last was on Ovid, and that only partly done. Mr. Mackail wrote the book on Latin literature that had been intended by his master Sellar; brief as it is, it forms with Sellar's works the best introduction to Latin verse and prose that exists in English. We wish that Mr. Mackail had continued Sellar's larger undertaking as well. Information sufficient is given in manuals like Cruttwell's, but the style

of this writer is unpleasantly diffuse. Simcox is always good reading, but is so copious in epigram that dull subjects under his treatment have the value of great ones; we query whether we are getting the Latin poets, or all the clever things that Simcox can say about them. Nisard's immature work, "Etudes sur les poètes latins de la décadence," which even after the alterations of his second edition he considered youthful, is excellent reading, and has not unnaturally served as the basis for various later estimates; but as Nisard admitted, its judgments are unduly severe. In fine, we are ready for a new treatment of the Post-Augustans in the manner of Sellar.

Mr. Butler's book follows Sellar's chronologically, except that he omits Manilius and Phædrus. He has worked at his task conscientiously. He almost says that he read through the seventeen books of Silius Italicus, and he even devotes a section to "Lost Minor Poets." He gives clear and readable accounts of the poets' lives. For much of his information he draws inevitably on "those great works of reference, Schanz and Teuffel," and with a few exceptions only—notably in his account of the "Panegyricus" on Calpurnius Piso—he is abreast of recent studies. He has also the laudable intent of remedying the neglect and malediction which certain of the later poets have met; he means "to detach and illustrate their excellencies without in any way passing over their defects." This is a proper starting-point for criticism, and Mr. Butler shows good taste in discriminating evil and good. The illustrative examples are well selected; not a few of them have never appeared before in treatises on Latin poetry. As the text is accompanied by translation, they will give the English reader who knows Mackail further insight into most of the poets discussed. Finally, Mr. Butler has the benefit of Mr. Gilbert Murray's criticism; the latter read through the book in manuscript.

But somehow Mr. Butler's work lacks the flavor of the essay—the all-essential quality in an undertaking of this scope. The different parts of his sketches are not well fused; they remain subdivisions, as they rarely are in Simcox and Nisard. He gives us no literary criticism in the large. Isolated observations occur that strike the reader's attention, such as the remark that stoicism "prescribed the brotherhood of man and took away half the value of sympathy." But there is no enlightening discussion of the larger literary problems; he does not grasp the significance of Calpurnius's pastoral, or detect the most significant difference between the satire of Juvenal and of Horace, or throw light on a matter that cries for interpretation—the plot of Lucan's epic. The chapter on Valerius Flaccus is one of the best in the book, perhaps because the subject lends itself to Mr. Butler's methods; but on the authors who deserve the most—Juvenal, Martial, Lucan—he is least satisfactory. Nor has he the gift of the phrase; "straining for effect," "slavish imitation," "meretricious display"—these catchwords have become as tiresome as the faults to which they are applied.

In justification of the unfavorable part of our criticism, we may add a quotation, which suffers from ill-digested metaphor, and from a failing still more serious:

> He [Valerius Flaccus] is obscure, he is full of echoes, he staggers beneath a burden of useless learning, he overcrowds his canvas and strives in vain to put the breath of life into bones long dry; in addition, his epic suffers from the lack of the reviser's hand. And yet, in spite of all, his characters are sometimes more than lay-figures, and his scenes more than stage-painting. He has the divine fire, and it does not always burn dim. Others have greater cunning of hand, greater force of intellect, and have won a higher place in the hierarchy of poets. He—though like them, he lacks the "fine madness that truly should possess a poet's brain"—yet gives much that they cannot give, and sees much that they cannot see.

This is mock discrimination, suggesting the false antithesis of the rhetorics. What is the mysterious something that Valerius, but not his superiors, can give? And how differs the "divine fire," which he has, from the "fine madness," which he has not?

Not all of the book is as bad as this; pages of interesting description and helpful comment might be cited. But it contains nothing new for the scholar, and will not, we fear, gain the wide popularity deservedly won by Sellar and Mackail.

Biblical Criticism and Modern Thought: or, The Place of the Old Testament Documents in the Life of To-day. By W. G. Jordan, Professor of Hebrew and Old Testament Exegesis in Queen's University, Kingston, Canada. New York: Imported by Charles Scribner's Sons. $3 net.

Professor Jordan in this book emphasizes the fact that criticism was never a mere conceit of perverse and unbelieving minds, but was made necessary to lovers of the Book by the advance of knowledge which furnished both materials for work and problems for solution. Criticism has not made an attack upon religion, but rather upon the dogmatic views which limited the religious life as it sought to expand under the vital impulses of the nineteenth century. Religion, the author believes, is deeper than formal creed or church machinery, and the Bible which literary and historical criticism has found and seeks to interpret, is vastly more capable of ministering to man's religious needs than was the Bible of proof-texts and verbal inspiration.

Professor Jordan justly resents the attempt to bring literary criticism into disrepute by over-emphasizing divergences in the results of archæological discovery. There is no considerable opposition in the results obtained in these different fields, and it is noticeable that those who attempt to set up such an opposition are unskilled in the use of their materials. Professors Sayce and Hommel receive some well-deserved censure for their too-ready compliance with popular orthodox demand, and the author has not scorn enough to pour out upon that dabbler in all things critical and archæological, Professor Orr, whose "Problem of the Old Testament" would have confused all Biblical problems tenfold, had students of the Bible taken him seriously. Just as timely and earnest also is the protest our author makes against relegating Hebrew history to a subordinate division of Assyriology. New light bearing on the literary and political development of the Hebrews has come in great abundance from the Tigris-Euphrates valley, but, after all, the Hebrew people have made a specific and peculiar contribution to the life of the world, which can only be understood and interpreted from their own literary documents. Whatever materials they received from older civilizations—and the debt is great—they stamped with their individual genius. Perhaps the best chapters in the book are those devoted to "Struggles and Survivals" and "Historical Development." Here the author finds more freedom in discussion and makes a fine apologetic for the evolutionary view of religion.

The least satisfactory part of the book is that dealing with "The Message of the Prophets," partly, to be sure, because here we expect the most. The chapter lacks the glow and fire which must characterize any effectual presentation of the work of these great men. Yet as an aid to a better understanding of critical methods and results, this book has genuine value, and it will doubtless prove an incentive to more thorough preparation in Biblical studies on the part of preachers, to whom it is mainly addressed. Perhaps it was, in the present state of thought on the subject, quite to be expected that there should be repetition and a good deal of special pleading.

Rasplata (The Reckoning). By Commander Wladimir Semenoff. New York: E. P. Dutton & Co. $3.50 net.

The latest contribution to the history of the Russo-Japanese war is by an officer in the Russian navy whose personal experiences are now set before us in an excellent translation. It is unfortunate that among the very first books on the

recent war laid before the English-speaking public, at least two should have been imaginative compilations pretending to a first-hand knowledge of their subject. As a result, suspicion attaches to every subsequent account of the war in the Far East claiming to emanate from a Russian eye-witness. We are not quite sure that the diary upon which Commander Semenoff bases his picturesque story of the Port Arthur fleet and the voyage of Admiral Rozhestvensky ever existed. We are not even sure that there is such a person as Commander Semenoff of the Russian navy. Internal evidence points both ways. The high literary excellence of the book argues a hand more trained to the pen than to the sword. The very precision of detail suggests an observer making his notes in the calm of a well-stocked library rather than on the unquiet fighting-deck. On the other hand, it is hard to conceive a mere compiler's catching the vivid touch of reality, the color, and the swing that mark the present narrative.

Whatever may be the case, we have in the bulky volume before us an exceptionally readable account of Russia's naval campaigns, written from the anti-governmental standpoint, with much grasp and authority and without excessive prejudice. The main facts are not new. It is the oft-repeated story of official lethargy, incompetence, and timidity which brought ruin on Russia's Port Arthur squadron, and then sent out the Baltic fleet to meet a similar and even surer end. In the diary of Eugene Politovsky, chief engineer on Rozhestvensky's flagship, we have already had a vivid account of the ill-fated voyage from Libau to Tsu-shima (see the *Nation* for May 2, 1907, p. 415). Commander Semenoff fills in the earlier story with much interesting detail, but adds little that the general reader would consider essential. His treatment of the naval campaign about Port Arthur covers fresher ground. The diary method is exceedingly effective here, without the appearance of any straining for effect. Minutiæ of naval technique are skilfully blended with much real fighting, a great amount of psychological data, and a good bit of denunciation.

The one figure that stands out in pleasant relief is that of Admiral Makaroff. What would have happened if Makaroff had not perished a few short weeks after he assumed command of the Port Arthur fleet, constitutes the one great "if" in which many Russians, our author among them, find some measure of consolation. Japanese luck from the very beginning of the war only meant Russian stupidity and neglectfulness. Had Makaroff lived, it is Commander Semenoff's profound conviction that luck would have speedily begun to distribute her favors more equally between the combatants.

Notes.

"The Motor Routes of England" is the subject of a new book by Gordon Horne, published with maps, plans, and illustrations, by the Macmillan Co.

"The Earthly Footprints of Jesus," sermons on sacred sites and scenes, by the Rev. H. D. S. Sweetapple, is promised for publication by Thomas Whittaker.

"Going Down from Jerusalem" is the title under which Norman Duncan's account of travels in the Holy Land is to appear, with the imprint of Harper & Bros.

On October 16 Houghton Mifflin Co. publishes a novel whose scene is twelfth century troubadour-land: "The Severed Mantle," by William Lindsey.

On March 11 of this year, we reviewed "The Gilds and Companies of London," by George Unwin, from a copy sent to us by the London publisher. The book is now on the regular imported list of Chas. Scribner's Sons.

"Pickwick" is to have yet another embodiment, Chapman & Hall (London) announcing its issue in two volumes, with all the original illustrations, besides 250 new ones. The additional pictures represent the places and characters from whom Dickens drew his imaginative sketches; and are gathered together from the collections of Mr. C. Van Norden and others. The notes and other matter of the "Victorian Edition" (edited by C. P. Johnson) are to be included.

Prof. Albert Schinz, writing in the *Monist* (October), offers a comprehensive treatment of "Jean Jacques Rousseau as a Forerunner of Pragmatism," and, specifically, of William James. In dealing with Rousseau's position with reference to the most contemporary of philosophies, Professor Schinz defines pragmatism as "a philosophy that judges of the value of theories and ideas from their consequences—*i. e.*, from the practical results which they yield to the thinker when he proceeds to apply them to reality." His comparative study of Rousseau and Professor James extends even to the length of developing a parallelism in their philosophical evolution.

The note of cosmopolitan scholarship is struck in the most recent additions to the Harper's Library of Living Thought, which are, in each case, English translations of continental treatises. We have two translations by the Rev. H. J. Chaytor, M.A., headmaster of Plymouth College: Bertholet's "Transmigration of Souls" and Becker's "Christianity and Islam." The "Jesus or Paul?" of Dr. Arnold Meyer of the University of Zurich is Englished by the Rev. J. R. Wilkinson M.A., while a translation of "The Origin of the New Testament," by Dr. William Wrede, professor of New Testament exegesis in the University of Breslau, is the work of James S. Hill, B.D. Perhaps the most interesting of these recent publications in "The Library of Living Thought" is "The Life of the Universe," by Svante Arrhenius of Stockholm (translated by Dr. H. Borns). Though this work is issued here in two volumes, the total number of pages is not great, nor are those pages large; and in small bulk Arrhenius has sketched the conception of the universe from the very beginnings. The illustrations are of an added interest, and will increase the attractiveness of this excellent popularization.

The "Wayfarer in New York" (Macmillan) is a little anthology of prose and verse, which attempts to bring out the romantic aspects of this city in something the same way as was done by "London's Lure" this season, and by E. V. Lucas's anthology some time ago. The field, as compared with that of London, is narrow, but the editor has succeeded in making a thoroughly readable volume. He could have done even better if he had not overlooked a number of striking poems and prose extracts—N. P. Willis's "The shadows lay along Broadway," for example, to which Poe has given no more than its just praise. Edward S. Martin has written a charming introduction, which is really one of the best things in the book. What could be neater than his opening words: "New York is a frontier city, situated about half-way between San Francisco and London"?

The "Life, Letters, and Journals" of George Ticknor, originally published some forty years ago, is now brought out by Houghton Mifflin Co. in two volumes, with a number of new illustrations. It may seem superfluous to praise a biography which has long been known as a classic of American literature, yet these classics are perhaps today just the books that need to be brought to general notice. The first volume of these memoirs is delightful reading, and one of the richest treasures in the language for anecdote and characterization of the period. Byron and Talleyrand and Madame de Staël and Humboldt and most of the great lights of the age—not to mention princes and princesses—were pleased with the company of this engaging young American, and talked to him with surprising intimacy. But even better than these anecdotal paragraphs is the account of student life at Göttingen, Ticknor being one of the first of our scholars to seek German training. The second volume falls off somewhat in interest, but is not without various attractions. Altogether, the book can be recommended to those who have not read it as one of the things not to be overlooked. Ferris Greenslet furnishes a happily turned introduction to this new edition.

Sir Charles Santley, who had already more than satisfied the public curiosity in regard to his personal history, has picked up another basket of chips and published them under the title of "Reminiscences of My Life." (Brentano.)

"From My Youth Up" is the title aptly given to her reminiscences by Margaret E. Sangster (Fleming H. Revell Co.). We have read some of these pages with very genuine pleasure, and one such page is that which tells of the old-fashioned prejudice against fiction—particularly as Sunday reading. "My sister and I were young girls when 'Uncle Tom's Cabin' appeared," writes Mrs. Sangster, "and it is not too much to say that it took us by storm. I began reading it on a Saturday afternoon, unfortunately for myself, and at late bedtime laid it reluctantly down. To finish an exciting book of this kind on Sunday was a thing almost impossible, considering

the habits and convictions of the household and my youthful principles. Nevertheless, on Sunday afternoon, as the book lay upon the bureau in my room, I could not resist the desire to peep into it and read just a little more about little Eva and Uncle Tom. To read standing did not present itself as quite so wrong as to read comfortably seated in a chair." Notwithstanding the undeniable thinness of certain chapters here, and the occasional ornateness of the writer's style, there is a quality of homely moral earnestness in this autobiography that will, with its flavor of sentimentality, endear it to a host of readers. The amiable personality of a writer the characteristics of whose earlier writings this loosely-strung narrative repeats, rather than the anecdote of Mr. Howells's pouring tea, or the account of Tennyson's poetry ("so profoundly philosophical, so devoutly religious, and so finished in style and diction, . . . like a great cathedral lifting its glorious height and its tapering spires to the vaulted sky"), guarantees this book popular acceptance.

Thoreau's "The Maine Woods" now makes a reappearance with an introduction by Clifton Johnson, and thirty-odd photographs of the excellent kind which we associate with Mr. Johnson's name (Thomas Y. Crowell & Co.). Such persons as ordinarily find the illustrations of their favorite books a distraction, even a desecration, will be first to enjoy the photographer's visualization of just those scenes and natural objects which were dearest to Thoreau himself. The Maine woods are today no such *terra ignota* as in the lifetime of Thoreau; the most hardened metropolitan is likely to have paddled their rivers and shot their moose. It is not, then, very surprising that the public should show a widening interest in chapters which the author himself published only in the magazines—when he was able to publish them at all.

John Sheepshanks, now Bishop of Norwich, was from 1859 to 1865, the rector of Holy Trinity Church in New Westminster, British Columbia. From his diaries and letters, the Rev. D. Wallace Duthie has compiled a narrative, eking it out with interpolations of his own ("A Bishop in the Rough," E. P. Dutton & Co.). The young clergyman was of the heroic, muscular type, sincerely devoted to his calling, but otherwise indistinguishable from the army of colonizing younger sons, enjoying his hardships and dangers, at home with all sorts of men and conversant with a gun. When one has read of the zest with which he met the adventures that diversified the cure of souls in the Northwest in the sixties, one is not surprised to find that when the time came for his return to England the homeward journey took two years and included the Sandwich Islands, China, Mongolia, the Grand Llama and the Siberian post-road.

In the last quarter of a century many English women have broken away from the traditions established by Miss Strickland in her "Queens of England." Among the most noteworthy of these are Mrs. Sidney Webb, in her various works of collaboration with her distinguished husband, and Mrs. Dale, who a few years ago wrote a work entitled the "Principles of English Constitutional History." A new aspirant for like honors has now come forward, Miss A. M. Chambers of the Bedford High School, who has recently published, through the Macmillan Co. "A Constitutional History of England." If the main object of the work is to impress upon the British public the ability of women to think constitutionally, then it is successful, for the subject is presented with understanding, and with a considerable degree of fairness and good judgment. Miss Chambers has read her authorities with intelligence, and falls into few errors. But if it is the author's aim to supply a work that shall be of use to teachers and students, then she has failed, for her work fills no special gap. Its method of treatment, which is that of Medley's well-known manual, is not one to be commended, as such a topical and sub-topical arrangement destroys the essential and necessary aspects of continuity and development, and is always confusing to students. Because of its plan, the book is wrongly entitled a history; it might more justly have been called "Aspects of the British Constitution, Historically Treated," or "A Compendious Cyclopædia of English Constitutional History." As a reference book, the work is handy and useful, though it is necessarily incomplete. It is well written and in good taste, but is quite devoid of originality, and the author seems to be lacking in the power of interpreting her evidence. For that reason the book does not hold the attention of the reader. It has the faults of Medley's manual without its merits, and another work along these lines is not needed. It is a pity that Miss Chambers could not have taken Montague's elementary work as her model, and in clear and simple language have produced, on a larger scale, a constitutional history for schools based on the best authorities, with bibliographies and comments.

"Confessions of a Macedonian Bandit," by Albert Sonnichsen (Duffield & Co.), furnishes delightful reading. The only criticism to be made is that it should have been longer, for Mr. Sonnichsen gives barely enough information concerning the feuds and counter-feuds, plots and counter-plots, of the various revolutionary factors at work in Macedonia and across the frontier in Bulgaria. Certainly, his position as special adviser to the Macedonian Revolutionary Committee in Sofia gave him a unique opportunity of explaining those troubled events. There is, nevertheless, an atmosphere about the book which brings home to the reader, with a force of which the author is evidently unaware, the pitifully appalling nature of the struggle against Ottoman rule. It shows, too, with startling clearness, the difficulties of a passionate primitive people in their first unaided effort at self-government, an underground self-government at that. Here and there throughout the work are paragraphs and chapters that cast sidelights on the Bulgar character; and every page is shot with the peculiar dry humor of the man who is used to facing danger. Perhaps the best bits in it are those which tell of the surprise of a cheta and the death of Sandy, the author's comrade, and the personal narrative of the chief who kidnapped Miss Stone. For sheer humor, it would be difficult to surpass the latter incident. A number of photographs help to convey an idea of Macedonia and the Macedonians during the tense period of four or five years ago.

Examination of the third and fourth volumes of "The New Schaff-Herzog Encyclopædia of Religious Knowledge" (Funk & Wagnalls Co.) confirms and strengthens the judgment that the completed work will prove valuable for reference, especially in the field of church history and ecclesiastical biography. The editors are doing their work well, and the contributors include many of the most competent scholars of Germany, Great Britain, and America. The bibliographies are exceptionally good. Noteworthy articles in the third volume are "China" by Arthur H. Smith, "Christology" by D. S. Schaff and C. A. Beckwith, "Comparative Religion" by George W. Gilmore, "Concordats" by Carl Mirbt, "Creation and Preservation" by O. Zöckler, "Divorce" by George E. Howard, and "Dogma" by A. H. Newman. In the fourth volume one notices "Duns Scotus" by R. Seeberg, "Jonathan Edwards" by Frank H. Foster, "Erasmus" by Ephraim Emerton, "Enlightenment" by Ernst P. W. Troeltsch, "Eden" by Robert W. Rogers, and "Paulus Gerhardt" and a number of biographical titles by Carl Bertheau. The encyclopædia continues to evidence fair, non-partisan, and thorough scholarship, broadly evangelical in spirit, and scientific in temper. There are few articles of extreme length, and salient information is furnished in compact form, with accurate and abundant references to original documents and competent authorities.

To exhibit the diverse sources out of which the English Bible has grown, the contributions from Reformers and Humanists, Catholics and Protestants, orthodox and liberal, and to demonstrate that the Bible is "the most catholic thing in all literature," is the object of the Rev. Samuel McComb, D.D., in "The Making of the English Bible" (Moffat, Yard & Co.). The story is succinctly told, yet with emphasis where it belongs, and with sufficient illustration by way of parallel texts and exhibition of relationships. Dr. McComb contests that the present English versions are by no means final, but that the achievement of a better Hebrew text, more careful study of the Western group of New Testament manuscripts, and especially the discovery of Egyptian papyri, will result in subsequent versions which will embody many improvements in rendering the thought of the original, if not in finish of literary form.

One of the most perplexing problems in connection with the early history of Christianity is that of the Jewish Christians, and for that reason the work of Dr. G. Hoennicke, of the University of Berlin, entitled "Das Judenchristentum im 1 und 2 Jahrhundert," is particularly welcome. The lack of sources and the syncretic character of the several groups of Jewish Christians are the chief cause of these difficulties, and Hoennicke has evidently been successful in doing the best possible under the circumstances. (Berlin: Trowitzsch & Sohn).

Many teachers now prefer the Oxford (Clarendon Press) to the Teubner classical texts on account of the superiority of paper and type and the convenience of having the critical apparatus at the foot of the page. The Herodotus of Carolus Hude, of

which the second, and final, volume has now appeared, maintains the standards of the series. It records the readings of the Laurentian (LXX), the Roman, and the Vatican MSS., with selections from others, and a few new conjectures by the editor and by Theodor Gomperz. Professor Hude's aim is to reproduce the forms of the archetype manuscript rather than to impose upon the text any rigid theory of the Herodotean dialect. In the second volume the chapters have been subdivided into smaller sections for convenience of reference. This treatment will be extended to the first volume when a second edition is called for.

Whoever recalls Goethe's illuminating characterization of his mother tongue as *unglücklich* and even *barbarisch*, and his loud lament that, as poet, he was compelled to work with such a tool, will find considerable interest in Prof. Johannes Seiler's new book, "Die Anschauungen Goethes von der deutschen Sprache" (Stuttgart: J. C. Cotta), which has been awarded the annual medal of the Deutscher Sprachverein. To be sure, Goethe's tirades against the German language fall chiefly within the decade between 1780 and 1790, when he was busy with the problem of bringing over into German some of the treasures of other literatures, and was chafing under the contrasts between the rugged German and the more musical Italian. Although far from intending to give his days and nights to philology, Goethe seems, as a student, to have interested himself in the study of grammar and the questions of orthography and etymology then agitating scholars, and so it was natural, perhaps, that he early appreciated the study of dialects, recognizing their literary value, and maintaining the right of an author to compose in them. This makes it the more remarkable that he should have failed to observe dialectical conditions about him. As the expression of ideas, the inner feelings, Goethe laid but little value on language, maintaining that language generally, and perhaps the German language more than some others, fails to express adequately the real thought, with the evil result that the truth has no fair chance of utterance. More important than language, in the usual acceptance of the term, is *das Handeln*, or the language of Nature, and Goethe would emphasize spoken, rather than written language, holding as much as possible to the conversational style, even in writing. This probably accounts for his preference for committing his thoughts to paper through the medium of a secretary. Goethe considered the German language sufficient only for those in the middle station of life, without extended education, and maintained that the more highly cultivated person would find other languages necessary—the one for one purpose, the other for another. Goethe believed in literary translations, however, even while maintaining their inadequacy, and thought the English language so nearly related to German as to offer, notwithstanding some difficulties, much encouragement to translator and philologist. Goethe's knowledge of English remained very limited, as compared with his understanding of other languages, ancient and modern, although, as he remarks in his "Italienische Reise," he believed that English could be easily learned.

Sophie Jewett, assistant professor of English literature in Wellesley College, died at Buffalo, N. Y., October 11. She was born at Moravia, in the same State, June 3, 1861, and has held a position in the Wellesley faculty since 1889. Miss Jewett was the author of "The Pilgrim and Other Poems," the editor of one or more texts, and a frequent contributor to the magazines.

Napthali Herz Imber, the East Side poet—one might almost say the East Side Verlaine—died in New York city on October 8. His youthful poem "Hatikvah," expressing in simple lines the longing of the Jews to return to Palestine, became the Jewish national hymn; and its author has always been a picturesque figure at the Zionist conventions, wherever held. Born in Bohemia, the author was always a "Bohemian." At one stage in his checkered career he was associated with Israel Zangwill in publishing a short-lived weekly magazine in London. In this country, he posed as a mahatma, a "wise man of the Indies," and delivered ecstatic lectures on the Buddhist and Hindu religions. Imber's true philosophy was, however, that of Omar—as popularly interpreted.

Science.

The Making of Species. By Douglas Dewar and Frank Finn. New York: John Lane Co. $2.50 net.

A reader might well be pardoned for laying aside this book after reading in the preface a few such passages as the following:

We fear that this book will come as a rude shock to many scientific men. By way of consolation, we may remind such that they will find themselves in much the same position as that occupied by theologians immediately after the appearance of the "Origin of Species."

Fortunately, however, the bark of Messrs. Dewar and Finn is much worse than their bite. The book is in no way revolutionary; and it has singularly few of the faults and many of the real virtues peculiar to amateur science. The authors have a good acquaintance with the literature of biology and most of the important tendencies of the time receive due attention (with the exception, perhaps, of the work of the palæontologists on orthogenesis). They are in general accord with the position of most judicial biologists in recognizing the importance of natural selection as a sifting force, while emphasizing the fact that the origin of species requires the intervention of other agencies, among which more or less definite mutations and the factor of isolation are of obvious importance. Their own special contributions to the subject consist of valuable sidelights thrown upon the problem of evolution by the practical experience of the field naturalist (both have studied ornithology in England and in India), and by a somewhat indiscriminating survey of breeders' journals.

The objections to natural selection as an all-sufficient agent in species-forming are first reviewed (following Kellogg). Then come chapters on variation, hybridism, inheritance (with a suggestive analysis of heredity interpreted as a chemical phenomenon), coloration, and sexual dimorphism. The treatment of color is an effective summary of the arguments of Beddard and others against Poulton's extreme Neo-Darwinian position, and includes a review of some observations of Kay Robinson's, as to the effect of highly colored flowers in warding off herbivorous animals. In a final chapter the various factors of evolution are critically considered. Emphasis is well placed on the importance of climate and parasitic diseases in the struggle for existence; and it is maintained with reason that obvious specific characters may often be correlated with other characters, more obscure, but of higher selective value.

Altogether, this is certainly a fairer statement of the species problem than can be found in many of the books written by biologists of high standing but with a bias toward some special factor in the evolutionary process. For the general reader, however, its lack of proportion and self-assertive style place it far below such a book as Jordan and Kellogg's "Evolution and Animal Life." As reference books, Plate's "Selectionsprinzip" and Kellogg's "Darwinism Today" remain unsurpassed. The professional biologist will receive neither "a rude shock" nor "a fresh impetus" from Messrs. Dewar and Finn; but he will find in their field notes and in their quotations of breeders' gossip an occasional grain of wheat.

Hugo de Vries's "The Mutation Theory" (Volume I) will soon be issued by the American publishers, The Open Court Publishing Company, in a large volume containing twelve full-page color-illustrations, and over one hundred halftones.

"Experiments on the Generation of Insects," translated from Francesco Redi of Arezzo's Italian text of 1688 by Mab Bigelow, is to be issued this autumn by the same house in an illustrated edition limited to one thousand copies.

William Coles-Finch's "Water. Its Origin and Use" (Van Nostrand Co.) is an anachronism. It bears date of 1909, but in style and matter it belongs to the "Wonders of Nature" period, or even to that of the Bridgewater Treatises. The author evidently wrote it to please himself, and it will probably be of use to nobody else. It is a heterogeneous collection of facts and fancies which have caught his attention in the course of years, and which he has duly copied down and put together; statistics, descriptions of scenery, moralizing, historical anecdotes, bits of chemistry and engineering, and quotations from the Bible, the poets, Lord Avebury, and Dean Hole, nearly five hundred pages of the jumble. For his geology he relies mostly on Hugh Miller, Buckland, and Ruskin. He dis-

cusses mineral springs with no reference to hellum, and gives an anaiysis of the air carried out to the second decimal witb no room for argon. He adds, however, a parenthetical note that "according to Rayleigh, air contains one per cent. of argon," apparently implying that this opinion is an idiosyncracy of his lordsbip. In short, the book is commonplace, antiquated, uncritical, and erroneous.

The latest scbool of tbought on the bringing up of cbildren has laid it down as a basic principle tbat infancy sball largely eat wbat it likes and behave as it pleases. Tbe older view which places certain duties of guidance upon parents, is still upheld in Professor Holt's "Tbe Care and Feeding of Children," of wbich tbe fifth edition has just been brought out by D. Appleton & Co. There is quite a list of things that cbildren under tbe age of ten must not do. They should abstain from all ples, tarts, pastry, jam, syrups, preserved fruits, nuts, candy, and dried fruits. The child's reputed "natural" craving for sweets is declared to be an artificially created instinct. Eating between meals is bad; eating hurriedly or witbout desire is bad; cleanliness is always to be striven for; fresh air is to be courted. We have here in condensed and easily accessible form, the main teachings of tbe classical as opposed to the romantic or magazine theory of child hygiene.

The announcement of a book by Prof. William Ostwald always leads to expectation of sometbing new and extraordinary, and the reading of tbe book seldom brings disappointment. His latest work ("Fundamental Principles of Cbemistry," translated by Harry W. Morse; Longmans, Green & Co.) is no exception; in fact, it is one of the most satisfying of all tbe writings of this prolific author in the field of pbysico-chemical science. He here presents the principles of the science broadly and witbout entering in detail into tbe numerous properties of individual substances. He lays emphasis also on an aspect of scientific work too often slurred over, especially by those engaged in original research—tbe orderly arrangement, that is, of facts already known and a clear interpretation of their interrelations. Tbe book is not meant for young students, but every candidate for tbe doctorate would profit by its reading. Every modern teacher will recognize its value and see tbat a copy is in his library.

Dr. John Phillips Reynolds, for twenty years a professor in the Harvard Medical School, and in his time one of the foremost obstetricians of the country, died at his home in Boston on October 10, aged eigbty-three years.

Dr. Herman Endemann, who for many years served as an editor of publications of the American Cbemical Society, died on October 8 at bis home in Brooklyn. He was born in Germany in 1841, held tbe doctorate of the University of Marburg, and was for a time connected witb the Scbool of Mines at Columbia University.

Bryan Cookson, tbe astronomer, has recently died in England, at the age of thirty-six. Since this young English scientist's return from the Cape Observatory, under Sir David Gill, he had erected a zenith telescope at Cambridge for the measurement of variations in the latitude and the constant of aberration, and had joined the observatory staff of Sir Robert Ball.

Drama.

Roses: Four one-act plays by Hermann Sudermann. Translated from the German by Grace Frank. New York. Charles Scribner's Sons. $1.25 net.

The finical detraction, which, of late years, Sudermann has suffered in his own country, makes any foreign tribute to his fame the more welcome. The German critics, who accuse him, not without reason, of an occasional lapse into the theatrical, have been in danger of forgetting the combination of elegance and passion that marks the best prose dialogue of the modern German stage. Because he verges at times on the neurotic, they withhold the praise due to his incisive knowledge of life, both in his own province (East Prussia) and the capital of the empire. To illustrate these qualities of his to an American public, a happier example of his work than "Rosen" might have been selected. A full-sized play, the admirable "Glück im Winckel," or the powerful, if somewhat crass, "Blumenboot," would have served better. If, on the other hand, a group of one-act plays was specifically desired, it is hard to understand the preference given to "Rosen" over the earlier "Morituri," with its perfect little masterpiece—already a classic—of "Fritzchen." But even the four plays in the present volume, highly characteristic of Sudermann's later manner, deserved a more fortunate rendering into English than they have here received.

Miss Frank, it is to be regretted, mistranslates plain words, fails to render the sense of obvious sentences, and blandly leaves out pregnant and characteristic expressions. One may illustrate almost at random. "Of a prosperous lawyer" (p. 47), should be "of a fashionable lawyer" ("eines mondainen Advokaten"); "what a luxury," (p. 52), fails quite to render: "Ist das eine Pracht!" ("what magnificence!" or "splendor"); "you can talk it into yourself" (p. 81), is neither sense nor English for "du kannst dir einreden," ("you can persuade yourself, talk yourself into the notion"). But these are not instances of Miss Frank's most unhappy blunders. The lawyer Ebeling in "Margot" says: "To-day every one is grateful to me, even . . . that poor, unhappy wife" ("ist mir jeder dankbar, selbst . . ."). Miss Frank turns this crucial speech into (p. 64): "To-day some one is grateful to me . . ." and wholly misses the sense. Again, and more flagrantly, Miss Frank writes (p. 122): "I suppose you never were courted by women as he was?" Is not that an incredibly careless rendering of "Hoffendlich haben Sie nie Erfolge bei Frauen gehabt wie er!" ("it is to be hoped that you never had his success with women"). The speech, extremely poignant and tragic, in its place, "as if, unawares, one looked into a blind man's eyes," ("unverwandt einem Blinden in die Augen sieht!") becomes in Miss Frank's version (p. 119), "as if I were looking a blind man in the eyes." The master word of the clause, "unverwandt," is simply left out. Similar examples could be indefinitely multiplied, but it is needless. Miss Frank misses utterly the tone of gorgeous courtesy used by the Prussian officer, and renders the difficult German prepositions with merciless indiscriminateness. Nor is this all. She is determined that Sudermann shall be proper and translates the intense cry of Julia in "Streaks of Light," "nicht Dirne sein müssen, selbst wenn man Dirne ist!" by "I shouldn't have to be a bad woman—even if I am one," which is nonsense. If Sudermann shocks you, it is permissible to leave him alone; it is not permissible to make him talk like a schoolgirl. We have far too few translations of the modern German dramatists, but renderings such as Miss Frank's can serve neither author nor reader.

The New Theatre management announces that so great has been the demand for seats for its subscription performances that an additional series has been arranged for the first-night performances of the twelve plays promised, all the orchestra and balcony seats being offered for subscription. The premières fall on the evenings of November 8, 11, and 17; December 4, 16, and 30; January 12 and 26; February 17, and March 3, 14, and 28.

Paris theatres will offer this season new plays by MM. Brieux and Bernstein (the American rights of M. Bernstein's "Après moi le Déluge" have been secured by Charles Frohman); and M. Bourget is giving the finishing touches to a play for the Vaudeville, "The Barricade." Meantime the season opens with a success for M. Pierre Decourcelle, who, in "Le Roy sans Royaume," at the Porte St. Martin, deals with the legend of the Dauphin's escape from the Temple. Another historical play that has much the same background, the spectacular "Révolution Française" of M. Henri Cain, is staged at the Théâtre Sarah Bernhardt.

Music.

Richard Wagner an seine Künstler. Herausgegeben von Erich Kloss. Berlin: Schuster & Loeffler.

Herbert Spencer pronounced Carlyle's definition of genius as a transcendent capacity of taking trouble "incredibly stupid," pointing out that, quite the contrary, genius is the ability to do with little trouble what ordinary mor-

tals cannot do with any amount of trouble. Yet, without the capacity of taking pains, genius is helpless. Wagner had this capacity, and he had what Edison has called the chief factor of success: "The power of sticking to a thing." For nearly a quarter of a century, he worked on the poems and the scores of his four Nibelung operas, and when at last they were done, he did not take the easy method of placing them in the hands of some royal manager for production, but planned and built a special theatre for them at Bayreuth, and took the additional trouble of personally engaging the artists for the forty-nine parts called for in these four works, as well as the players for an orchestra of unusual dimensions, and of superintending all the details of the rehearsals.

What a Herculean labor he thus laid on his shoulders we realize on reading these letters to his artists and other helpers at the Nibelung festival of 1876, and the "Parsifal" festival of 1882. There are 360 printed in this volume, about one-half of them for the first time, and it must be remembered that this collection is actually the second volume of his "Bayreuther Briefe," the first being devoted to the business letters relating to the festivals. Among the recipients are Hans Richter, Anton Seidl, Hermann Levi, Felix Mottl, August Wilhelmj, Julius Hey, Josef Sucher, Edward Dannreuther, Hans von Wolzogen, Lilli Lehmann, Amalie Materna, Franz Betz, Albert Niemann, Emil Scaria, and many others.

"I am obliged," he wrote to Niemann, "to devote this whole winter (1872) to visiting all the German opera houses, great and small, in order to find out about their singers." When he had found out, and had laid his plans, he invited the chosen ones separately to his home at Bayreuth to get preliminary personal instructions from him regarding their rôles. None could be trusted to find their way unaided in this new art. To the famous Betz, he wrote, in 1874: "I therefore expect you this summer, at your convenience, to come for the first perusal of your part at the piano, to lay the foundation for study." Karl Hill he begged not to look at the music of the parts assigned to him till he came to Bayreuth, "because I prefer that you should make your first acquaintance with them through me, as I consider myself the only one qualified for this." Of his method of imparting to these singers a correct conception of their parts, many interesting illustrations are given (*e. g.*, on pages 37, 56, 68, 157, 168, 201, 329, 332, 340, 360). In the case of the flower girls in "Parsifal," he availed himself of the assistance of Humperdinck, who visited each one separately in the town where she happened to live —for even these chorus girls were carefully selected from various opera companies. Then Lilli Lehmann and Heinrich Porges took charge of them, and Conductor Levi was told that if one of them could not sing the high B flat softly and tenderly, "away with her!" "A single shrill voice would spoil everything," he wrote on this point to Lilli Lehmann.

His missives to Lehmann—"the best of all Lillis," the "dear child and colleague," as he calls her—are perhaps the most interesting in the volume. She was all enthusiasm, and she sang and worked for love of what she knew to be a great cause, asking no compensation. This question of paying the famous singers who coöperated with him was a very serious one to Wagner; money he had little, and he trusted to their willingness to accept little more than sufficed to cover their expenses. Scaria alone made any serious trouble on this score; but subsequently he became the most devoted of friends. Betz was otherwise obstreperous. He vowed, in 1876, he would never sing at Bayreuth again; but Wagner implored him to reconsider this, as on his coöperation and Niemann's would depend the possibility of having another Nibelung festival in a year or two. It was during the preparations for the "Parsifal" performances, however, that the singers caused Wagner the most embarrassment. There were to be three casts, all of famous singers, and it took no end of diplomacy to arrange the question of precedence—who was to appear at the première. This, too, was finally arranged satisfactorily.

As intimated, Wagner was as careful in the choice of players as in that of singers. While visiting all the German opera houses he picked out a good flute-player here, a fine trumpeter there. One tuba player is discarded because his tone on the lowest notes is not strong enough. He has an alto oboe made to order, to be used in place of the English horn; he commends and adopts Ritter's improved viola (p. 174); and he writes to Dannreuther in London asking him to select a special variety of Chinese tamtam for the chimes in "Parsifal." Everywhere and always "a transcendent capacity of taking trouble."

In reading these letters one realizes once more vividly how lucky it was for us that Anton Seidl was the man chosen to make Americans acquainted with the later music-dramas of Wagner. In him the composer had unbounded confidence, as several of the letters in this volume show. "None of the conductors," he wrote to Neumann, "knows my tempi and the suiting of the action to the music. Seidl learned these things from me. He will conduct the Nibelungen better for you than any one else." Not that he considered him without faults; to Dannreuther he wrote: "Keep Seidl at it. He is very reliable, but—at times—careless." In copying manuscripts Seidl was capable of making errors, which Fischer had to correct. In a letter to Mottl, he refers to Seidl's "innate indolence"—a trait which he exchanged on this side of the ocean for true American strenuousness.

It is asserted that the new Milwaukee auditorium, opened on September 21, is "the most perfect and magnificent public hall in the world." The edifice contains, besides the great auditorium, seating ten thousand persons, several smaller halls, one of which is particularly suited for chamber music.

Prior to his appearance with the Philharmonic Orchestra in January, Dr. Wüllner's only recital will be that given at Carnegie Hall on the afternoon of October 16.

Last May ten prizes were offered by the Berlin *Signale* for the best compositions submitted before September 1; and eight hundred and seventy-one manuscripts have been entered in this competition.

Dudley Buck, who died in West Orange, N. J., October 6, at the age of seventy years, was equally famed as organist and as composer of sacred music. He was one of the few native musicians who had no reason to complain that the American composer is overlooked, although some of his most important works, including two operas, a symphony, a concertino, and an overture, have not been printed. His largest published works are two oratorios, "The Golden Legend" and "The Light of Asia." In 1876 he wrote a cantata, "The Centennial Meditation of Columbus." He is at his best in his compositions for male voices. He received his musical education chiefly in Germany, where he spent five of the most impressionable years of his youth at the Leipzig Conservatory and at Dresden.

Art.

The same revelation is made in Dr. Edwin Atlee Barber's "Maiolica of Mexico" (one of the art handbooks published by the Pennsylvania Museum and School of Industrial Art) as in several recent monographs on Spanish colonial architecture. The vigorous creativeness of Spanish-American craftsmen contrasts with the meagreness of English colonial arts and crafts. The reader of this book discovers that a beautiful fictile art, based originally upon the practices of the makers of Spanish faience and influenced later by importations of Chinese and Japanese wares, flourished in Mexico for about three centuries. Though it became decadent in the nineteenth century, it is by no means dead. Much stanniferous pottery, some of it of good quality, is still made at Puebla, the centre of the industry from the beginning. That so little has been known about this art is surprising. Enamelled tiles were employed in the adornment of many of the cathedrals familiar to tourists. Pottery has been exported in considerable quantities. Yet, until Dr. Barber's researches proved the contrary, the assertion was frequently made that the enamelled pottery had never been produced in the western hemisphere. It has, however, been made in Mexico, and search among manuscript rec-

ords has revealed the conditions under which the industry was carried on at various periods, and has made it possible to classify styles and marks.

"Corot and his Friends," by Everard Meynell (A. Wessels Co.), is in its way a remarkable piece of book-making; few have succeeded in producing so large a volume with so very little in it. It is agreeably enough written, in a fluttering, touch and go, allusive manner, but all it really tells us about Corot might be put in two of its three hundred octavo pages. It is true there is a certain amount of rambling information about other people whose connection with the master, when it exists at all, is often of the slightest, but not all of this is accurate. It is somewhat startling to be told that Diaz, who is said to have lost his leg at fifteen from the bite of a viper, "ended his fit of existence" from the same cause in 1876. Two vipers in one life is too many. The only things in the book one is glad to have are the illustrations, though one hardly sees what the copies of two lithographs, one by Gavarni and the other by Daumier, have to do there. The reproductions of Corot's own works will be a revelation of his variety to many who think of him as the painter of one endlessly repeated picture, and the very fault of the reproductions, which are too black-and-white, tends to accent the solid skeleton of structure and of light and shade that underlies his vaporousness.

"Le Musée du Louvre" (H. Laurens) forms a series of five volumes by the curators. The present number, by Jean Guiffrey, describes the paintings, drawings, and engravings, with 105 illustrations. The four other volumes deal, or are to deal, with the Louvre palace; Egyptian and Oriental antiquities; Greek and Roman ditto; and sculpture and art objects of the Middle Ages, Renaissance, and modern times. With inevitable *lacunæ* and defects of organization, the Louvre still constitutes the art collection of widest sweep ever brought together. All these volumes belong to the general series of Les Grandes Institutions de France.

Charles-Antoine Fournier, "Jean Dolent," has died at Paris, the place of his birth in 1835. Known outside his own country as a collector and a writer on art, "Jean Dolent" was at various times an editor or contributor of the *Gaulois*, the *Revue contemporaine*, and the *Temps*. His "Petit manuel d'Art" appeared in 1873; he wrote, as well, "Le Livre d'art des femmes," "Amoureux d'art," "Nouvelles á l'eau-forte," and a number of romances.

The French caricaturist, Lemot, a pupil of André Gill, died last month at Asnières, near Paris. In recent years he contributed his best work to *La Croix*.

Finance.

THE TIGHTENING OF MONEY.

The somewhat unexpected advance in the Bank of England's official discount rate, last Thursday—the first advance since 1907—came with a rise in the Imperial German Bank's official rate from 3½ to 4 per cent., and was followed, on Monday, by a further advance at the German bank to 5 per cent. In the week before the London bank rate rose, surplus reserves of the New York Associated Banks were reported at $1,600,000, the lowest figure reached at the opening of October in exactly twenty years. Two days before the advance at the Bank of England, rates for demand loans on the Wall Street market went to 6 per cent., the highest rate touched since full payments to depositors were resumed at the banks in January, 1908.

All this sufficiently establishes the fact, which had heretofore been disputed in many quarters, that the tightening of money is a world-wide symptom. The new rates fixed in this series of advances are not high, if contrasted with the figures attained in such autumn seasons as those of 1906 and 1907. To-day's 3 per cent. rate at the Bank of England compares with 6 per cent. in 1906 and 7 in 1907; the Bank of Germany's present 5 per cent. rate compares with rates of 6 and 7½, respectively, in the two other years; and Wall Street paid on occasion 40 to 125 per cent. for its call loans in the same periods. But the importance of the movement lies in its indication of existing tendencies.

For this general tightening of money there are three causes. One of them is the recovery in trade, especially in the iron industry, from its after-panic prostration. Another is the immense amount of new securities, floated on nearly all the world's great markets during the twelvemonth past, with a view to taking advantage of an easy money market. The third, and at present the most potent cause, is the outburst of speculation for the rise in stocks, notably on the Berlin and New York markets.

The situation has, however, some aspects out of the ordinary. For nearly six months past, a speculation of unusual magnitude has been in progress on the German and American markets. At New York these operations for the rise, under the auspices of the most powerful banking interests in the country, have gone to great extremes. The market value of Steel shares in particular has been enhanced, during that period, $280,000,000, and, since the operation was conducted on the basis of loans raised on collateral of these very Steel shares, the capital tied up was of portentous magnitude. A similar process has, moreover, been at work in half a dozen other stocks. Conservative critics warned the powerful speculators, months ago, that to press this advance in the face of the harvest needs for money, and through use of the very reserve money which interior banks would presently require to move the crops, was to incur great risk; but the speculators treated the warnings with contempt. "Steel" touched its highest price a day after the bank statement showed a nearly exhausted New York surplus.

To help out their position, these easy-going financiers arranged for extensive shifting of loans and liabilities from the New York banks to inland institutions. When this expedient began to fail, as the call for harvest funds taxed the resources of the inland banks, the "shifting process" was diverted to the New York trust companies. But those companies, under the new law of 1908, are now required to keep a definite ratio of reserves to liabilities, and their assumption of bank loans, two weeks ago, nearly exhausted their own surplus. To save the speculation from collapse, therefore, recourse was had last week to the London market, and last Saturday's statement showed the astonishing decrease, in the loan account of the New York Associated Banks, of $49,400,000—the largest weekly decrease, by nearly $20,000,000, in the history of New York banking. It was perfectly understood, at London and on Wall Street, that this extraordinary contraction was effected, not by reducing credits granted to the Stock Exchange, but by wholesale transfer of Wall Street loans to London banks.

When the German bank rate advanced last month, the president of the bank publicly stated that the marking-up of money was intended to curb the excesses of stock speculation at Berlin. The rise in the Bank of England rate was as clearly recognized as a warning to speculative Wall Street. It now remains to be seen what the sequel on the speculative markets is to be. In 1905, when the Bank of England rate went up from 2½ to 3 per cent. on September 7, and to 4 on September 13, the London *Economist* remarked:

> The whole question hinges on the New York demand. The cardinal point is, that the withdrawals on American account are made for the support of Wall Street operations, and are not governed by ordinary exchange conditions. . . . The [New York] banks have piled up their loans to an unprecedented amount, and allowed their cash reserves to run so low that they are ill-prepared to meet the demand upon them for harvest purposes. They could, of course, strengthen themselves by calling in loans; but, as that would cause trouble in Wall Street, the financial magnates by whom the banks are largely controlled will seek rather to draw money from this side to replenish the depleted reserves.

Again, when the English bank rate, on October 11 and 19, 1906, rose from 4 to 5 per cent., and then to 6, the same financial authority thus described the situation:

> The gold drain which has led to the present situation has been largely due to the extent to which Lombard Street had financed commercial and speculative activity in the United States. . . . It would be well if those who have been lending so freely on American collateral would now curtail the facilities they are offering, and, if the

banks were to refrain, as far as poss bl from renewing American finance bills.

In a reminiscent way, it may be asked what followed. In 1905, the Bank of England's action did not obstruct the programme of the Wall Street pool, though it helped to cause the 12% per cent. call money market of December. In 1906, when 4 per cent., the high rate of the year before, proved equally futile in stopping Wall Street's extravagances in the European credit market, the bank raised its rate to 5 and then to 6, threatening 7 if the use of English money for the purpose was continued. It did not continue; the speculation broke down.

Notes on a Few of Henry Holt and Company's New Books

PUBLISHED AT 34 WEST 33RD ST.

Wm. De Morgan's It Never Can Happen Again will appear Nov. 16th. ($1.75.)

Letters from G. G. excited wide and enthusiastic approval as they appeared this year in the *American Magazine*. They tell the story of a refined, discerning young woman, forced to earn her living by brush and pen. Underneath their surface sparkle lies deep feeling and kindly philosophy. The constantly shifting scenes include Paris, Florence, New York, Cape Cod, and Florida. (223 pp. 16mo. $1.00 net. By mail, $1.06.)

Wilson Vance's Big John Baldwin is a notable romance of a big-hearted, big-bodied, unconsciously humorous Cromwellian soldier in England and Virginia. $1.50; just published.

Mrs. R. S. Garnett's The Infamous John Friend is receiving remarkable notices for a first novel. *The Bookman* says: "It has many fine qualities . . . vivid and full of the stir of life." The London *Spectator* finds it "extremely powerful and interesting." The New York *Sun:* "Exceedingly vivid and interesting." It tells a dramatic episode of Napoleon's projected invasion of England. $1.50.

John Davis's Travels of Four Years and a Half in the United States of America (1798-1802). Trevelyan says of this book in his "American Revolution": "Among accounts of such voyages none are more life-like; an exquisitely absurd book." With introduction and notes by *Alfred R. Morrison.* $2.50 net; by mail, $2.65.

Dr. Richard Burton's Masters of the English Novel. This new book by the author of "Literary Likings" covers Fiction and the Novel: Richardson, Fielding, Smollett, Sterne and Others. Realism: Jane Austen. Modern Romanticism: Scott. French Influence: Dickens, Thackeray, George Eliot, Trollope and Others, Hardy and Meredith, Stevenson—The American Contribution, etc. $1.25 net.

Prof. R. M. Johnston's The French Revolution: A Short History is called by the *Churchman* "an almost ideal book of its kind and within its scope." ($1.25 net; by mail, $1.37.)

***By the same author: Napoleon: A Short Biography. $1.25 net.—Leading American Soldiers. $1.75 net; by mail, $1.92.

Charles Frederick Carter's When the Railroads Were New The *Tribune* says: "With many of the qualities of a work of reference, the book is as readable as a novel." 16 full-page illustrations. $2 net; by mail, $2.16.

Logan G. McPherson's Railroad Freight Rates in Relation to the Industry and Commerce of the United States is truly called by the *Sun* "a book the Nation has needed." 3rd printing. $2.25 net; by mail, $2.42.

The book for the Opera Season is **Krehbiel's Chapters of Opera,** richly illustrated; $3.50 net; by mail, $3.72. Illustrated circular on application.

NOW READY

The Meaning of Truth

A Sequel to Pragmatism. By Professor WILLIAM JAMES, author of "The Varieties of Religious Experience," &c. 8vo. $1.25 *net.* By mail, $1.38.

NEW YORK, THURSDAY, OCTOBER 21, 1909.

The Week.

The meeting of the President of the United States and the President of Mexico signifies more than a formal act of international courtesy. It typifies not only good feeling between the two countries, but the kind of relation that ought to exist between the great republic of the North and all the republics to the South of her. It is now sixty years since what the monument at Chapultepec calls "the North American invasion" dismembered Mexico, and it has taken all that time, with correct conduct on our part, to free the minds of Mexicans from the fear of further aggression. Today, happily, no intelligent man south of the Rio Grande believes that the United States cherishes any territorial ambitions at the expense of her neighbor. There is, indeed, an American conquest of Mexico going on, but it is peaceful. American capital has gone into Mexican railways and mines and manufactures, and more of it will go; but there is no thought of seizing the land or impairing Mexican sovereignty. What we see is simply friendly cooperation in developing the resources and advancing the civilization of an adjoining country. American enterprise and American ideas have gone where no one now thinks of making the flag go. This fortunate state of things has been publicly symbolized in the greetings of Diaz and Taft.

The tradition of democratic simplicity has not been entirely submerged in the national flood of monkey-dinners and imported sons-in-law. Unostentatiousness lingers where it best belongs, about the office of the President of the United States. When the President of Mexico crossed the international bridge over the Rio Grande, his wheel hubs and harness were of gold and his martial chest was refulgent with precious stones. When Mr. Taft crossed the Rio Grande, he rode in an ordinary specimen of what the West is fond of describing as a low-necked carriage, probably hired for the occasion. The Kansas farmer has his motor car and the Colorado miner sends his daughter to Vassar and Paris, but when the President of the United States is caught in the rain, he must go to bed while his clothes are being pressed. We must not be misled by the fact that the President's journey has traced a furrow of silk hats and frock coats across the primitive soil of Utah, Arizona, and New Mexico. The tall hat and the Prince Albert have been thoroughly democratized ever since it grew possible to get them from a mail-order house on the basis of one's own measurements. When the Germans call us a nation of materialists, they only exhibit their laughable ignorance of a people whose chief magistrate's trousers bag at the knee.

President Taft's advocacy of ship subsidies does not meeet with approval in the editorial columns of the central Republican organ of his own State, the *Ohio State Journal*. It is flatly opposed to subsidies as such, and not willing to accept them under some euphemistic disguise. "We are not concerned with exact definitions," it says. "When the government pays $500,000 for what costs $100,000, it makes no difference what you call the $400,000. It is a burden on the people by whatever name it is known." With a continually increasing display of independence among the Republicans of the Middle West, it is not impossible that the subsidy-hunters will find that they have already passed the zenith of their influence. It is hard to make out a reasonable argument for any gain by subsidy to any one except those directly interested, and it will certainly prove doubly hard with the hundreds of thousands of Republican farmers north of Mason and Dixon's line and between the Alleghanies and the Rockies. In that stretch of territory, the whole scheme can be nullified if sentiment already existing is kept alive and properly directed.

Signs of new life in the Democratic party were never so welcome as to-day. On Saturday, Gov. Judson Harmon of Ohio delivered a speech at Dallas, Texas, which is announced as the first gun in his campaign for the Presidency. Certainly, if any man in the party has such an ambition, he can do no better service than to let it be known. Since the death of Gov. Johnson, Gov. Harmon is the most influential Democrat in public life. His Administration in Ohio is apparently commending itself to Democrats and Republicans alike. His speech of Saturday was a reaffirmation of the sound policies which led to his party's two victories. He was radical enough, when Mr. Cleveland's Attorney-General, to carry forward to success the first important cases under the Interstate Commerce law, yet he has held fast to those fundamental Democratic principles, which are never outworn. Congressman Clark's avowal of the candidacy for the Speakership was to be expected. He is by no means romancing when he says that President Taft's tariff speeches are helping the Democrats. Certainly, there is every evidence that they have not sweetened the new tariff to the taste of thousands of disgruntled Republicans. The opportunity to win the next House lies plainly before the Democrats. It is for the new leaders to say whether it shall be seized.

We can remember no effort to hunt down criminals in high place more entitled to public interest and encouragement than that which the Federal government is now making to fasten the guilt of the Sugar Trust frauds upon the big men who were responsible for them. That persons high in the management of the American Sugar Refining Company not only knew of, but instigated and directed, these contemptible and systematic thefts, carried on day after day for years, is self-evident. The swindling was solely in the interest of the company; and it only remains now to procure legal evidence sufficient to convict some or all of the responsible criminals. One aspect of the crime which brands it with peculiar infamy is the color it gives to the widespread idea that the existing organization of society is too rotten to tolerate. If such callous disregard of all moral restraint, such shameless and sordid greed, were really representative of business standards, it would be about time for the whole thing to be cleared away. Nothing of the kind is true; but as it is not, there should be a united and determined demand that these high-placed

criminals be relentlessly hunted down and punished. Upon no work will the Federal Department of Justice do better to concentrate its energies.

The immediate investigation by the Public Service Commission of Sunday's accident on the New York Central Railroad is a vivid reminder of the kind of benefit resulting from the existence of such a commission. It is true that in recent years this particular company has shown a willingness to make public promptly the facts it has ascertained about any accident; but that disposition is not universal, and it is only a few years since the opposite attitude was regularly assumed by virtually all railway companies; they told as much or as little as they pleased, and when they pleased. Moreover, it is one thing for the company to furnish information, and quite another for public officers to make searching investigation and a disinterested report. But it is not only the matter of accidents that we have in mind in this connection; it is the whole operation of the railroads and of the street railways as affecting the public comfort, health, and safety. The power has always existed in legislatures to exact proper arrangements for the securing of these in all practicable ways, but there was no way to put that power into effective exercise until permanent special commissions were instituted and clothed with adequate authority.

In the *Outlook*, George Kennan, himself an experienced Siberian sledger, submits Dr. Cook's statements about his food supply to another searching analysis, with a resultant decision that "the story of the alleged achievement, therefore, must be dismissed as in the highest degree improbable, if not absolutely incredible and impossible." With this opinion most unbiassed people now, we think, agree. By that we do not mean to say that Mr. Kennan's demonstration is to be taken as the final disposition of Dr. Cook's claims. But it deals with a most important question, which, with many people, will carry much more weight than Peary's report of the testimony he got from Dr. Cook's Eskimos. When the time does come for an impartial scientific body to pass upon Dr. Cook's claims, Mr. Kennan's article is bound to be the basis of much cross-questioning of Dr. Cook. Mr. Kennan deals only with Dr. Cook's own statements as to the amount of food taken on the final dash—800 pounds of pemmican—and shows by simple arithmetic that three men and dogs which decreased in number from twenty-six to ten could not have been sustained on this food supply for the eighty days of the dash to the Pole and the return. It would suffice only for forty-two days, if men and dogs were allowed a pound a day. But even by reducing that ration and allowing for the consumption of some dog flesh, it is impossible to make the 800 pounds cover the eighty days during which, according to Cook's own statement, he killed no game.

If we could have a dozen new college presidents put into office in as many weeks, the fight for higher intellectual standards would receive an impulse that might insure victory from the start. Dartmouth's new president agrees with Harvard's new president on the need of fostering scholarship in college. His remedy has the advantage over Dr. Lowell's of greater concreteness. Give us more money, says President Nichols, that we may have more instructors, that we may have smaller classes, that each student may come into contact with a man who is learned and loves learning, and may catch something of the divine flame. Why should not leadership count in the field of scholarship as in every other sphere of life? As a rule, we become fervent believers in Martian canals, Browning, woman-suffrage free-trade, Peary or Cook, when we listen to some one who fervently believes in those things. Small classes will not do everything. They will not at once take freshmen who spell "earegular" and "aprentise" and turn them into lovers of Walter Pater and Horace. Compared with the European student, our sophomores must be half-baked, just as our millionaires and our theatres are half-baked. But if the small class shall teach nothing else but the futility of our worship of mere size, it will have done good service.

While the House of Commons was taking a recess, the Lords remained in session, and voted unanimously the second reading of Lloyd-George's development and roads improvement bill. This is taken as a sign that the Lords are making up their minds not to throw out the budget, since the money to carry out the projects of the development bill is provided in the budget. The particular inference may be fallacious, but it falls in with many other indications that the Lords feel their courage oozing out of them. One little token of this is a cartoon in the last number of *Punch*, which is certainly not a Liberal paper. It pictures a ferocious bull, labelled "People's Budget," coming down the road, and in front of it a coronetted spaniel which is saying: "They tell me that as a sportsman I ought to take this thing; but I'm not at all sure I shan't let it pass." The real reason for the hesitation of the Lords is, of course, not a scruple about their constitutional privilege, nor reluctance to precipitate the kind of financial chaos which would follow the rejection of the budget, but fear of what would happen to them if they forced a general election and got beaten. Agents of both parties have been scouring the country to ascertain popular sentiment, and it is understood that the Unionist inquirers have refused to guarantee Mr. Balfour a majority if he should go to the country on the issue of the Lords against the Commons. A "Unionist Peer" writes to the *Westminster Gazette* to point out that his party would have to carry 320 out of the 465 seats in England alone (they now have but 128), in order to secure a working majority, and records his protest "against the Unionist party playing for stakes it cannot afford to lose." In keeping with this is the telegram which the former Speaker, Viscount Peel, sent to the *Daily Chronicle:* "Hope Lords will pause before extreme step of rejecting Finance Bill."

Even in retirement, Prince Bülow cannot keep out of controversy. In the newspaper discussion of his fall and its causes, the assertion was widely made that the slackening of the Kaiser's confidence and the withdrawal of the Kaiser's active support led to the Chancellor's overthrow in the Reichstag. Then came a denial from Von Bülow himself, who gave a brief statement to a news agency saying that the political parties which were responsible for his leaving office could not "be allowed to shift the *odium* from themselves to the Crown." Thereupon the leading Conservative organ, the *Kreuz Zeitung*,

made the following significant comment:

> We have every reason to suppose that up to the time of his departure Prince Bülow believed himself to be assured of the complete restoration of the Imperial confidence, which had been temporarily shaken. But we have equally good reasons to suppose that in this belief Prince Bülow was mistaken.

Behind all these charges and insinuations there lies the really important question whether Germany is approaching anything like Parliamentary government, under which the Reichstag can practically dismiss a Minister. It appears that the German Conservatives and Centrists, who at first gloried over Prince Bülow's fall, are now a little frightened at their own success, and are willing to have it understood that it was the Emperor who did it, after all.

Airship crazy as they are, Germans have been deeply interested in what appears to have been the first dirigible race. It was between the Zeppelin III and the Parseval III, the latter being the latest army dirigible built by Major von Parseval, Zeppelin's greatest rival, and the course was from Frankfort to Darmstadt. The Parseval III won easily, although 300 feet higher than the Zeppelin III and using only half her power. It is only fair to say, however, that the Parseval III is built to stay aloft for only twenty hours, and so carries less fuel, and that its motors are much more powerful. This is due to the fact that the Zeppelin, being a rigid dirigible, sacrifices 40 per cent. of its lifting power to the structural weight, while the Parseval III, being of the non-rigid type, loses only 25 per cent. of its lifting power on account of its own weight, exclusive of supplies, passengers, and engines. The Zeppelinites have taken the defeat of their craft with such bad grace that Major von Parseval is eager to give them another sail for their satisfaction, if not for their money. Meanwhile, however, the Zeppelin III has again delighted its admirers by a twelve-hour flight from Frankfort to Düsseldorf by way of St. Goar, Coblentz, and Cologne. The airship made its way against a heavy west wind and a pouring rain. yet at all times was easily manœuvred.

It is somewhat surprising to learn that a movement is on foot in Berlin to place the tipping system in restaurants upon a systematic basis and to establish the practice as a matter of compulsion and not of choice. The amount of the tip is generally already regarded there as so nearly a matter of precise calculation, as well as of understood necessity, that one would think nothing more in this direction was called for. What makes the tipping system in our own country, and especially in New York, so great a nuisance is the wild vagaries to which it is subject, owing to the extravagant habits of people whose one idea about money is to show that they don't care how loosely they fling it around. This brings about a state of things in which sensible men, while giving more than they think reasonable, often have not even the comfort of being sure that they have come up to the mark. It would certainly be an improvement to have a generally accepted scale, which it would be "bad form" to exceed as well as to fall short of. But far from our entering upon any limitation of the tipping system, it is invading territory which, until recently, had been exempt from its operation. When it comes to levying toll at a public dinner, the line ought to be drawn; and yet that is a practice which is apparently on the way to getting established. It is to be hoped that somebody will have the courage to start a tipless restaurant—provided he understands his business, and also takes care to pay the waiters wages high enough to make their places desirable. If this be done, they will be quite as pleasant and as attentive as they are now with their mind's eye on the doubtful tip.

Paris and Rome, where the most violent of the Ferrer demonstrations have taken place, are the strongest centres of European anti-clericalism. In Italy the campaign against the Church schools has taken on importance during the last few years. The impulse came from France; the movement gained rapid headway after Rome elected a Free-Mason Mayor and a Radical Municipal Council. The secularization of the schools was brought up in the Italian Parliament last year. It had a spectacular advocate in the person of Don Romolo Murri, a former priest, who has given up the old faith but clings to his clerical vestments. It failed because public opinion in Italy is evidently not prepared for a complete break with the Church. In France, on the other hand, the anti-clerical campaign has been carried from Parliament into the schools. In a recent pastoral letter signed by the French cardinals, archbishops, and bishops, the faithful are warned against sending their children to the so-called neutral schools, whose neutrality takes the form of bitter opposition to church and religion. The Catholic schools must be kept up if the Catholic churches are to be kept up. "In proportion as the schools from which religious instruction is banished keep on filling up our churches will grow empty." The pastoral letter puts the ban on more than a dozen text-books in French history and civics whose views it finds pernicious. "If, therefore," the letter concludes, "parents perceive that the souls of their children are imperilled in the so-called neutral schools, they must not hesitate, under pain of forfeiting the sacraments of the church." French radicalism interprets the last sentence as a call to sedition.

The tone of the American press is decidedly favorable to Gen. Estrada, who is now pursuing the regular path of Presidential ambition in Nicaragua. And it makes no bones about saying why we are for Estrada and against Zelaya. Estrada will reduce import and export duties, Estrada will throw open government concessions to foreign capital, Estrada is for us, and, consequently, we are heartily for him. Our State Department has been scrupulously correct. The revolutionary leader's communications have remained unanswered because he is still a revolutionist, but we are told that it is practically certain that the Estrada government will be recognized as soon as decency permits. For "President Zelaya for a long time has been a thorn in the side of American diplomacy seeking to bring order out of the chaos in Central America." So here again we are for Estrada because he is for us, a justifiable policy if playing with revolutions were not a dangerous thing. Surely, the chaos in Central America will not come nearer to cosmos by our helping on the methods that make it. Six years ago, when this country and the moulder of its destinies wanted something very badly down in Spanish America, we made use of a revolution to get it. But that fine act of highway robbery at least carried no moral pretensions.

"RED-HOT" DIPLOMACY.

The abrupt termination of Mr. Charles R. Crane's career as Minister to China causes both surprise and regret. His appointment was looked upon as peculiarly fortunate. President Taft publicly expressed his pleasure at having found a man so well fitted for the important post. Successful in business, having a wide acquaintance with affairs in the Far East, independent in politics, Mr. Crane seemed to have a future of usefulness and distinction before him in the diplomatic service. But now for a single indiscretion his resignation has been demanded even before he set sail for China.

Mr. Crane's indiscretion is not denied by him, and we think its gravity is beyond doubt. He talked too freely with a newspaper reporter about State Department secrets, in connection with our relations to Japan and China. The Minister's name was not used in the publication of this gossip by a Chicago paper, but his inspiration of it was apparent at least to the officials of the State Department. Now, it must be admitted that the offence was serious. The standing instructions of the diplomatic officers of the United States forbid them, in general, to "correspond with newspapers." All the greater is the impropriety of conversing with reporters for the press upon important international questions still pending. Mr. Crane was gravely at fault, and his dismissal is technically justifiable. That can be conceded, however, without assenting to either the tact or the wisdom of the whole proceeding. There was unnecessary roughness about it; and if the Secretary of State has read a severe lesson in discretion, he has done it at the cost of exciting a certain public apprehension regarding our interests in the Orient. The offending publication had no wide circulation and had done no great harm. A private reprimand and warning to Mr. Crane might have been deemed punishment enough; or, he might have been allowed quietly to resign after an interval. To recall him imperatively from San Francisco and to dismiss him out of hand, seems too much like applying *peine forte et dure* to a minor crime. It may add to the reputation of our diplomacy for force, but not for suavity or dignity.

In Mr. Crane's statement, put forth in extenuation of his admitted indiscretion, he points out certain difficulties under which he had labored. He had never had a consultation with Secretary Knox, who was away from Washington when the new Minister to China went there for instructions. Not even with the first Assistant Secretary, Mr. Wilson, did Mr. Crane have a conference, though he sought repeatedly to arrange one. His sole interviews were with clerks in the Department. Such general instructions as he had came from President Taft, who urged him to do everything he could to interest Americans in the questions of the Pacific, and especially to accept all invitations to speak, and to "let them have it red hot." This, of course, was no warrant for speaking indiscreetly, much less for giving delicate information to a reporter, but it does betray the state of mind into which Mr. Crane had got under the highest prompting. And it illustrates the perils as well as the advantages of the "new diplomacy," which sometimes appears to be like the heathen of old in thinking that it "shall be heard for its much speaking." Especially is red-hot speaking by a diplomat apt to result in the burning of his own fingers.

A new tendency has plainly been setting in, and America has largely been responsible for it. If the practice is inclining to the selection of diplomats who can speak acceptably on public occasions, the number of examples that the United States has furnished must have had a good deal to do with it. Our succession of Ministers to England, from Lowell to Choate, able to lend a grace to literary anniversaries or civic festivals, created a sort of standard in the representation of one people to another, instead of merely one government to another. From that has seemed to follow the choice of Ambassadors to the United States—German, French, Brazilian, as well as British—who make themselves familiar figures in various parts of the country. More than fifty years ago, John Delane wrote to Lord Clarendon urging the selection of a British Minister at Washington who could make good speeches. Mr. Bryce would have satisfied him!

Our new school of speaking diplomats, however, should never forget that their oratory must always be seasoned with discretion. The highest praise that can be given to an address by an Ambassador is that it never once trenched on the proprieties, betrayed no official confidence, did not dim by so much as a breath the good relations between his own country and that where he was speaking. But such successes do not go with the "red-hot" method. This, on the contrary, is almost certain to lead to "blazing indiscretions," of the kind to which Lord Salisbury used to be so prone, but which it is certain that he, as Foreign Secretary, would never have tolerated in a subordinate.

SPAIN'S NEW TROUBLES.

Nothing could have been more unlucky for the Spanish government, just now, than such an alienation of foreign sympathy as has been caused by the execution of Professor Ferrer. It would be absurd to speak as if we had here the makings of another Dreyfus case, but that the affair is a serious and bad thing for Spain cannot well be denied. For one thing it prejudices her newly won place in the councils of Europe. Spain's importance in European politics has singularly increased since her catastrophes in the war with the United States. Diplomatically, she made a rapid rebound. The weight, or at least the strategic significance, which she has for the past six or seven years enjoyed in the chancelleries of Europe, is doubtless greater than she had known since 1870 and the resounding controversy over the possible accession of a German prince to the throne of Isabella. The English alliance, sealed by the marriage of Alfonso and Victoria; the close and good relations with France; even the long friction with Germany over Moroccan questions; the Algeciras Conference, resulting in Spain's becoming a mandatory of the Powers—all this indicates the international prominence which Spain had been slowly reconquering, or which had come to her in consequence of her position on the European chess-board. It is nothing less than a diplomatic blunder of the first magnitude, therefore, for her government to have taken a step which has inflamed against her the humane sentiment of France and Italy and England.

The suggestion that the events of last July were a blessing in disguise for Barcelona and for Spain generally, sounds almost too paradoxical. It is, however, the sober opinion of a contributor to the *Contemporary Review*. Writ-

ing in that periodical, Herbert Adams Gibbons defends the thesis that, notwithstanding the strong Catalan inclination to Republicanism, a desire on the part of these "Yankees of Spain" for industrial and commercial prosperity is an influence always powerful enough to prevent a political propaganda by an appeal to arms. "Separatism," he writes, "never more than an impractical dream, has disappeared for the present"; Carlism he qualifies as "a lost cause." The conflict of the future is to be a battle of the ballots, with Monarchism and Republicanism the rallying-points. Now is the time, cries Mr. Gibbons, "for the king and his Cabinet, and for the municipal authorities of Barcelona, to profit by the present frame of the public mind, and take measures which will insure the unbroken peace and prosperity of their nation and its Queen City."

There is in this at least the undoubted truth that Spain's great task is that of social and political reorganization. And it is a fact that many of her best minds have been giving of their energy to that labor. More than one acute observer has noted a kind of "intensive cultivation" in Spain since the loss of the last of her colonies. From grandiose but fruitless projects across the seas, the Spanish nation has turned its attention to the work to be done at home. Nor has a fair degree of progress been wanting. In the development of her mines and fields, the improvement and extension of her manufactures, and the solidifying of her finances, Spain has many advances to point to within the past decade. In all these matters, the experience of other countries has been carefully studied, nor have political conditions in other lands been neglected by Spanish students, reformers, and statesmen. Prof. Martin Hume of Cambridge University, a high authority on Spanish affairs, himself a member of the Royal Spanish Academy, recently wrote of the leading Spaniards of the present day:

> The result of their war with the United States has brought home to them incontestably that in order to vie with the enlightened nations, whose qualities they admire and whose prosperity they envy, their own domestic organization must be reformed. The mass of the people have long been convinced that the remedy they seek will not be found in mere political changes or by varying the nominal form of government; and on all hands it is acknowledged that the malady of the country, being to a great extent one of character, must be diagnosed by a close study of their social life and habits. This conviction has turned the best intellects of Spain in the last ten years almost exclusively to the analysis of social conditions at home and abroad, and more especially of those of the peoples of Anglo-Saxon origin whose institutions are most advanced.

In the light of such a promising movement in Spain, we can the more readily see how unhappy the effect must be of putting to death an intellectual leader like Professor Ferrer in a way to leave a cloud on the justice of his execution. We cannot, of course, pretend to judge the force of the evidence against him, but we know that before a civil tribunal he was acquitted, that it was a secret military trial in which he was condemned; and the outside world cannot be blamed if it believes that a judicial murder was committed. The motives to it were plain. Revolutionists were to be stricken with terror, while the dread and absolutist power of the government was to be exalted. But this is only to take counsel of frightened and stupid reactionaries. The King and his advisers must misread the history of their own country, to say nothing of others, if they imagine that a policy of blood and iron can win against indestructible human aspirations.

It is not, perhaps, strange that both the throne and the church in Spain should have been startled by the evidences of fierce animosity against them, during the terrible scenes in Barcelona and elsewhere. An affable and democratic monarch found himself the object of fury, and a Church which had been supreme in the religious life of the people ever since the expulsion of the Moors, discovered that thousands of Spaniards were only waiting to visit their ferocity upon it. An extreme reaction was natural, but the question is whether it is wise to persist in it. Temporarily, the army may be placed on a pinnacle and ecclesiastics made to appear all-powerful; but no one who knows the Spanish temper, or even understands anything of human nature, can imagine that the method of ruthless repression can long succeed. It is not a question of dealing merely with anarchists; though Professor Ferrer's blood will be their seed. What Spain needs to-day is a large and conciliatory and constructive policy.

WHERE DOCTOR COOK NOW STANDS

Let it be admitted at once that the affidavit of Barrill, the man who accompanied Doctor Cook on his alleged ascent of Mount McKinley, is not conclusive evidence of the falsity of the doctor's story; for, certainly, a man who signs a sworn statement that he had been a voluntary participant in the concoction of an elaborate and swindling falsehood cannot be accepted as an unimpeachable witness when he swears that he lied. However fully this may be granted, it is nevertheless manifest that the publication of Barrill's affidavit, to say nothing of other evidence, radically alters the position in which Cook stands as regards his claim to the discovery of the North Pole. That position should be set down in as plain language as possible, and this we shall attempt to do.

Seven weeks have passed since his first story of his exploit was given to the world. Since that time, he has added virtually nothing to the meagre evidence furnished in his account of the tremendous task which he claims to have accomplished, with the assistance of only two young Eskimos, after the most arduous and long-planned endeavors of all his predecessors had failed. These two Eskimos, the only companions of his journey, have given a circumstantial story of that journey according to which it was not even an attempt to reach the Pole, but a deliberate imposture—a mere dash a short way out over the land ice, followed by a long sojourn hundreds of miles south of the Pole. And now comes his only companion on the other extraordinary adventure that he claims to have carried to a triumphant conclusion, and swears that this, too, was a deliberate imposture. Thus two tremendous feats of endurance, skill, and daring—two achievements each of which had been given up in despair by all who had gone before him—are claimed by Doctor Cook, not only on the mere basis of his unsupported word, but in the face of positive and circumstantial statements to the contrary made by every human being who was with him on either occasion.

Such a situation would obviously provoke, on the part of any man who wished to retain the respect of his fellows, a demand for the promptest, most com-

prehensive, and most thorough investigation possible. The *Nation* has not permitted itself to pass judgment on his case on the basis of a mere balance of probabilities, however strongly it may have felt, at times, that that balance inclined in one direction. But the time has come, or will come very soon, when mere failure to press the question to a conclusion must be regarded as a confession of guilt. It is not for this or that scientific body, or this or that newspaper, to suggest to Doctor Cook the propriety of presenting his evidence and getting an authoritative verdict; it is for him to *demand* an inquiry, to insist on its being complete, to place not only his memoranda, but himself, unreservedly at the disposal of an impartial committee of investigation. Failure to do this, and to do it promptly, will, we warn him, very rapidly have the effect of causing those whose opinions are worth anything to set him down as a shameless impostor.

This is strong language, but it has been carefully weighed. We have not been anxious to have Cook's claim disproved; we have held out for fair play. But as time has passed, the spectacle presented by this unproved claimant to signal honors has become more and more offensive. He has been complacently going about the country taking in the people's money and enjoying the people's plaudits and leaving to the future the task of establishing his claim. To criticisms based on intrinsic improbabilities or defects in his story he has been offering indefinite or fragmentary answers. When his Eskimo companions are cited in evidence against him, he tells us that their talk was merely in pursuance of his injunctions to them to conceal the facts. Now comes the only witness of his great mountain feat, the only man whose testimony was available to him in confirmation of the ascent of Mount McKinley, and declares, under oath, that this claim is an elaborate lie from beginning to end. And this witness is not in the frozen North; he can doubtless be produced at short notice. If Doctor Cook is an honest man, he will demand that this be done, and that the whole case, North Pole and Mount McKinley both, be cleared up at once and completely. From now on, he ought to be spending his days and nights in the work of clearing his honor; and every dollar that he takes in henceforward by exploiting his claim when he ought to be removing the cloud on it, will be a dollar gained at the expense of his reputation for honesty.

LOMBROSO'S WORK.

A career of extraordinary mental activity, and of very marked influence on the currents of the time, has been brought to a close by the death of Professor Lombroso. Few men have done so much to stimulate interest, and call forth effort, in the study and handling of the problems of criminality; and if giving an impulse to inquiry is to be regarded as a cardinal service to progress, Lombroso is entitled to very high recognition. Restless energy in seeking new material to work upon and fearless readiness to promulgate whatever results his enthusiastic search for new truths seemed to furnish, formed a combination highly favorable to the effectiveness of such a propaganda as that with which Lombroso's name is associated; and it is a question upon which there will always be room for dispute whether the advancement of knowledge in matters having a human interest is more in need of such boldness and zeal as his to set things agog, or of that patient and thorough investigation, and that spirit of scientific rigor, which gain results more slowly, but with less admixture of error. The man of the Lombroso type becomes possessed with a general idea of which he is temperamentally incapable of seeing the limitations. His function thereafter is that of an insistent disturber of the peace, a man who compels others to give attention to what has been neglected in the past; and if he does this at the cost of disseminating a vast amount of inaccurate reasoning and exaggerated statement, it is for others to sift the good from the bad. In a domain of enormous complexity, he accepts a simple dogma upon inadequate evidence, and after that all individual facts are unhesitatingly interpreted in the light of that dogma. This is not science, as the modern man understands science; but it may be a powerful instrument for stirring up activity and bringing about improvement.

It is admitted on all sides that Lombroso's insistence on the part played in criminality by congenital physical attributes has strongly influenced both the theory of criminology and the practice of penal and reformatory institutions. It is even possible that, so far as the actual application of his principles has thus far gone, it has been productive of almost unmixed good. Practice is sure to lag behind theory, in such a matter; and as the practice of ages had erred so absolutely on the other side up to within two or three generations, there has been little danger in our time of excess in the direction of too great regard for the personal peculiarities or the inherited tendencies of prisoners in our penal institutions. But when it comes to the influence on general opinion, on the formation of that attitude toward the question of crime which, prevailing in one generation, is destined to be the basis of action in the next, the case is very different. If the habit were to become general of regarding criminals as a special type of the human race, and of placing the responsibility of criminal acts not upon the man who has committed them but upon his heredity and environment, there could not fail to result a gradual but steady undermining of the whole notion of personal responsibility for crime or immorality. And the danger of such a development is greatly increased by the widespread but entirely mistaken notion that the voice of Lombroso and his school is the voice of science. He and his followers—and his predecessors—have accumulated a vast aggregate of particular facts, and they have drawn emphatic attention to some aspects of those facts which had previously been insufficiently attended to; but they have established no broad scientific conclusion, they have undermined no great conviction previously entertained by thinking people in general.

Just where the line is to be drawn between absolutely unavoidable criminality and criminality that can be held in restraint by the operation of ordinary human motives is a matter for determination or discussion by persons who give their lives to the study of such subjects; for the every-day man it is sufficient to know that the cases are extremely few in which the criminal impulse is so deep-seated and imperative as to be utterly beyond the reach of what, for want of a better name, we call the will. With these extremely few cases he need not burden his thoughts, any more than he thinks of the albino

as one of the important varieties of man, or of death by lightning as one of the ordinary incidents of life. Leaving out such extreme cases, the doctrine of Lombroso, however useful his insistence upon it may have proved in the ways that have been indicated, is really nothing new. We all know that one man differs inherently from another, according to the inheritance he gets in his blood; we all know that the abjectly poor and the excessively rich have less chance for the development of a normal moral character than those placed in a more wholesome situation. But we also know that the very moment any of us ceased to regard himself as subject to the standards to which the mass of our fellows is held, he would lose the mainstay of his whole moral being. No piling up of technical particulars can obscure this central fact, or so much as diminish its importance by an iota.

Not observation or dogmatic theorizing is wanted for the illumination of a fundamental truth like this; in so far as it is an explicit intellectual quality at all, as distinguished from what we call insight, or common sense, it is the faculty for sound logic. And in this faculty the representatives of the kind of scientific activity of which the work of Lombroso is an example have always been signally deficient. It is the kind that used to tell us that women's intellectual powers were scientifically proved to be less than men's by the simple fact that their brains weighed less; it is the kind that thinks to establish the identity of genius with insanity by simply picking out the curious peculiarities of many men of genius. Qualitatively, we have known all along that criminality was partly heredity, that genius was more or less abnormal; quantitatively, it is to be doubted whether Lombroso's work, valuable as it may have been in some aspects, has advanced these theses far beyond Dryden's "Great wits are sure to madness near allied," or that still older declaration that the sins of the fathers shall be visited upon the children to the third and fourth generation.

CHESTERTON ON SHAW.

The wicked red beard of Bernard Shaw is turning gray. He permits himself the thread-bare conventionality of evening dress. He is about to reap the golden harvest of his American celebrity by a lecturing tour. Finally, enters Mr. Chesterton with a biography prefaced by the following note, which is not without a touch of that Renaissance impudence of self-praise occasionally deprecated in Mr. Shaw: "Most people either say that they agree with Bernard Shaw or that they do not understand him. I am the only person who understands him, and I do not agree with him." All these things have a significant look—can old Caspar's work be done? "Who was Hall Caine?" asked Mr. Shaw, when, as a younger man, he was industriously knifing his way toward the limelight. It is still too early to found a reputation as a wit by asking, Who was Shaw? It would even be unjust to suggest that this tour and this biography look like an attempt at a Shaw "revival." For the "few years of immortality" which this puissant jester aspired to enjoy before going into the darkness with Shakespeare and other out-of-date writers are not yet at end. The time has come, however, when the insolent Shavian advertising no longer fills us with astonishment or dismay, or disables our judgment from a cool inspection of the wares advertised. The youthful Athenians who darted most impetuously after his novelties are already hankering for some new thing. The deep young souls who looked to him as an evangelist are beginning to see through him and despair, as they saw through the exquisite and inexplicable Maeterlinck, and despaired when he took to the motor-car. It is fortunate, therefore, that at this critical time the one man who has really understood Shaw has spoken out and told us what part of him is of the earth earthy and what part immortal.

Mr. Chesterton loves to give the devil his due. He looks upon the subject of his biography as a kind of high-minded, keenly intellectual, but misguided angel. At heart, he insists, Shaw mysteriously unites Irish saintliness with Puritan austerity and a deep passion for progress. He labors with only moderate success to prove that the man is fundamentally consistent, serious, and responsible. With much greater plausibility he praises him for having made philosophy popular and popular amusement philosophical. Philosophy here needs a word of qualification; it means in this connection the latest German, Russian, and Norwegian views of religion, politics, society, art, morals, property, and, in short, all discussable objects of thought. In the years when Shaw was earning his bread as dramatic critic he went to the theatre with an enormous and omnivorous appetite for new ideas. He saw there plays with more or less excellence of dramatic technique but devoid of intellectual stimulus. He went away empty and disgusted and determined to reform things. The first step in reform is destruction, and for that he had a splendid talent. When he had insulted managers and public into giving him a hearing, he made them look at their daily lives from several angles which they had never before visited. "Shocking absurdity!" exclaimed some. "Delightful originality!" exclaimed others. "Not at all," replied Shaw himself in his singularly candid and almost pathetic preface to the "Plays for Puritans," "I am a crow who have followed many ploughs. No doubt I seem prodigiously clever to those who have never hopped, *hungry and curious*, across the fields of philosophy, politics, and art." Nevertheless he had accomplished his purpose; he had set every one by the ears. He had demonstrated the possibility of interesting jaded play-goers by a frontal attack upon their sense without assaulting their senses or their sensibility. He had broken the polite and bored silence of society with a peal of Aristophanic laughter. It is infinitely better to laugh than to yawn, especially if, with Mr. Chesterton, you define a yawn as a "stifled yell."

But in Mr. Shaw's laughter there has been a certain inhuman quality which is already telling against him. He has exhibited an unearthly delight in laughing alone. One is forced to suspect that the driving power behind even his positive ideas is his fierce desire to be ahead of the crowd. Mr. Chesterton is very charitable on this point; he finds in Shaw a genuine temperamental inability to understand the vitality and validity of tradition and convention. Thus, "That Marx was not with him was important. That Man was not with him was an irrelevant prehistoric joke." This is the generosity of an enemy. Mr. Shaw formed the conviction that there could not be "two Shakespeares in one philosophic epoch." He therefore attempted, with the help of Schopenhauer, Nietzsche, Ibsen, and other dyspeptic aliens, to force upon the innocent English people a new philosophic epoch;

not because the new was better than the old, but because it was different; not because the English felt the need of being philosophical, but because Shaw felt the need of being Shakespeare. His love of intellectual adventure and his sheer lust to be first ally him less with the great dramatists and thinkers than with recent geographical explorers. In these days, the only undiscovered land lies in the uninhabitable regions around the poles. You may still figure in the headlines by reaching the South Pole. But you cannot plant colonies or found a new world there, because no one can live there. Mr. Shaw has been essentially a polar explorer. Having dashed through No Man's Land to the intellectual poles, he has cried to the rest of the world, "How funny you look down there!" And now the rest of the world, ably encouraged by Mr. Chesterton, is beginning to cry, "How funny you look up *there!*"

Mr. Chesterton's biography is not a joke. It is as serious as his life of Browning or his life of Dickens. Indeed, it is more serious: it is as serious as the "Life of Jean Jacques Rousseau" by Samuel Johnson, which, by the way, was never written, or as the "Life of Percy Bysshe Shelley" by T. B. Macaulay, which was never written, either. That is to say, it presents in sharpest conflict two totally different ideals; it is the Shavian Superman against the Chestertonian Englishman. Mr. Shaw trusts in himself and his foreign allies, and appeals to the future. Mr. Chesterton relies upon the bulk of the English race, and appeals to the past. Mr. Shaw wishes to be as unlike everyone else as possible, and to bring literature around to himself. Mr. Chesterton wishes to be more like every one else than any one in his generation, and to restore English literature to its central traditions. He is thinking of Dickens and Johnson and Fielding and Dryden and Ben Jonson and Shakespeare. He is very weary of the Pre-Raphaelites, the Paterites, the followers of Wilde, the Nietzscheans, the Ibsenites, and all manner of æsthetic dandies, neoterics, and exotics—of whom he is obliged to regard Mr. Shaw as one. If he praises beer with an exaggerated emphasis, it is because they have praised absinthe, and beer is English; if he extols beef, it is because they have extolled caviare or vegetables, and beef is English; if he glorifies marriage, it is because they have attacked marriage, and marriage is English. If he has declared for romance, it is because Shaw has declared against it, and romance is English; if he has spoken for patriotism, it is because Shaw has spoken for cosmopolitanism, and patriotism is English; if he accepts God, it is because Shaw rejects God, and God is English. Shaw has drawn out the strength of Chesterton as the arch enemy drew out the strength of the angel Gabriel. Putting the case in American terms, it is fun to spend the Fourth of July with Shaw, but it is pleasanter to keep Thanksgiving, Christmas, and New Year's with Chesterton.

NEWS FOR BIBLIOPHILES.

According to the published extracts of the will, the late Robert Hoe has instructed his executors to sell his library and art collections at auction, leaving it to their option whether the material be offered in New York, London, or Paris. While the French books, and possibly the manuscripts, might bring better prices abroad, it is generally believed that the early printed books, as well as the English and American books, would sell as well or better here. It is hardly probable that the collection will be offered in one continuous sale. That was the old way. For example, the catalogue of the great Roxburghe library said that the books would be sold "on Monday, 18th May, 1812, and the forty-one following days, Sundays excepted." Nowadays, with values so much enhanced, the catalogues are divided into different portions and sales are held several months apart.

No copy of that very rare Thackeray item "Flore et Zephyr" (1836), a small folio pamphlet consisting of eight plates slightly tinted enclosed in a cover, has been offered at auction in this country since the Augustin Daly sale in 1900, when two copies were disposed of—one, with the original drawing of one plate inserted, fetching $850, the other, with the plates cut around and mounted, bringing $420. This latter copy will be again offered as one of the attractive items in the library of the late Wilhelmus Mynderse, to be dispersed by the Anderson Auction Co. on October 28 and 29. The Thackeray collection comprises seventy-six lots, and is one of the most extensive ever offered here. The two college periodicals, the *Snob* (lacking four numbers) and the *Gownsman* (lacking Nos. 1 and 2), also from the Daly library (where they brought $115), are included, as well as "Vanity Fair" (1848) in parts, a fine set; "The Second Funeral of Napoleon" (1841); "Comic Tales and Sketches" (1841); and "An Interesting Event" (1849). The Dickens collection is also extensive, including three copies of the first edition of the "Pickwick Papers" (1837), one being in parts; "Sketches by 'Boz,'" both series (1836-37); the Christmas Stories, 5 vols., first editions, in original cloth; and other items. Poe's "Tales of the Grotesque and Arabesque," 2 vols. (1840); a set of Cruikshank's "Comic Almanacs," 19 vols. (1835-53); Fielding's "Tom Jones," first issue, 6 vols. (1749); Irving's "Sketch Book" (1819-20); Edward FitzGerald's copy of Goldsmith's "Life of Richard Nash" (1762); and first editions of Smollett, Scott, Lowell, Longfellow, Holmes, and Hawthorne, are other noteworthy lots.

Earlier in the week, on October 26 and 27, the same firm will sell the second part of the library of Collin Armstrong. In this portion are included some of the publications of the Kelmscott, Merrymount, and Roycroft Presses; collections of the first editions of Andrew Lang, William Morris, Stephen Phillips, Swinburne, and Charles Godfrey Leland; first editions of "The English Dance of Death" and "The Dance of Life," with other books illustrated by Rowlandson, etc.

On five days, October 25 to 29, the Merwin-Clayton Sales Co. will sell the second part of the library of Charles M. Wallace of Richmond, Va. Catesby's "Natural History of Carolina" (1754), with colored plates; Shelton's translation of "Don Quixote" (1620), the first edition in English; Humboldt's "Vues des Cordilleres" (1810), with colored plates; the first edition of the "Letters of Junius" (1772), and a collection of "Junius" literature, are notable items included in this part.

On October 27 and 28, C. F. Libbie & Co. of Boston will sell the libraries of Dr. James R. Nichols of Haverhill, Mass., and C. E. Tuttle, of Rockland, Maine. The Halliwell-Phillipps Shakespeare, 16 vols., folio (1853-65); Roberts's "Holy Land" and "Egypt and Nubia" (1842-46); Jardine's "Naturalists' Library," 40 vols. (1834-38), with 1,242 colored plates; Sowerby's "English Botany" (1853-72), with upwards of 1,800 colored plates; Meyrick's "Inquiry into Ancient Armour," 5 vols. (1842-54); Surtees's Sporting Novels, 5 vols.; first editions of American and English Authors, and a series of Maine town histories and genealogies, are included.

Correspondence.

SCIENCE AND INAUGURATIONS

To the Editor of The Nation:

Sir: In an editorial on "Science and Culture," in your issue of June 17, you conclude as follows: "If those masters (of scientific technique) themselves see this (that the heart of education is still the knowledge of men and not of things) our humanist need not shudder over Dartmouth choosing a physicist for president." I felt moved at the time to remark that in other countries this tendency to shudder is not experienced. Among the physicists who are, or have recently been, at the head of British Universities there occur to me Lord Kelvin, chancellor of the University of Glasgow; Lord Rayleigh, chancellor of the University of Cambridge; Sir Oliver Lodge, principal of the University of Birmingham; R. T. Glazebrook, successor to Lodge as principal of University College, Liverpool, and now head of the National Physical Laboratory; the late J. Virlamu Jones, principal of the University of Cardiff, and his successor, E. H. Griffiths, noted for their determinations of electrical and thermal constants, respectively; and Principal Loudon of the University of Toronto. But Dr. Nichols has now been inaugurated

president of Dartmouth, with due pomp and dignity, and, apparently without a shudder. Dartmouth men, from the venerable ex-president to the youngest undergraduate, seem to be profoundly pleased and confident of the future. We may then leave this question for the present. I have lately attended three interesting inaugurations, which have given rise to some thoughts that are concealed in the following lines.

The inauguration of President Nichols, like that of President Lowell the week before, was a spectacle of great picturesqueness and imposing academic ceremony, worth going far to see, and never to be forgotten by the participants. Among the delegates from other colleges were upwards of a score of fellow physicists, who had come to show their loyalty and affection for their colleague. In the afternoon they were hospitably entertained in the laboratory, where those beautiful experiments on the pressure of light were made that had carried the names of Nichols and Hull to many a corner of Europe, where the name of Daniel Webster was unfamiliar. That the names of these delegates should have been, with singular unanimity, omitted from the press reports, is not to be laid to any snobbishness on the part of the press, which had room only for the names of presidents of universities, but is merely a symptom of the attitude of the public to the president and the professor respectively. In the eyes of the public, the professor, on becoming a president, is endowed with marvellous learning, and is an authority on all possible disputed subjects, from the spelling of a word to the settlement of labor disputes. He is an "educator"—the terms *savant* or *Gelehrter* not being needed in the English (or American) language, for these indicate a producer of learning, a notion which is still somewhat foreign, and under suspicion. To the public the president is the outward and visible sign of the university, he is the coal, the gasolene, the steam, the boiler, the engine, the dynamo, the light, the power. He setteth up and he putteth down. He furnishes policies, and he puts them through. He is the executive, the legislative, and the judicial. Is he—and, if so, why? European observers of our university conditions with one accord ask this question. Prof. Angelo Mosso, in his book, "La Democrazia nella Religione e nella Scienza," says:

> In Italy we are true republicans in the matter of instruction, for the professors vote for the choice of the rector, and the liberty of teaching is so great that the state pays republican and socialistic professors, who openly carry on propaganda against the institutions and the form of government wished by the majority. In America no one understands that this might be possible. The universities are under the despotic power of a president who has unlimited powers, appointing and deposing at will professors, who do not constitute, as with us, a corporation of learned men jealously protected by law. At first sight it seems a paradox to say that where liberty is greatest there tyranny is greatest, but really it is so.

The papers have commented on the fact that President Nichols, in his inaugural, did not announce a new policy. Why should he? Dartmouth seems to be getting on very well as she is. Dartmouth men seem to be enthusiastic and united, and to possess the traditions of democracy. I saw no automobiles in Hanover belonging to students. It is proverbial that "honesty is the best policy," and this we have had in the inaugurals of Presidents Nichols, Lowell, and Maclaurin. All have admitted that student conditions are not at present ideal, and all have expressed optimisim as to their becoming so. All favor general culture, which Maclaurin at least says cannot exist to-day without some acquaintance with science, while the others go nearly as far. What steps seem necessary to be taken is pointed out clearly by Dr. Lowell, and the theory so long prevalent at Cambridge, that equal volumes have equal weights, or that everything is as good as everything else, seems to have received a severe blow.

As I began with science, so let me end. What the colleges think of the claims of science may perhaps be inferred from a study of their honorary degrees. At Harvard, if my memory serves me, out of about thirty honorary degrees five were given to American scientists and seven to foreigners. Of college presidents degrees were given to about six. I am told that an effort is to be made to raise the value of the degrees of Doctor of Science and Doctor of Letters, and that the degree of Doctor of Laws is to be kept for distinguished public servants, and for college presidents. At any rate, this seems to be the plan at Dartmouth. Sixteen purple hoods were bestowed with this most honorable degree *ex-officio* on presidents of colleges, while one doctorate of science was conferred on a president who was also a scientist. An Englishman present called my attention to the different character of the degrees from those conferred at a Cambridge or Oxford convocation, where the *ex-officio* degree is usually absent. It may be questioned how much good these degrees do which presidents pass around to each other. I was told that one of them had upwards of one hundred, and used a card catalogue to keep track of his hoods. Into this purple curia or academy let no geometer enter. The scientists must be satisfied with the more modest yellow.

Is there any way to encourage men to go into science, or is there any place in this country for pure science? Science is, like virtue, its own reward. The scientist can obtain neither money, headlines, nor velvet hoods. Unless, indeed, he take out patents enough, when he can obtain all three. In France they do these things differently. At President Lowell's dinner, when Prof. Joseph Bédier was called upon he immediately launched into a panegyric of the Collège de France, recalling the names of the great men who were among its founders. Of these I recall those of Ampère, Regnault, Foucault, and Champollion. Perhaps we should have more such names if we earnestly desired them. I remember seeing upon the walls of the lecture room in the École Polytechnique the motto "Pour la patrie, la science, et la gloire." Surely an inspiring phrase for the young Frenchman, not as good, perhaps, as the motto "Veritas," but more concrete. We are told now at every breath that the watchword of the educated man must be "service." True enough. Did not Newton serve England when he invented fluxions and discovered the law of gravitation? And yet I suspect he was not thinking of that, but did it because he could not help it. A student once told me that he thought it was foolish to be always talking about cultivating science for the good of the world. "The reason we do it," said he, "is for the fun we get." I suspect he was right. On the title page of the works of one of the greatest living physicists are the words: "The works of the Lord are great, sought out of all them that have pleasure therein." That we may have this pleasure, and that we may share it with generous youth, is the chief desire of the scientist.

ARTHUR GORDON WEBSTER.

Worcester, Mass., October 17.

A NEW ARCHÆOLOGICAL LECTURESHIP.

[To-day Mr. James Loeb, formerly of Kuhn, Loeb and Company, New York, endows the Charles Eliot Norton Memorial lectureship in the Archæological Institute of America. Previous gifts by Mr. Loeb have made it possible to secure several foreign scholars of note as lecturers for the institute; the new foundation will provide an income which will be expended in accordance with the terms of the letter to the president of the institution accompanying the gift. This letter, which outlines a type of endowment likely to be productive of lasting benefit, and expresses at the same time an appreciation of Professor Norton's services to art, we are permitted to print in full. —ED. THE NATION.]

Professor Francis W. Kelsey,
President of the Archæological Institute of America, Ann Arbor,

My dear Sir: I take pleasure in informing you that I have instructed my secretary to pay over to the treasurer of the Archæological Institute of America on October 21 $20,000 of the 5 per cent. bonds of the United States Steel Company for the endowment of the "Charles Eliot Norton Memorial Lecture Fund."

The annual income of $1,000 is to be paid as an honorarium to one or more distinglished archæologists for a course of lectures to be delivered before the affiliated societies of the institute. In choosing the lecturers preference is to be given to European scholars, but in the discretion of the council invitations may also be extended to American scholars.

The experience of past years has amply demonstrated that a constantly growing public eagerly avails itself of the opportunity which these lectures afford to keep abreast of the latest researches of a science which is constantly increasing our respect for the achievements of antiquity. I deem it a privilege to endow the institute with a fund that will enable it, for all time, to help, not only its members, but also the general public, to enjoy the fruits of future archæological discovery.

October 21 marks the first anniversary of the universally regretted death of Prof. Charles Eliot Norton of Harvard University, and this day seems peculiarly appropriate for the creation of the endowment. He was the real father of the Archæological Institute of America. Thirty years ago he had the satisfaction of seeing the idea which he had long and enthusiastically fostered in the minds of a small company of scholars, take concrete form in the estab-

lishment of the Institute, whose services to learning have amply justified his eager hopes. It is fair to say that one of the most far-reaching of these services lies in the opportunity given to a selected body of young students to inspire themselves at the actual sources of ancient culture. Our universities lose no time in appointing these young men, and their teaching is giving new life and vitality to an important branch of learning.

Two generations of Harvard students were privileged to hear from Professor Norton's inspiring lips what "man's sacrifice to beauty," as Mr. Henry James has well called man's artistic effort, has done for the uplifting of the race. To them the establishment of the Charles Eliot Norton Memorial Lecture Fund will, I hope, be a welcome event. To that larger circle who knew and valued Mr. Norton for his fearless devotion to his country, for the delightful essays and scholarly public addresses which marked the stages of a long and singularly distinguished life to the pursuit of *res humaniores*, it may serve as a token of the devotion and admiration of one of his pupils.

Yours faithfully, JAMES LOEB.

Villa Waldfried, Murnau a/Staffelsee, September 8, 1909.

ENGLISH AND CLASSIC VERBS.

TO THE EDITOR OF THE NATION:

SIR: The September *Harper's* contains an interesting article by Mr. J. C. Fernald on "The Simplicity of English," in the course of which occur the following words:

> The Greek verb has 1,138 parts, which the simpler Latin was able to reduce to no less than 444. Here the English language has broken all precedent. The most complicated English verb, the verb *be*, has but eight different forms, *be, am, is, are, was were, being, been.* The verb *be* is alone in this proud distinction. No other irregular verb has more than five changes of form; as, *give, gave, gives, giving, given.* A regular verb has but four changes of form; as, *love, loved, loves, loving;* and out of at least 8,000 verbs in the English language, all except a little list of 200 are regular.

There are several remarkable things in this statement. First, we rub our eyes to see whether we have read aright. Only eight different forms? Where are the forms *art, wast, wert?* And why are *givest, giveth, gavest* omitted? And *lovest, loveth, lovedst?*

Again, it would be interesting to know how Mr. Fernald obtained his number 1,138 for the parts of the Greek verb. By assuming that some one theoretical verb could at the same time be in both the conjugations and exhibit all possible variations of pure, mute, and liquid verbs in all possible tenses, and by counting all duplicate forms, that number might be arrived at—possibly might be exceeded. But 507 is the number given by Curtius, "Das griechische Verbum," edition of 1877, page 5. This makes forms enough, in all conscience: Curtius calls this "Fülle" "eine erstaunlich grosse" (p. 3), and carefully gives his method of computation. He omits what he considers to be real duplicates, but he counts λύω twice, λύσω twice, and ἔλυον twice. In his enumeration of the forms of the Latin verb he gives 443, only one less than Mr. Fernald's number. I do not know the method of counting in this instance. *E. g.*, the series *es, et, emus, etis, ent* meets the learner of the Latin verb in three conjugations, in two different tenses and two different moods. Are these counted as 5 or as 15? A good illustration of the wide variation between truthful answers to the same question would be afforded in answering this: "How many forms does a boy have to learn in order to inflect a Latin adjective of the first and second declensions?" One person thinks (taking *bonus* as his model): "three genders, six cases, two numbers; 3x6x2=36." Another one reflects that *bona* and *bonis* each occur six times; that *bonum, boni, bonæ,* and *bono* are each found four times, and *bonorum* twice; so he replies "thirteen different forms," deducting nearly 64 per cent. of the other answer.

But when it comes to the method of expressing one's meaning by inflections, have not most of us felt that while we were about it we had rather learn more forms instead of fewer, in order to be sure of what we were saying? When the *Nation* itself was a boy, I dare say it (or "he") would rather have learned a separate set of forms for each of the three series *ēs, et,* etc., mentioned above, than to be obliged to determine whether it was dealing with a present or future indicative, or with a present subjunctive.

Nor is the English verb itself as easy as one might think, judging merely by the paucity of simple forms. The foreigner has to learn a double set of tenses for many verbs, and if the sentence is negative or interrogative, there is still a third mode of expression, which may have to be used. "Jack writes home once a week." "Jack is writing; don't bother him." "Jack is not writing." "Jack does not write often enough." "Is Jack writing now?" "Does Jack write home often?" In Latin and Greek *scribit* and γράφει serve for all of the variations. The foreigner may say: "I am believing both Cook and Peary," and then wonder why "am believing" will not work as well as "am receiving."

To go back to the Greek verb for a moment, its mass of forms may easily be made much less formidable than would appear at first sight. Thus Curtius counts 70 forms for the future, active and middle. Does a boy have to learn 70 new forms? Not a bit of it. He learns that an inserted sigma was the future sign; this one fact gives him all of the 70 forms instantly, the present tense, of course, being already known. And if we insert before the sigma of the future middle the syllable θη we have the future passive without more ado, which disposes of 35 more of Curtius's forms so that the learning of two facts gives a knowledge of 105 forms. I have often seen beginners look with dismay at the columns of contracted verbs, as if it were all entirely new material. But tell them that three "rules" (or statements) will show them how to get all the shortened forms of φιλέω, and three (it would be two except for the omission of iota in τιμᾶι) will serve for τιμάω, and the feeling of dismay is apt to vanish.

To close with a sigh: Just suppose our simple English had a phonetic system of pronunciation! ADDISON HOGUE.

Lexington, Va., October 12.

CHAUCER SPEAKS.

SIR: I have recently noticed what seems to be another of the rare cases in the "Canterbury Tales" in which Chaucer apparently forgets for the moment the supposed narrator of the story and speaks in his own person. It is in "The Squire's Tale" (F. 278-82), in the description of the dancing which follows the banquet of Cambinskan. The lines are:

> Heer is the revel and the jolitee
> That is nat able a dul man to devyse,
> He moste han knowen love and his servyse,
> And been a festlich man as fresh as May,
> That sholde yow devysen swich array.

It may be urged that the modesty of the squire leads him to speak thus, but, however this explanation might account for the "dull," it would scarcely do so for the third and fourth lines. In the "Prologue" we read of the squire:

> Singinge he was, or floytinge al the day;
> He was as fresh as is the month of May . . .
> So hote he lovede, that by nightertale
> He sleep namore than dooth a nightingale.

It seems singular that Chaucer should make the squire excuse himself because of his ignorance of the very things about which he obviously knew the most. On the other hand, Chaucer, "hore and rounde of shape," who often pleads his dulness, might very naturally speak in this way of himself.

A NATION MAKER.

Sir George Grey, Governor and High Commissioner. By James Collier. (Makers of Australia Series). Christchurch, Wellington, and Dunedin, New Zealand: Whitcombe and Tombs, Limited.

Seventeen years since, September 8, 1892, we reviewed Rees's "Life of Sir George Grey," virtually an autobiography, touched up here and there by the hand of an ardent admirer and coworker. Since then other lives of Grey have appeared, notably this one by Mr. Collier, who, though an admirer is at the same time often sharply critical Grey has passed to his account: the Boer war, the federation of Australia, and at this moment of South Africa, have taken place, events with which his career stands in close relation. America, moreover, has taken on the character of suzerain and patron of "backward races" in the South Pacific. For the

whole Anglo-Saxon world, the story of this pioneer, "head and shoulders above all other colonial governors," as Mr. Collier asserts, has acquired new significance; his course was fraught with great successes, and also with mistakes. Both have important lessons for English and Americans, struggling in the difficult path, where he broke the way. We may appropriately consider him again.

Sir George Grey was allied (to understand him we must take into account his blood) with a famous English family. In him, however, there was a strong Irish infusion, and from his mother, a Vignolles, he derived a Huguenot strain. He was, moreover, not a native of England, being born in Lisbon, in 1812, shortly after his father, at the head of the Thirty-third Regiment, had been killed at Badajoz. Almost of course he became a soldier, but arms for the moment being silent, the laws prevailed with him, and he entered upon a great work of political development and administration, the preface to which was a bold exploring of western Australia. He was governor of South Australia, twice governor-general of New Zealand, and twice high commissioner in South Africa, involved as was no other man in the upbuilding and ordering of the vast English speaking societies of the South Seas. The account is full of thrilling and picturesque incidents, for which we must refer the reader to Mr. Collier's excellent book, confining ourselves to a description of some of Sir George Grey's policies. In projecting and carrying out these, he shows himself to be a wise and indefatigable statesman, though fallible, and a man before his time.

First, his dealing with savage races is a thing worthy of our study. Probably no other administrator has had to do with savage masses so numerous and varied—the Australian type, the Maoris of New Zealand, Kaffirs, Zulus, Hottentots in South Africa. A spirit of kindness and justice pervades his policy here from first to last. That "occupancy" merely, the roving over land by hunters without attempt to till or improve, constitutes for a wild tribe valid title to soil, is a doctrine held in small respect by Anglo-Saxon men. Dispossession has been ruthless; or if now and then a conscience has been sensitive, it has been easily quieted; a few bales of blankets, or cases of cheap trinkets, or casks of fire-water, have in numerous instances transferred to white newcomers areas that now have become States, and there has been no compunction. Not so with Grey. In his view the barbarian had a right to his habitat, though peopled only sparsely, and utilized only for the chase; it could not be justly taken from him without the return of an equivalent fully adequate, and an obligation was always recognized that a hand should be lent to the backward race that it might rise in the scale. Here Grey was charged with extravagance. The colonists did not agree with him, and even a man like Earl Grey, a foremost English statesman, disapproved, declaring that mere "occupancy" gave no valid title, and to assert otherwise was quixotic. Extravagant, too, most men will think, were Sir George Grey's ideas as to amalgamation. It was perhaps the Frenchman in him, always more prone to alien interminglings than the Anglo-Saxon, which led him to look with favor upon a blending of the English, especially with the Maoris, a race wild, indeed, but of peculiar aptitudes and promise. The blending has not come; probably in the nature of things such a blending never could come about. Here, as in various other ways, Grey was impracticable. Whatever his mistakes and fatuities, it remains that no other administrator has more endeared to himself the hearts of backward races, or managed them more effectively for their own good and the peace of the world.

In Australia, the response to the young governor's cherishing from tribes unusually debased was feeble. Far otherwise in New Zealand. Though Grey would always be master, enforcing his authority upon occasion by soldier's methods, his policy with the Maoris was that of a sympathetic friend and protector. He sought them in their huts, learned their language, studied deeply their traditions, stood between them and the land-grabber, schooled them, insisted upon their legislative representation, and though his scheme for amalgamation was futile, strove for a society in which the two races might amicably exist together. Good-will and confidence came in return from the capable and intelligent race, who, to this day, almost remember no other governor than Grey. In South Africa, too, the blacks were marvellously tamed, and brought forward by the governor's strict justice and kind, tactful discipline. A notable instance of his extraordinary control over them occurred during the Indian Mutiny. Recognizing the danger he stripped his own colony of soldiers and arms, and drew heavily on its resources, to reinforce, in time, the English struggling in Bengal. He believed that he saved India to the English, a claim which Mr. Collier thinks arrogant. At all events, the service was very great. But what we wish to note especially here is his curiously quixotic, dare-devil way of dealing with the natives in the emergency. He had just been at war with them; but confident in their complete submission, brought about no more by force than by kindness and justice, he visited each important chief, telling him frankly what had been done, that England was in a perilous crisis, that the colony was quite bare of defenders, and he relied upon the chiefs to observe in the strait the strict terms of peace. The policy was brilliantly successful. While those who knew of the governor's action trembled lest their late enemies might seize the opportunity to wipe out the colony, not a chief made trouble. All stood steadfast in their friendship, the dependency usually so turbulent was as quiet as England itself, while its fighting men were arrayed in distant Hindustan.

In the second place, Sir George Grey's dealings with his own people, the white colonizers of the new lands he was set to govern, were no less interesting than his dealings with the browns and blacks. In his youth in England he had been profoundly moved at the condition of the masses, and he undertook the exploration of western Australia especially in the hope of laying open regions into which might be poured the thousands who had neither room nor opportunity at home. He had always the welfare of the humbler classes in view in all his various fields; and when the rich and high-placed tried to establish land monopolies, the result of which would have been a feudal condition, a few rich proprietors on one side, a multitude of dependent tenants upon the other; or when ecclesiastical bodies unwisely projected a theocracy in which, while natives and immigrants stood in docile tutelage, a hierarchy was to control and direct, Grey withstood both priests and monopolists, however powerful, however well-intentioned in their mistaken zeal. His ideal was to constitute societies made up of modest homes—each settler with one vote in Anglo-Saxon fashion sending representatives to a central legislature, the heads of the polity to be magistrates with power derived from the suffrages of the freemen like themselves, whose interests they were set temporarily to administer.

Without dwelling upon the details of his interesting struggles here, we pass to the consideration, in the third place, of Sir George Grey's relations with the government at home, from which he derived his authority, and to which he was always held responsible. While the Colonial Office usually sustained him, and sent him repeatedly to deal with dangerous, sometimes desperate, situations, he was never thoroughly approved, and was sometimes discountenanced and condemned with wrath and disgust. We have space to describe only one of his high-handed proceedings, which was widely felt in England to threaten no less than the integrity of the British Empire. South Africa, it will be recalled, with a white population of Dutch, was taken from Holland and assigned to England as a colony by the Holy Alliance in 1815.

In the fifties of the nineteenth century its main divisions were Cape Colony, in which the Dutch element outnumbered the English, and the Orange Free State and Transvaal, almost entirely Dutch. Natal had at that time attained no great significance. Grey, set to rule here as high commissioner, found a land in which allegiance to England was naturally weak, fighting for existence with warlike Kaffirs and Zulus. To his pacification of the savages we have already referred. To content the colonists, he projected a remarkable plan. He was always proud of his own Huguenot descent, and kept it to the fore. This made him *persona grata* with the Dutch, among whom there was a large Huguenot infusion. Their good will he reciprocated, and he had much sympathy with their grievances. His project for South Africa was a confederation, in which, while the speaking of English was to be encouraged, Dutch must necessarily be the dominant language in legislature, society, and schools. The tie binding South Africa to England was, in fact, to be greatly attenuated: a population prevailingly Dutch was to receive a large measure of independence; a state set up in which the tongue, traditions, and allegiance had their root rather in Holland than in England. Downing Street found the scheme high-handed and intolerable to the point of treason. Grey was temporarily disgraced; yet, if his plan had been carried out, it would have saved England the humiliation of the Boer war, and from the point of view of world statesmanship, it would have been a happy consummation. At the present hour South Africa is confederating along lines which, except that he would have guarded more carefully the rights of the native races, are in the main the lines laid down by Sir George Grey—an impressive vindication of his breadth and wisdom.

Grey's proconsular career closed in 1867, after which he continued to figure, nevertheless, in England and in the South Pacific. His election to Parliament was thwarted by Gladstone, who thought dangerous his advocacy of Irish Home Rule, a policy which he did not himself adopt till some years later. Had he reached a seat in Parliament, his force and eloquence would have made him a power among the Liberals. In private, his influence was great with the leaders of church and state, as well as the masses, and exerted for human betterment. In New Zealand, he was active in subordinate stations, serving as representative, like John Quincy Adams, in the land he had once ruled as chief. As a delegate to the confederation of Australia, in 1891, he favored a course which was heavily disapproved. In several ways, it was radical, most so in advocating as head of the Federation, not a crowd-appointed governor, but a magistrate elected by the people, thereby almost sundering the last tie between mother-country and dependency. Mr. Collier does not mention it, but we believe it a matter of record that Sir George Grey dreamed of a much wider confederation—of English-speaking men, namely—and was quite ready to yield the primacy in such a bond to the United States, first by virtue of resources, numbers, and character.

Mr. Collier is nearly as often a drastic critic of his subject as he is a eulogist. He asserts Grey to have been arrogant, vindictive, disposed to claim credit which did not belong to him, and a falsifier of history through strange hallucination as to what he had really done; nevertheless, he finds him brave, nobly altruistic, brilliantly sagacious, of unflagging energy. He was a cosmopolite rather than a patriot, a world-statesman not to be pent within a circumscription as broad even as the British Empire. He was insubordinate almost to the point of rebellion; but in many ways the world came round to him, and it was held fitting at his death in 1898 to accord him a sepulchre in St. Paul's, close to Nelson and Wellington.

He was an Achilles, held by the heel when he was dipped and the hand that held him was very broad; he was very open to the arrow of the fault-finder—but an Achilles, nevertheless, the foremost champion in the wide and windy arena in which he played his part. Says Carlyle: "He was born of the Tetragonidæ, built four-square, solid as one fitted to strongly meet the winds of heaven and the waves of fate." To this it may be added that his character was marked no more by strength than by justice and humanity.

CURRENT FICTION.

La Catedral. Por Vicente Blasco Ibáñez. Valencia: F. Sempere y Ca.

The Shadow of the Cathedral. Translated from the Spanish by Mrs. W. A. Gillespie. New York: E. P. Dutton & Co.

Judging by the pages we have compared, Mrs. Gillespie's translation is reasonably adequate, though neither inspired nor free from blunders. Her rendering of *pordioseros* as "God's creatures" is not happy. "For-God's-sakers" would be better, if any word but "beggars" had to be sought at all. In one relief of the Toledo cathedral the translator professes to have found a figure of the Virgin "robed in the habit of St. Ildefonso." This would certainly be so great a curiosity that surprise alone should have led to a more narrow scrutiny of the text. It reads, "vistiendo una casulla á San Ildefonso," that is, "investing St. Ildefonso with a chasuble." It is to be hoped that not many slips in the book are so bad as that.

The novel itself is put into English dress at a time when its themes are even more to the fore in Spain than when the author wrote of them. For be it understood that we have here no ordinary *novela de costumbres* or romance, but a tract for the times. Señor Ibáñez chose the narrative form simply as a vehicle for the bold discussion of ideas which are fermenting in the Peninsula. In the person of Gabriel Luna, a species of combined atheist and philosophical anarchist, returning to his old home in Toledo to die of consumption, we have the protagonist of the plotless drama. Wide wanderings and deep reflection have given him a rooted distrust of the dominant principles in modern Spanish civilization, and in long discourses to friends and relatives he pours out his heart about the church and the army, education and politics, social organization, industry, Spain's past and future. Considered as a story, it must all be voted tedious. Too often does the reader find it recorded that "Gabriel habló largo rato." His monologues are frequent and wearying. Yet one sees a marked and significant *Tendenz* running through the rather poor imitation of a story. That is why this work of Señor Ibáñez's has had so great a vogue in Spain; and why, just at this juncture, it might well serve as a guide to the kind of intellectual and moral upheaval now going on in that country. With the greatest frankness the large topics of religion and government are debated in these pages; and one cannot help feeling that the recent terrible events in Barcelona, and elsewhere in Spain, have come as a sort of confirmation of many of the views here expressed in the name of Gabriel Luna.

The Faith of His Fathers. By A. E. Jacomb. New York: Dodd, Mead & Co.

Among the multitudinous forms of the modern novel, there is one which, with a kind of dreary ardor, sets itself the task of studying some particular human character or situation of a kind both typical and humdrum. Its object is not to inspire a high pity or terror, but rather to put us in absolute possession of certain definite facts which, dingy enough on the surface, may or may not turn out to possess some hidden lustre of meaning. It is an exhibit, a "human document," presented in the true modern spirit of accumulation. To this class, a hasty reader might be inclined to ascribe "The Faith of His Fathers."

Its field of vision is at first glance narrow and flat enough—a middle-class nonconformist household in a dingy English small town. We seem to have beheld and heard it all before: the bigoted father the patient yielding mother, the rebellious son and daughter, the crisis which sets one generation against the other,

the final parting of their ways. The present treatment seems rather careful than emphatic. We see that these people and this developing situation are authentic, but no particular reason offers itself for our pretending interest in them. The stern faith of the father and the revolt of the son are alike untouched with charm. The son is, indeed, barren of grace to the end; but the father is gradually perceived as a figure of deep pathos, almost of tragedy. The absolute sincerity of his grim Puritanism reveals itself as untouched by petty vanity or self-will. Fidelity to his creed has prescribed for him a course of action inhuman to any mind not bound by the tenets of his own sect. But he is not inhuman, he accepts the crucifying of his natural affections in the martyr spirit. His fate is to make himself an object of pity and contempt to his children, to lose his place of usefulness in the world, and finally to incur the bitter hatred of the wife of his youth. Yet at the end of it all, one cannot imagine a different course of action for him, or a different fate. His is the mistaken martyrdom of the fanatic, not the *débâcle* of the weakling or the brute. The skill with which the dignity of the Puritan character is cumulatively impressed upon the reader marks this story, with all its dreariness, as a sincere and fruitful piece of interpretation.

The Man of Destiny. By Thomas Gold Frost. New York: Gramercy Publishing Co.

The civil war chieftain is not a new apparition in American fiction, but he has yet to win second immortality there. Why is it that the voices of our story-tellers grow strained and self-conscious the moment they undertake to sing the glories of a patriotic past? Why is it that the great personalities they attempt to reconstruct for us turn out such manikins? The greater the historic figure, the greater the difficulty of the fanciful chronicler. It is, in fact, we suppose, an easier task for the creative imagination to build a creature new than to illumine and project before one's very eyes a being who has undergone actual fleshly birth and dissolution. The Washington or Lincoln of the novelist too often bears grewsome resemblance to those "controls" of spiritism, who, vaunting great names, turn out to be after all such trifling fellows. No doubt there is a similar barrier to be surmounted. One is dealing here also with the creatures of two worlds, of two different sorts of reality. At their most coherent, these spooks and shadows are least impressive. The dust of Alexander is more respectably employed in stopping a bunghole than his spirit as pilloried by a Mrs. Piper, or dragged babbling through the pages of an historical romance.

We mean no serious personal reflection upon the author of the present fiction. He has a love for his theme, and he means well by it. He has written out of a commendable enthusiasm for a great figure of our near past. Why, with his minute attention to the fact, he chooses to call Grant "Burton" is not clear. If the chronicler left any doubt as to his hero's identity, the illustrator would settle it. The change of name has left the narrator free to provide dialogue, letters, and, above all, a "love interest" departing widely from the facts of Grant's life and character as stern history knows them. Nevertheless, the prefatory assertion that this is "primarily a work of fiction" is at least open to doubt. The author evidently did not know quite what he intended it to be "primarily." Eventually, it is an odd mixture of fact, fiction, and panegyric.

Pa Flickinger's Folks. By Bessie R. Hoover. New York: Harper & Bros.

Every one knows them, either in real life or in the magazines, whence they now come forth with additions, making a complete family circle. They live in a city on the shores of Lake Michigan and are the plainest of plain people—fathers and sons, mothers and daughters, babies single and in twinship; the common North American busy at common duties and diverted with democratic pleasures. The rudely candid American tongue holds a sway practically unbounded till the family's softer graces are brought to light by the alliance of Bill Flickinger with Sophie Budzbanowsky, "Catholic Pole," whose gentle counsels bring into harmony the turbulent Flickinger currents. The family hopes, fears, merrymakings, and misadventures brawl along in a channel of noisy humor, comic, cheerful, and clean.

AN ITALIAN NIETZSCHE.

On the Tracks of Life: The Immorality of Morality. Translated from the Italian of Leo G. Sera by J. M. Kennedy, with an introduction by Dr. Oscar Levy. New York: John Lane Co. $2.50.

Since Christ divided all mankind into sheep and goats, there has been no partition of society quite so simple as that of Signor Sera. For him all men are either aristocrats or workers or transitional—impure—types between the two. The aristocrat is born with an instinct for leadership and self-assertion. In sport, war, and love he spends himself extravagantly. He declines to be bound by the morals that the timid majority regard as necessary for their preservation. Requiring abundant leisure for the growth of his peculiar potencies, he is a parasite, living by the work of other men, upon whom he imposes himself by his superior readiness and force. Women yield gladly to his ardor. Indeed, an imperative and conquering sexuality is the symptom—or possibly the cause: the author is not altogether clear on this point—of his aristocratic prerogative. In conclusion, he rejects bounds except as they are dictated by his own instinct; and his ruling character is that of a splendid and efficient animalism. It is the southern temperament at its highest power.

The worker is, naturally, the antithesis of all this. Work is the great moral and physical depressant. Society requires of the natural man—who, presumably, was an inchoate aristocrat—the sacrifice of individual passions and ambitions. Thus by a steady depressant policy society forms the dutiful, self-sacrificing worker. In the process his egotisms, and particularly his sexuality, are attenuated. As he sacrifices initiative, egotism, all that means individual potency, he acquires social merits. He is fit to produce and save against the need of the great consuming and spending class of aristocrats. The worker is northern in temperament: cautious, tender, meditative.

Here surely is simplicity. If it be asked, Is there no intermediate class? the answer is, Only transitionally and in appearance. When the worker arrives at full consciousness of his subject condition, he will, if his intelligence suffices, try to better it. He will play cleverly within the prescribed bounds, or he will break them, in which case he is on the way to aristocracy. Again, when the aristocrat loses his potency, he loses his reality. Italy, in Signor Sera's opinion, has no real aristocracy to-day, the nobility being impotent. As for the artist, the genius, he is the purest sublimation of the aristocratic temperament. The working class, on the contrary, abounds at the top in merely clever, or elegiac men of talent.

A society, a nation, at any given stage, is merely an equilibrium struck in the eternal strife between worker and aristocrat. Nations lacking leaders simply lie fallow. The storehouses are being filled for future enterprise—for the use of leaders to come. Such nations, we say, have no history. Germany for centuries has been in this preparatory state of study and conservation. The national temperament, at the top, at least, is becoming aggressive, egotistic, sensual; the dawn of leadership is discernible. England has used up her aristocrats and a period of decline is at hand. History is merely a record of these balances between saving and spending. National success implies the aristocrat fully in control, but supported by the accumulated knowledge and wealth of generations of workers; and such a condition is unstable. The aristocrat spends too much of himself or the social store, the worker rebels, the leaderless nation lapses into social morality—and insig-

nificance. The ideal equilibrium was reached just once and for a brief time in Greece. As if to illustrate concretely the sensuousness of the aristocrat, an essay on Henri Beyle's amorous life is added, and by way of proper acknowledgment of inspiration, a paper on Nietzsche.

We have epitomized this argument fully and objectively because it offers a clear-cut picture of the world—a picture that to readers of Brantôme and the tracts of Machiavelli will even seem to have an historical verisimilitude. The potent aristocrat, the shifty or sheerly imbruted worker, have existed and do exist. The question is whether they exist in the purity of type, or in the preponderating influence, assumed by Signor Sera. Let us recall that his book is intended to be merely descriptive and analytical. He treats, as he often declares, the world as it is. His book is to be taken as a reasoned catalogue of human nature. Taken as such, its classifications appear to us brilliant, specious and superficial.

The magnificent animal which he imagines the aristocrat to be, seems to us a pure figment. To realize him intellectually required all the genius of a Nietzsche. In history, the leader has appeared from time to time. Even so, he has rarely been quite true to type, and never frequent enough to constitute what Signor Sera posits: a special species within the genus *homo*. For example, the depressant qualities of pity, moderation, altruism, and intellectualism have been present and even prominent in most of the actual leaders known to history. As to sexuality, while it is obvious that any powerful person will gratify his passions more boldly, it is doubtful whether the aristocrat is especially favored in this regard. Every class of society from top to bottom produces its Lovelaces. Signor Sera could find his sexual conquerors as readily in the stable as in the palace. So far is sexuality from being an index of general superiority that very inferior men will exercise an extraordinary adroitness and forcefulness in the pursuit of their pleasures. Is the village Don Juan an aristocrat after all?

The notion of the aristocrat seems to us, in fine, purely fictitious: a clever but obviously invalid generalization from such exceptional cases as Antony, Attila, Cæsar Borgia, the Marquis de Sade, perhaps. We have to do not with a kind of race within mankind, but either with sheer abnormalities, or with men simply a degree stronger, wiser, and more audacious than their humbler fellows. The term aristocrat—though alluring when the most imbruted sort of worker is cited by way of contrast, seems to us entirely without physiological or psychological significance. There is a good literary reason for cherishing this type. To assert that it moves the world is quite another matter.

Equally exaggerated we find the insistence upon the depressing effect of work and upon workers as a category to include the greater part of mankind. That work is a depressant, in many cases may freely be admitted. The coal fields, for example, tell that story only too well. But in whole classes of the community work not only produces value to society, which Signor Sera regards as a unique function, but enhances the value of the individual. The improved *morale* brought about by military and naval drill is thoroughly understood. It would be difficult to show that surveyors, engineers, drivers of horses, navigators of vessels, builders, or, indeed, professional men or fine craftsmen, are belittled by their work.

In fact, Signor Sera's notion of a quite untrammelled personality seems to us highly sentimental and unscientific. It is as if a changeling from Rousseau's loins had been foisted upon Friedrich Nietzsche. There has been no time when this superb unconditioned animal has constituted a ruling class. There have been the crazy Cæsars and the degenerate Bourbons, but no wise publicist will base his system upon them. No, from palace to hovel we are none of us free—society imposes bonds upon us and our class; our inner selves devise even more cunning trammels. Least of all has the aristocrat of history been free. Bound by complex codes of honor, by hereditary duties, by all the manifold obligations of nobility, his lot has been cramped, as compared, say, with that of his own clerk, or his shifty money-lender. So well did a better thinker, Nietzsche, perceive this, that he set himself to creating, not a ruling class, but a few portentous Supermen, to secure which he clearly saw that pity must first be annihilated. The fatal weakness of Signor Sera's argument is that, without exception, the major premises are not proved but assumed.

We have given more attention than it quite deserves to this sprightly book. Even under the veil of a translation that abounds in such barbarisms as "glottology" and "involucre," it is pungent, stimulating, and, to a plodding reader, disquieting. It presents a picturesque and suggestive, if hardly novel, notion of the rise and fall of nations. It puts into modern garb the old scarecrows of Machiavelli and Hobbes, and strips Nietzsche of most of his poetry, hence of his difficulty. We are willing to believe that Signor Sera is honestly fascinated by his own paradoxes. We can only say that his mirror of the world simplifies a complex image out of all familiarity. But his theses are clearly and vigorously expressed, his book is very diverting, or very shocking, according to the reader's temperament, and, after all, nothing sharpens the teeth of the mind like setting them firmly into a fallacy of the tougher order.

The Origins of Christianity. By the late Charles Bigg, Regius Professor of Ecclesiastical History and Canon of Christ Church, Oxford; edited by T. B. Strong, Dean of Christ Church. New York: Henry Frowde. $4.15

This is a disappointing book. The promise of the title is not fulfilled, for it is not with the origins of Christianity but with its history from Nero to Diocletian that the author deals. Nor is the work of the quality one might expect from the Regius Professor of Ecclesiastical History in Oxford, whose Bampton Lectures on "The Christian Platonists of Alexandria" have long been well and favorably known. The book was not written for professional historians, but for a wider public, and so should not perhaps be criticised because it contains nothing new and unfamiliar, though it is certainly a mistake to suppose that an author must necessarily confine himself wholly to conventional material because he has others than scholars in view.

A more serious defect is the superficiality of treatment. Even as a summary of familiar matters, it lacks vitality, insight, and imagination. It is commendably accurate, and bears witness to the author's learning and to his acquaintance with the best modern literature—it is not in any sense a bad book. But just because of this its futility is all the more apparent and all the more annoying. The very arrangement of the material betrays the shallowness of the treatment. The book is divided into thirty-seven chapters, one of them printing but two pages, and more than a third of them carrying the name of an emperor as title, Domitian, Trajan, Hadrian, etc. It would be a miracle if with such a table of contents the book itself were anything but scrappy and superficial. External biographical details, bibliographical notices, and accounts of persecutions bulk large, while the really vital things, such as the inner meaning of the new faith, its appeal to the peoples among whom it spread so rapidly, the forces which shaped its development, its influence upon the world and the world's influence upon it, all these are overlooked or treated in a most casual and inadequate way. The chapter on the Apologists, in which an account is given of the principal writings and the arguments used without any attempt to get at the heart of the situation, or at the real significance of the Apologists' task, is but a sample of the unsatisfactory character of the whole book. Even a chapter with so promising a title as the Church at the Close of the Second Century yields little more than a series of details touch-

ing organization and liturgy, matters which properly belong in an encyclopædia of Christian antiquities, not in a history of Christianity. The final chapter, entitled A Review of the Third Century, is much better, but is all too brief and is taken up largely with such conventional topics as private confession, asceticism, and celibacy of the clergy. Though the old anti-Romish polemic has happily almost wholly disappeared from recent church histories, the traditional interests still continue to dominate them, and questions which were formerly bitterly debated between Catholics and Protestants, or between one and another Protestant sect still form the staple of discussion. This is particularly true in England, where perhaps the old differences have been longest in dying out, or where, at any rate, the historic spirit has been longest in outgrowing them.

It is to be greatly regretted that since the death of Edwin Hatch scarcely any work of importance has been done by English scholars in the field of early church history. Conventional, stereotyped, or apologetic treatments of the subject are about all that have appeared. Of freshness and originality, and particularly of large and constructive work, there has been little. Canon Bigg's book is no greater sinner than many another. It is simply one more mediocre book where there are already too many.

Journals of the House of Burgesses of Virginia. 1752-1755 and 1756-1758. Edited by H. R. McIlwaine. Richmond, Virginia.

This volume, the second issued by the present State librarian, consists of the Journals of two General Assemblies, the first comprising pp. 1-332, and the second pp. 333-551. There were eight sessions of the first Assembly, and four of the second. The custom adopted in the preceding volumes of printing the names of the Burgesses has been somewhat changed, as they are now given for the whole term of the Assemblies, with notes showing changes during the terms, instead of, as heretofore, appearing before each session of the Assembly: hence we have but two lists, instead of twelve.

As is well known to those interested in this publication, the printing was begun with the volume for 1773-1776, and has proceeded backwards, so to say, so that it has now reached the sixth volume. This plan was presumably adopted from lack of the earlier journals, which it was intended to supply as the printing continued. The importance of the publication has been heretofore commented on, and, indeed, is understood of itself.

The first session of the Assembly of 1752-55 began on February 27, 1752, being the first session of an Assembly since 1749. Gov. Dinwiddie arrived in Virginia November 20, 1751. In his address to the Assembly he recommended first "that some way should be found to prevent delays in the courts of justice," and, secondly, "that good relations should be cultivated with the Indians in order that the French and Spaniards—particularly the former—might not be able to carry out their designs of settling in the interior." The fact that "the King in council had repealed ten acts passed by the preceding Assembly," prevented the fulfilment of the first recommendation, but the Assembly, on April 6, 1752, passed "An Act for encouraging Persons to settle on the Waters of the Mississippi." Such settlements had previously been made in Virginia (as of the Huguenots at Manikin Town, King William County, and of the Germans at Germanna, in Spotsylvania County), as a protection against inroads of the Indians. This kindly feeling, however, soon changed on account of the dispute over "the pistole fee." The Governor required the payment of a pistole ($3.50) as a fee on the issue of a patent for land at the secretary's office. This led to a pamphlet by Richard Bland, "A Fragment on the Pistole Fee, Claimed by the Governor of Virginia," which has been edited by W. C. Ford. The claim angered the Burgesses, especially after their handsome present, and they inquired by what authority the Governor made this demand. He replied that the order was given "in accordance with the authority granted him in his instructions from the home government and with the advice of the Council," and that the matter was one with which the House of Burgesses could not constitutionally deal. This did not satisfy the Burgesses, but the House passed a resolution, "That whosoever shall hereafter pay a pistole as a fee to the Governor for the use of the seal to patents for lands shall be deemed a betrayer of the rights and privileges of the people," and they sent the Attorney-General, Peyton Randolph, to London to investigate the matter. The editor states that "in this dispute Dinwiddie was technically in the right," for the land was the King's land, and that the "fee was ill-advised, but not illegal." It, however, destroyed the amicable feeling between the Governor and the Burgesses, and affected the sum appropriated by the House of Burgesses after Washington's mission to the French commandant in regard to the disputed territory in the Ohio Valley.

The capitulation of Washington at Fort Necessity on July 4, 1754, caused another session of the Assembly. The House passed a bill to raise £20,000 for the campaign, but attached a rider for the payment of Peyton Randolph's claim of £2,500 in the matter of the pistole fee, to which the Governor would not agree, so the bill failed. The House eventually backed down and passed the bill.

The Assembly of 1756-58 first met on March 25, 1756. The Governor hoped for a change in the membership, and there was a change of about thirty-eight per cent. But "the old leaders were returned, and it may be doubted if the change in personnel was of any great advantage to the Governor in his efforts to control the House." It declined to send men to Crown Point on account of the danger at home; it passed a bill for the appointment of an agent in England, to which the Governor was opposed; and it offended him "by sending the sergeant-at-arms with his mace within the bar of the General Court, and compelling certain officials of that court who were members of the House to attend its meetings." It passed an act to raise £25,000 for the better protection of the inhabitants on the frontiers, and to erect a chain of forts. Among these one was to be immediately erected at Winchester, Fort Loudoun, the remains of which may still be seen there. Washington's letters set forth the alarming condition of affairs, and an act was passed to allow members who were officers of militia to repair at once to their respective posts. The Assembly did its best to meet the emergency.

The feeling between the Governor and the Burgesses was now more harmonious, and the Governor announced his intention of resigning on account of his health, which he did in January, 1758. Gov. Fauquier did not reach Virginia until June 7; in the meantime John Blair, president of the Council, was acting Governor.

There are still errors of proof in this volume, but the proofreading has improved.

Essays in Politics. By Andrew Macphail. New York: Longmans, Green, & Co. $1.80 net.

British imperialists who base their hopes on preferential tariffs are vigorously attacked in this book of Mr. Macphail's. The Canadian writer, who is here a student of economic and political conditions, offers not a grain of encouragement for politicians of the Chamberlain school. Mr. Macphail sees only danger in the forging of tariff links for empire welding, and relies upon race loyalty to open up the way to political coherence in any future British federation.

In the best essays in this book, which relates chiefly to Canada, the main argument is against the economic theory of protection. Certain phases of Canadian loyalty are criticised, as well as the impatience of advice and rebuke from headquarters that has so often

made a decision in the Foreign Office at London, or an award in which long views were necessary, the occasion of colonial discontent. Mr. Macphail shows how Canadian statesmen have sometimes failed to understand how complicated an affair is that great world in which Britain has to decide questions that must be regarded, not in the feebic light of the court room, but in the lurid glare of war. In other words, so long as Canada and the other young nations remain members of the empire without fully sharing its responsibilities, they must submit, in their negotiations with other countries, to compromise which in whole or in part rejects their claims. The opposition of Lord Alverstone to his Canadian colleagues in the Alaska boundary award is justified now by some who strongly resented it at the time. Lack of appreciation of the length, breadth, and thickness of imperial interests has too often vitiated colonial opinion of British diplomatic difficulties.

It will surprise American readers, we think, to learn that in this book confession has at last been made that the British government got what they were not entitled to in the Maine boundary case and came out ahead in the Oregon difficulty. Nor will they fail to season their humor with sober reminiscence when they read of Lord Elgin's festive hoodwinking of the Senators at Washington into accepting the famous Reciprocity Treaty of 1854-1866: one of the cleverest strokes in the history of diplomacy. This was the treaty "floated through on champagne." Mr. Macphail reminds his countrymen that, so far as this continent is concerned, certain limitations were inexorably imposed upon British diplomatic effort by the surrender of Cornwallis, and that Canadians must learn the lesson of compromise by which widely dispersed empire is maintained. The same lesson, he avers, must be learned by the United States. The book is well calculated to offset aggressive publications that assume preferential tariffs as the indispensable basis of federation. As might have been expected, there is a chapter on current political questions in the United States; and in this, Mr. Macphail makes many just observations on our shortcomings, while sometimes going far afield in his conclusions. He says in one place, for instance:

> That is why there is no public opinion in the United States and no political discussion in their newspapers—for the same reason that there was none in Turkey previous to July [1908].

We are not concerned to examine the reason or occasion for this statement, as its exaggeration is patent. Such a statement as this is quite sufficient to suggest the rashness of inference into which the writer of this book is sometimes betrayed. But, for all that, there is much in it that rings clear and true.

Notes.

"American Prose Masters"—essays by W. C. Brownell on Cooper, Hawthorne, Emerson, Lowell, Poe, and Henry James—is an important new publication soon to be issued by Chas. Scribner's Sons.

New evidence of the serious appeal of H. G. Wells, in England if not in our own country, is offered in the issue, through Unwin, of a volume by the Rev. Alexander H. Crawford, entitled: "The Religion of H. G. Wells, and Other Essays."

A translation by W. S. Hough and W. R. Boyce-Gibson of Prof. Rudolf Eucken's "Die Lebensanschauungen der Grossen Denker," rendered in English as "The Problem of Human Life as Viewed by the Great Thinkers," is offered by the same publisher. The winner of the Nobel prize studies in this volume, much read in Germany, not merely the philosophies of the past, but also the present situation. Eucken belongs to the more conservative wing of modern pragmatism.

Joseph Pennell is as well qualified to draw as is Mrs. Pennell to discuss the "French Cathedrals," and the volume which is the product of their collaboration, and which the Century Co. will publish, is likely to prove one of the most beautiful of "gift books." The 183 illustrations from drawings by Mr. Pennell are after originals in the Luxembourg Museum.

The successor of Gaston Paris at the Collège de France, Prof. Joseph Bédier, will deliver a course of five lectures on "The French Epic Legend," at the University of Chicago, beginning November 29.

Sturgis & Walton Company will issue this month the first volume of the Court Series of French Memoirs, translated from the manuscript of Cléry, valet to Louis XVI, under the title, "The Royal Family in the Temple Prison: The Journal of its Confinement."

For Lacy Collison-Morley's "Giuseppe Baretti" (Scribner), the late F. Marion Crawford wrote an introduction which gives added interest to an account of the subject's literary friendships and feuds in the days of Dr. Johnson, Garrick, and Sir Joshua Reynolds.

The Doves Press will issue in November "William Caxton," a paper read by George Parker Winship, librarian of the John Carter Brown Library, Providence, at a meeting of the Club of Odd Volumes in Boston, in February, 1908. The essay will be issued in small quarto, and printed in black and red. The three hundred copies to be issued will be bound in boards, paper sides, and vellum backs, at 10s.; or in morocco or sealskin at £2 10s. There will also be 15 copies on vellum.

On October 23 Houghton Mifflin Company will issue a volume, "American Foreign Policy," which seeks to analyze the present situation in world-politics. The author states the newly gained importance of America in international affairs, and makes his due proportion of suggestions for our future course. A certain added interest may, perhaps, be found by some readers in the circumstance that the title page bears no trace of authorship other than the words, "By a Diplomatist."

Hermann Hagedorn, whose "Woman of Corinth" was published last year by Houghton Mifflin Co., will make his reappearance as a poet in "A Troop of the Guard, and Other Poems," to be issued through the same publishers. The title poem of the new volume was read at the Harvard Class Day of 1907, and it is safe to say that it has not been forgotten, even now, by those who attended the academic performances in Sanders Theatre. The new book contains besides "A Troop of the Guard" and other verses, the Lincoln Ode read last February at the Philadelphia Academy of Music, other odes, and a one-act-play, realistic in action, although poetic in form, and philosophic in temper: "Five in the Morning."

The proposed British expedition to conquer the South Pole is enthusiastically approved by the Royal Geographical Society. The opening article of the October number of its organ, the *Geographical Journal*, contains a letter from President Darwin to the leader, Capt. R. F. Scott, in which he promises "every help it is in our power to give." The aim of the expedition is twofold, to cover the remaining one hundred miles between Mr. Shackleton's farthest point and the Pole, and the further exploration of the Ross Sea area. The start will be made not later than August, 1910, in order to be at the base of operations in December. It is hoped that much light will be thrown on the nature and extent of the great ice barrier, and that the study of ice-physics will be promoted as the result of the purely geographical work. The officers and crew for the expedition have been selected and arrangements have been made for the purchase of the whaler Terra Nova. In this number there is also a summary of the narratives of Cook and Peary without criticism or expression of opinion, which is reserved "till fuller information is available."

Nature intended Samuel McChord Crothers for the ideal celebrant of Dr. Holmes's centenary, as any one may learn by reading the little volume published by Houghton Mifflin Co., under the title "Oliver Wendell Holmes: The Autocrat and His Fellow Boarders." If the chief advantage offered in these centenary celebrations is to provide one generation with the opportunity to speak its mind of another with a candor and an insight not always given to contemporaries (and this is the suggestion of the London *Times* reviewer, in praising Lewis W. Townsend's biography of "the little doctor"), there is an appropriateness in its being Dr. Crothers who uses the "candor and insight" in writing of the earlier New England humorist. The essayist mentions the fact that Holmes began to write in college, and wrote on till, in extreme age, "the pen dropped from his hand"—adding that his pages were "meant more especially for readers who have a personal interest in the writer," as the writer himself asseverated. And, like other persons who write much about themselves for publication, he had little to say in private—in his letters, for instance. Every reader of the "Autocrat" series has, undoubtedly, a certain inti-

macy with Dr. Holmes: Dr. Crothers drives home this point. There is a crispness and brevity, however, to the essay which prove that the essayist has a will to apply his own maxim: "The writer who is unusually fluent should take warning from the instructions which accompany his fountain-pen: When this pen flows too freely it is a sign that it is nearly empty and should be filled." Dr. Crothers is at his best in his appreciation of his subject's nimble wit —which was, he tells us, "a safety-match which struck fire on the prepared surface of the box in which it came. Boston was the box."

The amateur spirit recognizable in Dr. Holmes's prose is even more marked in his verse. Indeed, "he was not a poet in the usual sense of the word," writes Dr. Crothers. To "The Chambered Nautilus" alone, among his poems, does the critic concede artistic completeness. And "The Chambered Nautilus" is, very properly, the eleventh and last of the sheaf of poems which, with Dr. Crothers's essay, makes up the little book. As for the essay itself, its satire is as harmless as the earlier Doctor's. And it brings that Doctor before us again in wonderfully clear definition—one is reminded of that pen-picture by a contemporary which gives him "a powerful jaw and a thick, strong underlip, that gives decision to his look, with a dash of pertness. In conversation he is animated and cordial—sharp, too, taking the words out of one's mouth."

In honor of Prof. Francis B. Gummere's twentieth year of teaching in Haverford College, ten of his former pupils have published a volume of studies in modern literature under the title "Haverford Essays." The articles, covering a wide range of subjects, will, for the most part, be of interest mainly to specialists in the various fields. C. G. Hoag discusses the logic of argument with particular reference to current text-books on argumentation, which he finds generally deficient in logical coherence. S. G. Spaeth argues that Milton possessed a rather highly technical knowledge of music. W. S. Hinchman contributes a gently impressionistic interpretation of George Herbert. C. H. Burr studies the original poetic impulses in the younger Wordsworth. A. G. H. Spiers offers a stylistic criticism of Dante's "Vita Nuova," chapters xxiv to xxviii. J. A. Lester points out some Franco-Scottish influences on the early English drama. C. W. Stork institutes a comparison of Heine and Tennyson as exemplars of national characteristics. W. M. Hart examines Chaucer's "Franklin's Tale" as a specimen of narrative art. C. H. Carter investigates the origins in universal folk-lore of the mediæval romance, "Ipomedon." W. W. Comfort treats of the Moors in Spanish popular poetry before 1600. The volume is privately printed and published. Copies may be obtained by addressing the secretary of Haverford College.

There have been so many books recently going over about the same field as John Fyvie's "Wits, Beaux, and Beauties of the Georgian Era" (John Lane Co.) that it is not easy to be fair to the latest comer. Mr. Fyvie's chapters will be lively reading to those who are not too familiar with their themes; they will sound pretty stale to those who have kept up at all with the recent anecdotal literature of the eighteenth century. The longest of the sketches is given to Samuel Foote, who ought to be very entertaining, but somehow is not. That on Elizabeth Chudleigh is virtually a reproduction of a sketch in "Seven Splendid Sinners"—not because Mr. Fyvie has plagiarized, but because he necessarily draws on the same limited sources of information. The chapter on George Selwyn is well informed, but fails—a fatal failure in a book of this sort—to take full advantage of so picturesque an incident as Selwyn's expulsion from Oxford for participating in the sacrileges of the Medmenham "Franciscans"; and, while setting forth the truth of Selwyn's taste for executions, it fails to draw out the psychological curiosity of combining such a taste with a genuine tenderness for children. The Countess of Suffolk contains at least one quotation that has not become stock in trade—the extraordinary letter of George II to the Queen on hearing that his "vieille maîtresse" had married George Berkeley. The chapters on George James Williams and the Duchess of Queensberry are an old, old story. Those on the Rev. John Warner, D.D. and Melesina Trench are comparatively fresh. Mr. Fyvie writes conscientiously and with a fair degree of vivacity.

Notwithstanding the voluminous literature of the later slavery struggle in the United States, no satisfactory explanation has hitherto been offered of the suddenness with which Congress and the country, after apparently general acceptance of the compromise of 1850, plunged into the great controversy over the Kansas-Nebraska bill. To most students of the period, the bill seems to have come, as Jefferson said the Missouri controversy came, "like a firebell in the night." The initiation of the bill has usually been ascribed to Douglas, notwithstanding Douglas's announced determination, in 1851, "never to make another speech on the slavery question." The customary explanation, to which even Mr. Rhodes lends the weight of his authority, has been that Douglas's action in the matter was a bid for the Presidency, though Professor Burgess ascribes to him the more worthy motive of believing that the principle of the bill was the true one for the United States to observe in dealing with slavery in the Territories. It has been reserved for Prof. P. Orman Ray, of the Pennsylvania State College, to examine the whole subject afresh, and to offer what we think must henceforth be regarded as the true explanation of this epoch-making bill. In "The Repeal of the Missouri Compromise" (Cleveland: The Arthur H. Clark Co.), Professor Ray uncovers for the first time the political conditions in Missouri which for several years had made the opening of the Nebraska country an issue of increasing importance, and which formed a large element in the opposition to Benton, with the resulting destruction of Benton's State leadership. However much the East and South might affect to regard the compromise of 1850 as a finality, the demand in Missouri and Iowa for the further extension of slave territory continued loud and insistent. Professor Ray's investigations seem to show conclusively that the real author of the Kansas-Nebraska legislation, though not its sponsor, was David R. Atchison, Benton's implacable political enemy, and successor in the Senate. The evidence in support of this contention is too detailed to admit of summarization here, and we can only commend Professor Ray's volume as a sound piece of historical work and a contribution of first-rate importance. Incidentally, the book is another striking illustration of the need more and more recognized by students, of reëxamining the critical episodes of our constitutional history from the standpoint of State politics.

The monumental compilation, "Poesie di Mille Autori intorno a Dante Alighieri" (Rome: Forzani), to which we have several times referred, is completed with the publication of the fifteenth volume, which appears after the death of the compiler, Carlo del Balzo. This volume covers the period which ended with the Dante celebration in 1865. It contains, besides a sheaf of productions in Italian, including Frigeri's drama "Psiche e Bice," poems in Slavic by Anna Vidovicena, in German by Julius Schanz, and in Dutch by E. I. Potgieter. An appendix gathers up several earlier pieces that were overlooked, among them Hans Sachs's "Dantes der Poes von Florenz." Each piece has biographical, historical, and bibliographical notes, representing an immense labor in research. Del Balzo spent twenty years on this monument to Dante, which is, so far as we know, unique: for no other world-poet has had such an anthology of tributes. Del Balzo was one of the most vigorous of the contemporary literary men of Italy. This compilation was his avocation; his chief original product consisted of ten novels in which, after the fashion of Balzac's "Comédie Humaine," he attempted to depict Italian life, high and low, as it is. He also served as a republican deputy, coming through ten years of parliamentary battles with the respect of all parties. He was born in 1853, and died April 25, 1908. His Dante compilation deserves a place in every important library. It embraces over 400 authors in some twenty or more languages.

The recent volume of Wilhelm Wünkhaus, entitled "Der Humor Jesus" (Evangelischer Verlag), is a reverent attempt to show that in the teachings of Christ genuine humor is a not unimportant element. The author investigates the contents of the gospels, maintaining what Kingsley already said of humor: *Hominis est, ergo Christi est, ergo Dei est.* It is questionable, however, whether the author does not at times find humor in Christ's sayings where none was intended.

Two volumes of Paul Hinneberg's "Kultur der Gegenwart" (Leipzig: B. G. Teubner) appear in second and enlarged editions, the valuable "Geschichte der Christlichen Religion," which includes sections by such distinguished authors as Harnack, Wellhausen, and Jülicher, and the interesting and weighty "Systematische Christliche Religion," which has such contributors as Herrmann, Troeltsch, Seeberg, and H. J. Holtzmann. In the latter the veteran and confirmed antagonists, Herrmann the Protestant and Mausbach the Catholic, expound on adjacent pages and from their distinct points of view the systems of morals which they regard as Christian. Impartial scope is offered also to both confessions in the exposition of doctrine and of disputed periods of ecclesiastical history. Bet-

ter department of each side toward the other based on more thorough mutual understanding, is confessedly one of the designs of the series. It is probable that the main topics of Christian history and doctrine, as held by the two great divisions of Christendom, were never expounded with greater clearness, thoroughness, and succinctness, and by men better qualified to treat him, than in these volumes. In the new editions fuller treatment is found of the Christianity of western Europe in the Middle Ages, and of the history of Protestantism and Catholicism since the sixteenth century, the latter from the pen of Albert Ehrhard.

In a book that is not to be taken too seriously, yet which does add to the material at hand for discussing either a possible *entente* or a possible war between the nations concerned, Karl Bleibtreu writes of "Deutschland und England," not as cousins, but as brothers (Berlin: Karl Curtius). It will not be Bleibtreu's fault if German and Briton are not soon swearing an eternal *Bruderschaft*. One result will be, he writes, to upset that balance of power which the Yankee has of late been so rapidly creating for himself. This author of war tales credits the Englishman with having stirred himself of late to study Germany more—the result of Germany's forcing herself to the front among nations; but declares that John Bull still knows far less of Germany than the Germans do of England. The hateful failure of English world-politics has caused many Anglo-maniacs in Germany to become Anglo-phobes; both nations cry out *Carthaginem esse delendam*, and yet the more the one knows of the other, the more must the desire be felt to prevent the retrogression of either. For Russia and France must ever remain England's rivals, and Germany is the only country (Bleibtreu can at will forget the Yankee in his calculations) which may be relied upon to stand over against the two, on England's side. This volume discusses, too, the salient differences in British and in German history, compares the military and marine power of each as it is to-day, and investigates trade conditions and colonial expansion, besides treating of matters of art and of literature. English sculpture is declared to be so *übel* as to give one a feeling of distress on seeing it, whereas English pictorial art leads the world; the scheme of the Kaiser in plotting his *Sieges Allee* may have got a little out of joint, but London, architecturally, is a monstrosity. This writer claims that only in their willingness to marry for love, and without any thought of money, are the English and Americans superior morally to the Germans; and suggests some caustic tests of the German and English ideas of liberty.

John Prentiss Poe, of the family of the poet, died at Ruxton, Md., October 14, aged seventy-three years. He was a former attorney-general of Maryland, dean of the law department of the University of Maryland, and codifier of the Public General Laws of Maryland, in two volumes.

Moses Grant Daniell, educator, died in Boston October 18, aged seventy-three years. He was the editor of many texts, had composed a number of Latin grammars, books of exercises, etc., and had for some years prior to his death held a position in the editorial department of Ginn & Co.

Elie Fourès, "cigalier et félibre," has died at Meudon, near Paris. His reputation as a poet depended chiefly upon his "Ondeline." For some years he has been working upon an exhaustive "Histoire des Troubadours" which he leaves unfinished.

Science.

Malaria and Greek History. By W. H. S. Jones; to which is added "The History of Greek Therapeutics and the Malaria Theory," by E. T. Withington. London: Sherrat & Hughes.

In the last five years the Victoria University of Manchester has printed about fifty volumes in several series, as the Manchester University Publications. This handsome volume, No. VIII in the Historical Series, is an effort to amend and enlarge the interesting hypothesis, set forth in an earlier essay, that in the decline of ancient Greece malaria played an important part. Such an explanation of the downfall of great nations, the hypothesis being evidently capable of wider application, throws new light on the perennial problem of the permanence of republics, and obviously has merit in proportion as it is verifiable.

A not inconsiderable part of the book is given up to a general discussion and to an account of the present existence of malaria in Greece. For the rest, the argument is that Greece was probably not malarious in early times—or, at all events, the number of cases was not great—but became so later when the influx of foreigners, including many infected persons, caused an increase of the disease in various fertile districts, as it almost certainly did in Attica in the fifth century B. C.

References to malaria by non-medical writers are lacking or most obscure before the second half of the sixth century, and even then the passage in Theognis is vague, and the evidence of Herodotus concerning Asia Minor for the same period dubious. After this, there is an increase of illness which may have been malaria or its results. At the beginning of the fourth century references to fever were much more frequent. In Thucydides, Xenophon, and Plato, Mr. Jones finds more numerous allusions to fever recognizable as malaria, and the later evidence from Aristotle points to its prevalence. The medical writings are more unsatisfactory because of the difficulty of determining to what extent older authorities are quoted; but the Hippocratic collection is judged to show "that the Greeks of 400 B. C. were perfectly familiar with intermittent fevers, remittent fevers, various pernicious types of malaria, and malarial cachexia." Much space is devoted to a consideration of the effects of these conditions in weakening the people and as a cause of extensive movements of the population into towns, in which, however, malaria may likewise have existed. Extended emigration may also be due to this cause, although Mr. Jones admits that other influences were at work. In fact, when he attempts to make a definite application of his hypothesis, he becomes cautious and seems to feel that he is offering a suggestion rather than a demonstration. Incidentally, the reputation of the Sybarites is reëstablished by the intimation that their apparent effeminacy was merely the extreme caution of a wealthy people—measures of protection rather than of profligacy.

Dr. Withington's essay, of some twenty pages, discusses the pronounced change in therapeutics in the fourth and third centuries B. C., the decline of the Hippocratic method and the development of temple medicine, the loss of the scientific spirit in medicine, and a renewal of the earlier confidence in religion, magic, and empiricism. This change is held to be no longer mysterious, if we accept the prevalence of a disease like malaria which often seems to yield to emotional influences or to some strong impression on the imagination, conditions which we moderns, with our specific treatment of the disease are apt to forget.

In another brief appendix the author attempts to show that the change of view regarding marriage and womanhood, which according to Benecke became evident in the fourth and third centuries B. C., may be explained by the increase in the activity of woman as a nurse when the necessity for such service became greater. This is a matter well worth more extended treatment.

A new series of publications is to be issued through the Putnams as the History of Science, each of the leading branches of science being treated in a volume. The plan is to deal first with the myths or fallacies which preceded the development of the given science, then to supply short biographies of the great men connected with it, and to discuss the social and political conditions which furthered or hindered its progress. Each volume, too, will record important practical applications of the science under consideration, and will contain a bibliography. The first two volumes of the series to appear will be a "History of Astronomy" and a "History of Chemistry," the work, respectively, of George Forbes and Sir Edward Thorpe.

The new volume of the "Atti della Società Italiana per il Progresso delle Scienze" contains the transactions of this society during its sessions at Florence (see the *Nation* for November 19, 1908). The insertion of sixteen full-page plates, reproducing more than seventy of the objects shown at Florence upon whose form, decoration, and associated religious rites Prof. Luigi Milani based his argument in favor of an Asiatic pre-Hellenic origin of the Etruscans, permits those who were unable to be present to judge fairly the line of thought developed in his paper, here printed in full. The earliest Etruscan tombs belong to a

civilization in the first stage of the iron age. What civilization existed in Etruria, while that of the bronze age prevailed among the "lake dwellers" across the Appennines on the lower valley of the Po, is still in doubt. The discussion of Professor Milani's paper was led by Prof. Luigi Pigorini, director of the Museo Kircheriano at Rome, and an authority on the inhabitants of the *Terramare*. Professor Pigorini admitted that, since tombs of the Italiat type, with pozzo, or pit, are found in every Etruscan necropolis, as well as in the Paduan plain, the problem whether there was a continuous evolution in the form of the tombs, or whether there was a sudden change in these forms, caused by the coming of a new people, can only be settled by a systematic and complete exploration of a single Etruscan necropolis. Immediate steps are to be taken to excavate at the point most favorable to the solution of this problem.

Major-Gen. Alfred Elliott Bates, retired, U. S. A., died in New York city October 13, aged sixty-nine years. He was graduated from West Point in 1865, and, after service as an Indian fighter, returned to the military school as an instructor in cavalry tactics. With Gen. Emory Upton he compiled the volume entitled "Cavalry Tactics of 1874." During the Spanish war he was American military attaché at London, and, later, at Paris, where he was created officer of the Legion of Honor. At the time of his retirement in 1904 he was paymaster-general.

The death of Auguste Choisy, French Inspector-general *des ponts et chaussées*, and an officer of the Legion of Honor, has recently been announced. He was for many years professor at the École Polytechnique at Paris, and at the École des Ponts et Chaussées, and a writer on architectural subjects. In 1903 he received the gold medal of the Royal Society of British Architects.

Cesare Lombroso, the Italian criminologist and alienist, died at Turin on October 19. The initiator and promoter of "criminal anthropology" was born in Verona in 1836. After graduation from the University of Turin, he practised medicine and lectured at the University of Pavia on medico-psychology. His publications include: "Pensiero e meteore" (1878); "Sull' incremento del delitto in Italia e sui mezzi per arrestarlo" (1879); "L'amore nei pazzi" (1881); "Omicidio e furto per amore pazzesce" (1883); "Sul mancinismo motorio e sensorio nel sano," etc. (1884); "Lettere politiche e polemiche," etc. (1885); "Delitti di libidine" (1886); "Studi sull' ipnotismo" (1887); "Le nuove conquiste della psichiatria" (1887); "Troppo presto" (1888); "L'uomo di Genio" (1889); "Palimsesti del carcere" (1891); "L'uomo bianco e l'uomo di colore" (1892); "Le piaghe d'Italia" (1893); "L'uomo delinquente" (1895); "La pazzia nei tempi antichi e nei moderni" (1894). These titles are only a few of those which might readily be cited. In recent years Professor Lombroso has made investigations of spiritualism; ultimately being converted from unbelief to an attitude of partial acceptance. In the course of his professional career he held positions as professor of forensic medicine and psychiatry at the University of Turin, and as director of the lunatic asylum at Pesaro. Earlier he had some experience as an army surgeon in the Austro-Italian wars.

Drama.

"The Incomparable Siddons" is the title chosen for Mrs. Clement Parsons's new biography of the actress, to be issued through the Putnams.

Hermann Bernstein, the translator of several of the Russian author's stories and essays, promises an English translation of Andreev's plays, "The Life of Man" and "Anathema."

Once more are we informed that rehearsals of Rostand's "Chantecler" are in progress at the Porte Saint-Martin. The list of interpreters includes Mme. Simone, and MM. Lucien Guitry, Jean Coquelin, Dorival, and Galipaux.

Among the romantic dramas to be produced this season at the Odéon will probably be included Balzac's "l'École des ménages," which has never been produced, or even published. The play was to have been interpreted by Frédérick Lemaître; its refusal by the director of the Renaissance, who preferred the "Alchimiste" of Dumas *père*, was a great disappointment to the author. Only one copy of the "École des ménages" is known to exist: that of Balzac himself, bearing his autograph annotations. This was formerly in the possession of M. Spœlberch de Lovenjoul, who willed it, with the rest of his Balzac collection, to the Institute.

"The Harvest Moon," which was produced in the Garrick Theatre on Monday evening, is in many respects worthy of the reputation of its author, Augustus Thomas. While lacking the romantic and dramatic interest of "The Witching Hour," it has qualities which will commend it to the crowd, as well as to intelligent playgoers. It is a piece with definite philosophic purpose, and although it cannot be accounted altogether satisfactory as a scientific demonstration, it does supply food for thought, and, being written in all seriousness with frequent passages of psychological analysis, is something quite different from the ordinary sentimental or sensational melodrama. In respect of construction it is exceedingly faulty, a number of incidental episodes being loosely strung together upon a very slight thread of dramatic motive. There is far too much talk and too little action, but it should be added that the talk is, as a rule, pertinent and interesting, and often witty. Briefly, the attempt is to show how the life of one woman was destroyed, and how the happiness of her daughter was gravely imperilled by the power of ignorant or malicious suggestion. The mother, divorced through misunderstanding from one husband and legally married to another, dies of a broken heart, when she is wrongfully informed that her second marriage was fraudulent, and her child nameless. The child, out of compassion, is adopted by the first husband, and is made miserable by a malicious spinster, who is always hinting darkly at her mother's worthlessness and the likelihood of her coming to shame in similar fashion. Losing all confidence in herself, and believing herself to be the victim of hereditary taint, the girl exhibits a wilful and capricious temper, and is threatened with complete wreck, when her spiteful aunt reveals to her the hitherto closely concealed facts of her parentage. Fortunately her actual father, the good angel of the piece, is present to disclose his identity, crush the scandal, restore her to happiness and love, and set her on the road to fame. This ending is purely conventional and theatrical, but throughout the play the effect of suggestion and environment upon the character and conduct of the girl is illustrated with admirable invention and dexterity. So far as the specific instance is concerned, Mr. Thomas makes out a good case, but his arguments necessarily fail, when he attempts to enforce a general application from a particular example. His facts are too clearly fashioned to fit into his arguments. It does not follow, as he seems to intimate in one place, that too assiduous warnings against the dangers of strong drink may drive a man into a drunkard's grave. A proneness to hasty generalization is one of his weaknesses. His results are apt to be convenient rather than inevitable. But "The Harvest Moon," in spite of its tendency to substitute theory for fact, and the disproportion between its talk and its action, is a wholesome, interesting, and indisputably clever bit of work, with attractions for all classes of playgoers. The moral deduced from it, by one of the leading characters, that it is the duty of playwrights to deliver an inspiring message, is altogether unexceptionable.

William Vaughn Moody's play, "The Great Divide," which in this country achieved one of the most notable theatrical successes of recent years, has just been published in book form (The Macmillan Co.), and will doubtless find its place in every well-furnished modern dramatic library. It stands the test of careful reading, which would be fatal to the great majority of contemporaneous stage productions. It is a pity that it was not printed earlier, in order that some of the English critics might have had a chance to examine the text before seeing the first representation of the piece upon the London stage. In that case they might have perceived in it the literary quality, the deeper meaning, and the intelligent purpose which distinguish it from the class of ordinary wild Western melodrama in which they seek to include it. That it is, especially in the opening scene—so far as the main outlines of its action are concerned—essentially melodramatic, need not be disputed. The same point might be made with reference to many of the noblest tragedies in existence. It may be admitted also that its psychological developments are not in all respects conclusive, or convincing. The true value of the piece lies in the dialogue, which is always simple, natural, compact, significant, and characteristic; in its effort to portray the effect of environment upon character, and the interaction upon each other of originally kindred natures—a woman trained in all the refinements and prejudices of Eastern culture, and a man left to follow his baser impulses in the wilder regions of the West—when thrown together under circumstances where the woman has only her cultivation to defend her against the lawless force of the stronger. Whether or not Mr. Moody's solution of the particular dramatic problem which he set himself is altogether in accordance with probability is not a matter of prime importance. The philosophy of the play, in its broader application, is sound, as the allegorical illustration of it is interesting. In London only the melodramatic externals attracted much attention.

Dr. Wallace's recent Shakespearean discoveries are largely discounted by Sidney Lee in a letter to the London *Times*. Mr. Lee holds that Dr. Wallace has greatly exaggerated the value of his finds, and that the single original document which has been brought forward is the *ex parte* statement of a plaintiff in a suit, unconfirmed by the testimony of witnesses or the findings of a court. The document in the case is the plea of Thomasina Ostler against her father John Hemyngs, in the matter of certain shares in the Globe and Blackfriars Theatres, of which the estimated value is given. "Daughters," says Mr. Lee, "when quarrelling with their fathers over money matters, have been known to misrepresent and exaggerate the value and nature of their claims." And he might have cited in support the celebrated case of Goneril and Regan. The real value of Dr. Wallace's work Mr. Lee sees in the fact that it calls attention once more to the vast stores of unexplored Elizabethan material in court registers, public archives, and private collections, which might be made to yield precious discoveries. The work is tedious, and, for long stretches, barren of results. In nature it is like digging for radium, but Mr. Lee believes that an investment of fifteen or twenty thousand dollars a year would keep ten capable investigators in the field. Here, indeed, is a chance for immortality offering itself cheap to some wealthy brewer or pork-magnate. The endowing of a fair-sized university cannot yield anything like the fame which would come to a name tied up with a new date or a new reading in Shakespeare.

Music.

A REGRETTABLE TENDENCY IN SONG RECITALS.

For some years the custom was observed of not giving any serious concerts or song recitals in New York until the first of November. Last year, David Bispham broke this rule, and again this year. Several singers have followed his example, while others have announced their intention of doing so. Doubtless this is due largely to the steady encroachments of grand opera. Formerly we had opera only three or four days in the week. This year the Tuesdays and Thursdays also will be "operized," to use a word coined by Oscar Hammerstein. What is left for the concert-givers unless they fall back on October, when there is no opera?

No one has any particular reason to regret this tendency except the concert-givers themselves, whose audiences are not likely to be quite so large in October as later in the season. But there is another tendency in our concert halls, which calls for emphatic disapproval. It is the outgrowth of a virtue. Until a few years ago, nearly all the singers revealed little more than the musical side of the songs they selected. To the poems they gave even less consideration than opera singers gave to their librettos previous to the Wagnerian era. Presently some of the composers began to write songs in which the music played second—sometimes twenty-second—fiddle to the poem. The singers tried them, and lo, the audiences applauded wildly, for they liked the poems, and the slender music did not worry them.

This species of song is composed and produced more and more frequently, and one feels like asking what is to become of music, of melody, if this continues? David Bispham is one of the chief culprits; he sings things like "Danny Deever," Walter Damrosch's cheap setting of Kipling's poem, on every possible occasion, with other "songs" of that description; and the audience roars with delight. Wetzler, Homer, and others in this country have written such songs. Not that they originated them. They were started abroad. Richard Strauss and Hugo Wolf are among the perpetrators, and Dr. Ludwig Wüllner, one regrets to say, is among those who sing them. At his Carnegie Hall recital last Saturday, he produced Hugo Wolf's "Der Feuerreiter," to a lurid poem by Mörike about a burning mill, with a mysterious rider and a skeleton found in the cellar. Wolf's music, regarded as music, is absolutely empty of content, yet, with his rare declamatory art, Dr. Wüllner made his rendering effective. Now this wonderful artist has been highly commended heretofore for showing that the very best songs are none too good for the public, provided they are interpreted with adequate art and eloquence. There are plenty of first-class songs in which the poem and the music are equally good. Why not sing and declaim those? Is music to be excluded entirely from our concert halls?

Hardly a recital is given now without several of these songs, in which the music is inane or superfluous. George Hamlin, a good tenor, had on his Carnegie Hall programme last Sunday a group of old English lyrics which were not improved by the music added to them by Roger Quilter. Still, they were not examples of the extreme tendency referred to—a tendency which, if persevered in, will degrade the art song to the level of the melodrama, in the sense of a dramatic piece in which the plot is of infinitely more importance than the music. Must the pendulum swing quite so far as that before melody and musical ideas again come to their own through a reaction?

Elise Polko's "Musical Sketches" are announced in an enlarged and illustrated edition by the Sturgis & Walton Co. The new edition is to include sketches never before Englished.

A distinguished collaboration finds expression in the opera, "Le Mariage de Télémaque," of which rehearsals are now beginning at the Opéra Comique; the music is that of Claude Terrasse, the libretto the joint product of MM. Lemaître and Donnay, of the Académie Française.

That great music is often allied with great poems is proved by the "Gems of German Song," a revised version of which is issued by the Oliver Ditson Company. The collection is made with taste and a regard for variety of style. It includes gems by Schubert, Schumann, Franz, Jensen, Liszt, Rubinstein, Brahms, Tchaikovsky, and seventeen other masters. The collection of "Sacred Songs" contains compositions by twenty-six writers, of whom Gounod is the most famous and original. The same firm has also issued a serviceable vocal score of Handel's "Messiah," carefully edited by Dr. Percy Goetschius, whose aim has been to eliminate all errors and additions that have crept into other editions, and not to alter or omit a single note of Handel's original score.

Sir Hubert H. Parry, formerly professor of music at the University of Oxford, is the author of a life of Johann Sebastian Bach, which the Putnams will soon publish. This work is a more condensed survey of Bach's life work, and of his unique artistic character than that of Philip Spitta.

Art.

EL GRECO.

I.

After nearly three centuries of neglect, varied only by dispraise, the Cretan wanderer Domenico Theotocopuli has been reborn into fame. Artists particularly make a cult of him. Museums pay the prices of a Velasquez for his pictures, which only a generation ago passed for the product of a diseased mind. Criticism deals with him in the most serious way. Two years ago, we had the remarkable biography of Señor Cossio, and recently a convenient monograph by Messrs. Calvert and Hartley.*

Note, however, that painters first made the fame of this great visionary. Unlike other revivals, the Greco cult has not been preached *in partibus* by the middlemen of art; it has grown among the studios of Paris and London, whence it has spread widely. Now all popularity implies a preparedness in the public, but equally it implies a propagandist or a group of champions. We talk as if the vogue of painter, novelist, or playwright simply grew. Instead, it is made, per-

**El Greco: An Account of his Life and Works*, by Albert F. Calvert and C. Gasquoine Hartley, is the latest addition to Mr. John Lane's Spanish Series. The moody Cretan has become a shibboleth with our ultra modern painters, so one opens such a volume with awakened expectations. But only disappointment lies, we fear, in the average reader's way. In fine this book is a conscientious but wholly uninspired compilation, negligible as criticism, but useful as a collection of facts not readily accessible in English. It lacks a few pictures, mostly in American collections, but nothing of great importance except the Last Supper in the Loeser Collection, Florence (with a smaller version in the Johnson Collection, Philadelphia), which is perhaps the earliest extant work of the master. There are one hundred and thirty-five good half-tone cuts.

haps, by a single seasonable word of one influential person. Mr. X, the present incumbent of the literary pontificate, tells Mesdames Y and Z over the ortolans that A's first novel reveals genius. The fundamental fact of a popularity is always the same. Somebody feels an enthusiasm and tells somebody else. I often think how much more vivid would be the annals of art if we but knew the real fathers of the great enthusiasms. There was, perhaps still lives, an obscure individual, who casually told Ruskin about Tintoretto. Somebody undoubtedly first mentioned Greco admiringly, and in recent years. I merely suggest that the studios began to hum with this new sensation about a dozen years ago when John Sargent, then planning the Christian subjects in the Boston Public Library, had returned from a prolonged visit to Spain.

But whether it was Mr. Sargent or another who first gave the impulse, somebody would have done it. We were ready for Greco. The rationalizing methods in art and letters seemed to have played out. Men had discovered that there was no salvation in the spots of Manet, nor yet in the dots of Monet. The older realism of Courbet had run its course, with the Rougon-Macquart of Zola. After Taine and his methodology, the impressionism of Jules Lemaître and Anatole France was giving the tone to criticism. In painting temperament was coming to be the most treasured quality. Too much of it there could not be. One yielded to the hieratic lusciousness of Gustave Moreau. The morbid precocities of Aubrey Beardsley were winning international repute. The wisest of dreamers, Puvis, was still active. Burne-Jones's fairyland had not reached its ultimate contour. Resurgent romanticism—a more feverish and disillusioned type than the old—required its own. And no painter of the past was more emphatically its own than the sombre Cretan who filled Toledo with visions of nightmare and ecstacy during the years when Cervantes was writing "Don Quixote."

II.

The record of Greco's life is scanty, yet on the whole illuminating. We meet him first in a letter of the Croatian miniaturist, Giulio Clovio. Writing in the late autumn of 1570, he begs Cardinal Farnese to give temporary lodging at Rome to an able young Candiote painter, a pupil of Titian. The Cardinal presumably accorded a more substantial patronage, for several of the earlier pictures are traceable to the Farnese collection. What chance called Domenico to Toledo and the service of His Most Catholic Majesty we do not know. By 1577, however, the stranger had completed an important picture, The Assumption, now wandered to Chicago, for the Church of Santo Domingo el Antiguo. Two years later he had completed for the cathedral the famous masterpiece entitled The Stripping of Christ (El Expolio), and was engaged in a litigation over the pay. During the trial he declined to tell why he had come to Spain, and though he must have been at least four years already in Toledo, declared that he did not understand Spanish and requested the services of an interpreter. The incident tells that his life had been a solitary one. In 1580 he received from Philip II a commission to paint for the chapel of the Escurial a Martyrdom of St. Maurice. This picture, the first that reveals the true Greco, was the subject of various disputes, and finally gave so little satisfaction that it was denied its position in the chapel and relegated to the chapter hall. His own Toledo at least supported him loyally. The Toledo where Jew and Heretic still roasted at the stake to the edification of Christian eyes and noses, knew how to appreciate the flame-like ecstasy of his brush. For nearly forty years he labored there. Not merely painting, but sculpture and the designing of architectural altar-backs, enlisted his energies. Pacheco visited the old man in 1611 and reports him as of philosophical bent, a writer on art, an inventor of witty sayings. He adds the really important information that he saw clay models for every picture Greco had painted. This shows that the distorted and exaggerated anatomy of Greco's figures was not due to careless improvisation, but was based on deliberate choice.* In 1614 he died intestate, comforted by the sacraments, and was buried in Santo Domingo el Antiguo, where time has effaced his epitaph.

From various scattered intimations it seems to me, we glimpse a personality. The contours perhaps are vague, as they are in Greco's own creations, but as in these, the emotional bias is unmistakable. An inordinate professional pride, a litigious bent, a dread of society, with a craving for luxury and suave sensations, a brooding philosophical disposition commanding eloquent words—here are the familiar traits of the superman. The profound melancholy that accompanied these capacities is written a hundred times with singularly unvarying lineaments in those portraits in which through the features of his patrons he celebrated the dignity of his own spleen. Pride, sensitiveness, inwardness—this equipment made him an ideal interpreter of the Spain of Philip II. They thought Greco mad, and perhaps they were partly right. No perfectly normal person could have lived himself so unreservedly into the religious ardors and ecstasies of the Spain of Teresa of Avila.

*Greco may have borrowed this practice from Tintoretto, who set up his compositions in wax models.

III.

But the story of the man is better surmised from his works than from documents and notebooks. Born in Candia, his first impressions of painting, and perhaps his first practice of the art, must have been limited by the Byzantine decadence. Yet there were strange stirrings within the body of that death. The Greek painters who lived along the Venetian trade routes had in excellent prints the compositions of Tintoretto and Michelangelo. Within the hieratic limitations of gold background, prescribed color, and calliographic modelling and drapery, some of them tried to emulate the grand style that they glimpsed from afar. No great pictures came of the endeavor. But I know few works more strangely piquant than certain of the sixteenth-century panels in which insular artists undertook to write back Michelangelo into the immemorial formulas of Byzantium. This was the art that first influenced Domenico, and, curiously enough, his own fully developed formula in Spain, with its contempt for reality and strong decorative intention, resembles more strikingly this perturbed form of Byzantinism than it does the Venetian painting in which he was actually schooled.

To have been a painter of repute in 1570, as Giulio Clovio assures us Greco was, implies several years of tutelage. Tintoretto, we are told, was the real model for the young painter, even if Titian was the titular master. This may be—the early Grecos have been easily confused with both Tintoretto and Bassano—but I fear the disclaimer rests upon the inveterate tendency to regard Titian chiefly as the author of Sacred and Profane Love, the Man with the Glove, the Flora, the Assumption, and the Pesaro Madonna. Nothing is stranger than the conspiracy of criticism to pass lightly over Titian's mature and most characteristic work. As a matter of fact, by 1565, when, roughly speaking, we may suppose Greco came to Venice, Titian was passing into his ultimate tragic phase. The old patient, beautiful methods of building up a picture in successive over-paintings and glazings, he had largely disused in favor of more direct, drastic, and expressive methods. The old full harmonies of crimson, blue, green, and umber, had given way to a general sombre tonality, varied by rich color, sparsely applied, and by flashes of cold light athwart the darkness. When we think of the Titian that aided Greco, we must summon up, not the creator of the Giorgionesque poesies, but the painter of the St. Jerome of the Brera, the Flagellation of the Louvre, the equestrian Charles V of the Prado. Technically, and spiritually, the affinity between master and pupil is so close at this time that we need not emphasize extraneous influences.

What Greco did in the Venetian manner requires, however, but passing attention. His earliest work, which has escaped the biographers, is a Last Supper in the collection of Mr. Charles Loeser, Florence. A similar replica is at Philadelphia in the Johnson collection. Here we find the careful, rather inexpressive work of a beginner. In Christ Healing the Paralytic, in the Scourging of the Money Changers from the Temple, pictures which exist in many versions, and in the Adoration of the Kings at Vienna, the real man begins to appear. If, on first glance, these canvases associate themselves with Titian, Tintoretto, and Bassano, a closer inspection reveals a more exaggerated elongation of the figures, notably small heads, a characteristic wildness in expression, a studied contortion of pose, with keener passages of crimson and green, than the current Venetian practice tolerated. These traits are not insistent or sensational. Without the Toledo pictures, the slight peculiarities of these early works would probably escape us. We have lost Greco's own portrait which Clovio assures us excited the admiration of artistic Rome, but Naples still keeps the fine likeness of Clovio himself, a sound product of the Venetian school, and the odd allegory "Man Is Fire, Woman Tow." The point to note in this not very admirable student work is that Greco had mastered the technic of Venice, and could readily have made of himself a second rate Venetian master. Such perhaps might have been his lot, had not some chance unknown to us taken him to Spain, withdrawn him from the criticism of his peers and even from the sight of fine Italian painting.

IV.

In swarming, gray Toledo, set high within its river loop, still ruled by the savage, gloomy, or ecstatic passions of the Middle Ages, there had been no revival of learning, no liberation of the human spirit; the tolerant Moors themselves had in the main merely provided material for religious fanaticism to work upon. Life was passed in the expectation of the miraculous. Hardly beyond the memory of the grandparents of very old people, St. Stephen and St. Augustine had come down from heaven to lay the pious count, Don Gonzalo Ruiz of Orgaz in his tomb in Santo Tomè. The sense of sin was oppressively strong. But for the blood of Christ and the martyrs guaranteeing the future, life would be one long intolerable terror. Here was a world of mysticism that still lacked its painter, and then came the Greek to appal and ravish the eye.

Yet even in remote Toledo, Venice was not easily to be renounced. Greco's first Spanish picture, the Assumption of the Virgin, is obviously based on Titian's masterpiece. Its rhetorical quality is the same. What is new and original is the drastic half-realistic treatment of the heads of the apostles and those adult angels transcribed from magnificent Castilian women with whom, in rather Oriental fashion, Greco continued to people his heavens. They are in some fashion his most original and gracious contribution to art. Their lithe and powerful figures never suffer the distortions that his saints undergo. They are the elder sisters of Velasquez's Venus. In many pictures they are the single element of materiality. The man who created them was undoubtedly a mystic, but at the bottom of his heart he assuredly was no ascetic. Indeed, one may say of the asceticism of Spain itself that it was like an anchorite who had by strange chance or instinctive design chosen his cave on the haunted steeps of Venusberg. The more famous Stripping of Christ, which is still in the Cathedral of Toledo, is again highly Venetian in its elements. All the forms, I think, even the over-praised Three Marys, could be paralleled in the school of Titian. Remarkable in this picture is its visionary detachment. No locality is indicated or needed. A menacing throng presses out of the gloom about the patient figure of Christ. This restless mass is balanced by the quiet group of the Marys and the workman who bends statuesquely as he bores a hole in the cross. Threatening hands surge out into the torchlight; the bodies to which they belong shimmer uncertainly in the shadow. The scene is a densely peopled no-man's land, where light and darkness contend. It is inhabited not by palpable forms, but by passions. This renunciation of realistic setting is crucial for Greco. In his early pictures we find substantial architecture, and landscape; now simply portentous folk plucked from surrounding darkness by shafts of spectral light. This formula brings Greco into strange associations. Spiritually, it allies him with Rembrandt, whose figures tend to become an incandescence within a luminous darkness. But here the chiaroscuro, while a potent means of expression, remains as well a sound and effective means of representation. Rembrandt's mystery is in essence a sublimated reality. In Greco, on the contrary, representation is soon left far behind. The chiaroscuro becomes a dissolvent, the figures flutter in the light like vapors, the limbs swell or bend as if composed of half-fused metal, the hands—frequently foreshortened—flicker like fronds blown in the wind. In the St. Maurice of the Escurial and the Entombment of the Count of Orgaz we have merely the first symptoms of such deliquescence. In The Adoration of the Shepherds of the Metropolitan Museum the process is complete. The triumph of this method we find in the Baptism, and Resurrection of the Prado, or, better yet, in the Vision of St. John in the Zuloaga collection.

It was the element of excess in the man that made him famous. If he thought his pictures beyond price, it was because no others proclaimed so emphatically the tragic contest of heaven for the possession of the human soul, and is it not this quality in his painting that commends it to the modern artist? The lambent movement of his compositions is an innovation and a piquant one. His world is interfused with a light all its own. At bottom what most of the great technicians have created is a fashion of lighting. The sulphurous reek of Tintoretto, the serene blue of Veronese, the amber obscurity of Rembrandt, the flushed mother of pearl of Tiepolo, the steely irradiation of Velasquez—these are what painters chiefly prize. The effects of an artist are determined by his conception of light. His act of creation is merely a *fiat lux*—he illumines a thing seen with the inner eye. The worst thing we can say of him is that his eye is darkness, creates no light of its own, cravenly accepts an alien or prescribed luminosity. No such reproach lies against Greco. He fills his canvases with a peculiar ashen radiance—Mr. Charles S. Ricketts, in his book on the Prado, has noted justly its charnel suggestion—that plays upon the underlying blackness in the most diverse fashion. The modulation of this pallor is Greco's secret. It bursts violently above his figures like a moon searching the rifts in a cloud; it falls in palpable rays as from a reflector; it flickers through the dark corners of the picture, moves tenderly upon upturned faces, settles steadily upon outstretched and almost translucent fingers, is drunk up by masses of moss green or glowing crimson stuff. Something theatrical there is in this, and something immensely able. Because Greco wrought so craftily with light itself as if there were no intervening pigment, because he contrived such various effects out of a single formula—a mass of rich color set below a subtile weaving of shadow with pallid light—because of these purely technical qualities Greco passes for a great artist in an age when light is king.

V.

We have seen why the modern artist usually admires Greco, and if the above analysis of his religious painting be correct, why, the man of taste cannot afford to dismiss him merely as a bad draughtsman. Greco knew what he was about. The element of excess and self-hypnosis was deliberately cultivated. We cannot well like him in spite of it. It is of the essence of his art. We may then at least test ourselves by asking which pictures we like best, those in which the emotion has assumed strange yet not abnormal forms, or those in which the dissolvent process is complete—concretely, do you care most for the Burial of Count Orgaz and the Martyrdom of St. Maurice, or for The Vision of St.

John and the various Baptisms? And this is a very personal question, for it comes to saying "Do you like him most when most himself, or when his passionate spirit is tempered by reflection on his theme and respect for the traditions of his craft?" In simple frankness I am bound to say that I remember best and could least spare the Burial of the Count of Orgaz. That great and unforgetable picture seems to me to contain at their height all of Greco's most valuable qualities.

St. Stephen and St. Augustine in magnificent vestments have come down from heaven to lay the body of good Don Gonzalo in its grave. It is the moment after their intervention. The celestial officiants bend tenderly over the mailed body, which lies, not stiff, like a corpse, but flexed in their arms, with the head falling sideways like that of one in a swoon. At the left one Capuchin friar points out the miracle to another. At the right a deacon gazes into the heavenly radiance above, while an unseeing priest continues to read the service for the dead. The gold embroideries of the saints and the priest—especially a superb moss green mantle—afford a sonorous contrast with the bluish reflections of the armor and the silvery sheen of the deacon's gauzy surplice. Between these flanking foreground figures stretches a row of solemn heads above white ruffs and black doublets—the mourners. Some gaze ecstatically into the opened heaven, their large eyeballs rolled high into cavernous sockets. Others, with a gentler sentiment, keep their eyes fixed on the dead man; a few maintain the impassive attitude of firm men yielding neither to grief nor surprise. The only overt indication of either emotion is three of those diaphanous hands waving flower-like before the steady mass of black breasts and shoulders. I can conceive nothing more poignantly self-contained, nothing more magnificently correct, nothing more completely Spanish. Above this file of mourners, and seemingly poised on the flames of torches right and left in the background, is heaven itself occupying the semi-circular top of the great canvas. There are permitted the gestures forbidden to knightly folk here below. Balanced on clouds, Christ reaches down in benediction to the Holy Virgin and the gaunt Baptist. Three strong-winged, cloud-compelling angels attend the group. Through rifts are seen the congregations of the saved ranged in their hieratic circles. The clouds are effulgent with the half-seen faces of the cherubim. All heads strain forward in adoration, the whole mass surges with light and motion.

Those persons who expect from art the stab that life itself deals in spiritual emergencies, will prefer Greco in his most undisciplined mood. I have no such expectation or desire. For me the sense of beauty admits all manner of excitement, but always an excitement contained within an enfolding serenity. Within limits many degrees of keen emotional experience are possible. But the moment the sheer excitement perturbs the serenity, the impression of art is tottering; the moment it prevails the sensation is no longer of art at all. Contrariwise, when the excitement departs the serenity becomes void of content—a complacency splendidly null. If this be true, the sense of beauty is akin to the feelings that we have at moments of greatest physical and mental efficiency. The orator riding the storm against hostile hearers knows the calm of throbbing nerves, and that, I take it, is the serenity of art. Thus every impression of art must end well in the sense of leaving us calmed and fortified—the meaning, I take it, of the much discussed term of Aristotle, *katharsis*.

VI.

If we measure Greco by this standard, we shall find him, save in a very few pictures, wanting. Through him we rarely win to serenity of any sort. He dismisses us amazed and troubled. He is called a great portrait painter. There could, I think, be no greater error, and yet few artists have painted more moving and impressive portraits. But these scores of likenesses come down to a single character. Always the haggard face, narrow forehead, uneasily rolling eye under sockets sharply arched—always an overt melancholy silently appealing for sympathy. The technical ability in many of these stern effigies is prodigious. Besides, these faces haunt one. Yet we remember merely a kind of composite of them all. A single ghost would fairly represent the portraiture of Greco, while the persons that one recalls casually from, say, Titian, Holbein, Velasquez, Bronzino, constitute a varied world. In exacting the last jot of wonder, Greco was something more or less than Spanish. It has frequently been said that he is more Spanish than the Spaniards, and in the sense of rejecting the reserve that veils their ardent emotional life this is justly observed. No one has expressed the ferocious ecstasy of Loyola's Spain so completely. But no Spaniard, I take it, would regard so reckless an exposure as quite dignified. Zurburan remains, after all, the finest and truest representative of the Spanish soul in post-Reformation travail.

I have suggested that there may have been in Greco some deliberate cultivation of the ecstatic mood, some rather conscious resort to self-hypnosis The fact that in his old age he returned to his quieter and more concrete manner—in the lovely St. Martin of San José and the Assumption of San Vincente, for example—suggests that his wilder manner may have been not quite spontaneous. At any rate, he was not its victim. When it pleased him that his pictures should no longer recall the melting-pot they readily regained substance and stability. There probably was about him some such element of mystification as we find in a Salvator Rosa or a Whistler. We must take such people only a trifle more seriously than they take themselves. From a sardonic or a wholly vehement person the finest art cannot come.

We must not expect it in Greco. But the art that misses equilibrium is by no means valueless. If we enhance ourselves most vitally through the art that has achieved a passionate serenity, we at least enrich our experience through the art which has missed its bounds. The cry of overstrung nerves and temperament is not uttered in vain when the sufferer is large enough to find in himself the aspiration, or the agony of many men. Certain pedants have written as if the world would be better without its disorderly geniuses. There could, I think, be no sorer error. We need the unbalanced talents, the *poètes damnés* of every craft. They strew the passions that enrich a lordlier art than their own. They fight valiantly, a little at the expense of their fame, against the only unpardonable sins, stupidity and indifference. Greco should always be an honored name in this ill-destined company. Nay, at times, he escapes them, and hovers uncertainly near the elect body of the greatest artists.

FRANK JEWETT MATHER, JR.

Capri, Italy.

Charles H. Caffin has written in "The Story of Dutch Painting," which is to be issued this month by the Century Company a book likely to interest both adult students of art and wide-awake girls and boys. It is to have twenty-five halftone reproductions of notable Dutch canvases.

Russell Sturgis's "History of Architecture" is to be completed by Arthur L. Frothingham, formerly of the Princeton faculty. The first volume of this work has been published; the second will appear about November 1. The third and concluding volume will be Mr. Frothingham's own work, and will not be published before the autumn of 1910. (Baker & Taylor.)

The Prix Chaudesaignes has been awarded by the Académie des Beaux-Arts to M Costel, a pupil of Louis Bernier. This *bourse* consists of two annual grants of two thousand francs, with which the young architect honored by the award is enabled to pursue his studies in Italy.

The seventh annual water color exhibition of the Pennsylvania Academy of the Fine Arts will be held at the Academy, beginning November 8, and closing December 19. The Beck prize of one hundred dollars is offered for the best work exhibited that has been reproduced in color for the purpose of publication. Original work in water color, black and white, pastel, or drawing with pencil, crayon, or pen, or illustra-

tions in whatever medium, will be examined by a jury consisting of Thomas P. Anschultz, Albert L. Groll, Blanche Dillaye, James R. Hopkins, G. W. Dawson, and W H. Holmes.

Twelve years have elapsed since the Goethe Museum in Frankfort was opened as a kind of annex to the Goethe Haus, and in the meantime the library has grown to 40,000 volumes, together with a precious collection of manuscripts and drawings. Now it has been decided to supersede the unstable structure with two fine, fireproof edifices in the style prevailing in Frankfort in 1790, to be erected in the Grossen Hirschgraben and the Salzhaus, adjoining the birthplace of the poet.

The monument to Heinrich Heine by Hasselrijs, placed by the Empress of Austria in the Achilleion, in Corfu, seems fated to become as historic in its wanderings as some of the fabled heroes of old. The Kaiser disposed of it with a snap of his fingers, and there was nothing left for the Oberhofmarschallamt S. M. to do but to sell it to the highest bidder. Julius Campe, a quasi relative of the poet, secured control of the effigy, and straightway offered it to the city of Hamburg, promising to erect it on an imposing pedestal, provided a conspicuous place were given it in one of the public squares. Now the august *Senat* of the old Hanseatic city has refused Herr Campe's offer, remarking that a Heine Denkmal in daily sight of Hamburgians would be offensive! As a possible way out of the difficulty, the city fathers suggest the placing of the rejected masterpiece "in some corner of the Botanical Garden where it will enjoy a quiet background."

Francis Lathrop, an American mural painter, died at Woodcliff Lake, N. J., on October 18, in the sixty-first year of his life. He was born at sea, near the Hawaiian Islands; received his education, in part, at Dresden, and studied painting in London under Burne-Jones and Madox Brown, returning to this country in 1873.

Prof. Richard Engelmann, the archæologist, has died at Graz, in his sixty-fifth year. He was the author of "Bilderatlas zu Homer," "Pompeji," and other works.

Finance.

AFTER THE HARRIMAN RÉGIME.

A month ago, when the Union Pacific directors voted to replace on the board the late E. H. Harriman and the late H. H. Rogers by Jacob H. Schiff and William Rockefeller—both of them Harriman's old associates—and chose as chairman of the board Mr. Harriman's friend, Judge Lovett, the popular Wall Street theory of a contest for control between the "Morgan party" and what is left of the "Harriman party" received a quietus. Believers in that theory remarked sagaciously, however, "Wait till the shareholders' annual meeting on October 12"; and, in fact, there was a considerable body of opinion, on Wall Street, to the effect that the contest was only postponed until that strategic date. Even financial London listened to the interesting story that, at the October meeting, J. P. Morgan's son would become the chief of Union Pacific. The meeting occurred at Salt Lake City on Tuesday of last week, and the directors' action of September 13 was quietly approved.

But this was only one company out of the forty-one in which Harriman sat on the directors' board. There was the Erie, for example, which Harriman last year rescued from bankruptcy when the Morgan interests were about to let it go; the Illinois Central, which Harriman snatched from Stuyvesant Fish in 1907; the New York Central, whose stock he bought with Union Pacific money, and in which he was thought to be crowding out the Vanderbilts; the Wells-Fargo Express, where revolt against Harriman by shareholders, a couple of years ago, evoked from Nelson Cromwell the soothing assurance that Harriman "moves in a world into which we may not enter"; the Gould roads, where Harriman was about to become the guiding force. What was to happen in these boards?

Most of them have not yet acted on replacing Harriman. Last week, however, his vacant chair was filled at the New York Central board by Marvin Hughitt, generally classed as a Vanderbilt man. This was a blow to the market's theories of a "Harriman coup." Outside of the National City Bank, where last month Harriman's place was filled by J. P. Morgan, jr., three other corporations have acted in the matter. The Baltimore and Ohio Railway, where Union Pacific influence was powerful, has chosen Judge Lovett, who succeeded Harriman in the Union Pacific, to succeed him on its board also. In the Pacific Coast company, John I. Waterbury, hardly a Harriman ally, replaced him; in the Western Union board, Harriman and the late Gen. Eckert were succeeded by Mr. George Gould's son Kingdon and by E. T. Jeffrey, one of Harriman's old antagonists.

These are somewhat mixed results, and they left the Erie and Illinois Central changes undecided. What has already happened indicates that, in at least some quarters, "Harriman control" was lost when Harriman was himself no longer there.

There could not very well have been any other result. The extraordinary power and influence wielded by that remarkable man were derived, in perhaps fairly equal measure, from his individual force and prestige and from his dictatorial use of the Union Pacific's surplus funds to buy into other railway properties. Neither basis for a continued financial hegemony of the sort remains. Harriman himself, with the aggressive personality which used to overawe fellow-directors, and force a "Harriman policy" to a vote even on a hostile board, has gone. Union Pacific's treasury still contains huge blocks of shares in other railway enterprises; but all accounts agree that many of these have been quietly sold in the past few months, and the signs of the times indicate that, before very long, the railway company itself must part with the rest of them and confine itself thenceforward to its legitimate railway business.

What may be called the disintegration of the Harriman group of railways under a single personal control is altogether a wholesome tendency of the day. People who study fundamental causes, will recognize that the Union Pacific $131,000,000 purchases of railway stock in 1906, under the Harriman régime, was only a second phase of the effort of selfish and powerful financiers to get the country's whole railway system into their personal grasp. The first scheme was the enterprise of the Northern Securities holding company, against which Supreme Court Justice Brewer cast his deciding vote in 1904, on the ground that the device "might be extended until a single corporation, whose stock was owned by three or four parties, would be in practical control of the whole transportation system of the country." That scheme the courts of law have blocked. The next expedient was the use, by one bold financier, of a single railway's credit to buy control of all the other railways. To this the panic of 1907 and the death of Harriman have put at least a temporary end.

2nd printing of

Fifty Years of Darwinism

8vo, 274 pp. $2.00 net; by mail, $2.16.

Addresses in honor of Charles Darwin delivered January, 1909, before the American Association for the Advancement of Science. By Edward B. Poulton (Oxford), and the following Americans: John M. Coulter, David Starr Jordan, Edmund B. Wilson, D. T. MacDougal, W. E. Castle, Chas. B. Davenport, Carl H. Eigenmann, Henry Fairfield Osborn, G. Stanley Hall, with an Introduction by T. C. Chamberlin.

Nation: "Truly a wide range of subject and opinion; a fine tribute to the memory of a great and independent thinker."

4th printing of

Kellogg's Darwinism To-day

By VERNON KELLOGG, Professor in Stanford University. 395 pp. 8vo. $2.00 net; by mail, $2.16.

President David Starr Jordan in *The Dial*: "Its value cannot be over-estimated. A book the student must have at hand at all times, and it takes the place of a whole library. No other writer has attempted to gather together the scattered literature of this vast subject, and none has subjected this literature to such uniformly trenchant and uniformly kindly criticism. An investigator of the first rank, and master of a clear and forceful literary style."

2nd printing of

Locy's Biology and Its Makers

By WILLIAM A. LOCY, Professor in Northwestern University. 460 pp. 8vo. $2.75 net; by mail, $2.88.

An untechnical account of the rise and progress of biology; written around the lives of the great leaders, with 123 illustrations.

Dial: "It is entertainingly written, and better than any other existing single work in any language, gives the laymau a clear idea of the scope and development of the broad science of biology."

***Circulars of these books on application.

HENRY HOLT & CO., 34 W. 33d St.

An American Transportation System

A Criticism of the Past and the Present, and a Plan for the Future.

By George A. Rankin *$1.50 net.*

This volume is based firmly upon a foundation of practical knowledge, the best statistics, and a thorough acquaintance with the literature of its subject. It should have a profound effect upon the railway problem, which in this country is one of peculiar difficulty and complexity.

Burlingame Public Library

THE "CHILD'S GUIDE" SERIES

THE cordial reception accorded to the titles already published has encouraged us in our effort to provide an educational series at once readable and instructive, and adapted not only to the juvenile mind but also to the riper intellect of the adult who may wish to learn as he teaches.

A Child's Guide to American History

By HENRY W. ELSON

350 pages. 12mo. 16 illustrations. $1.25 net, postage 12c.

The author of Elson's "History of the United States" contributes a volume of much importance to the "Child's Guide" Series. This carefully prepared work provides a manual which will come to be recognized as an invaluable aid to the youthful students of American History. No movement of importance is ignored, though necessarily the treatment is along broad lines. The resulting volume is one of interest and importance.

PREVIOUSLY PUBLISHED.

A Child's Guide to Pictures

By CHARLES H. CAFFIN

A Child's Guide to Mythology

By HELEN A. CLARKE

The books are attractively bound in red cloth, with gold stamping and half-tone cover inserts, and the illustrations will be found notably interesting. Sold at a uniform price of $1.25 net; postage, 12 cents additional.

The Nation.

NEW YORK, THURSDAY, OCTOBER 28, 1909.

The Week.

President Taft uses no more emphasis than the case calls for when he declares his absolute opposition to any application of the "pork-barrel" idea to the great sums of money in contemplation for waterways improvement. The log-rolling methods that have heretofore governed in the annual appropriations for rivers and harbors were bad enough when the money had to come out of revenue from current taxation; if anything of the same kind were permitted when the money is raised upon long-time bonds the result would be utterly intolerable. And it is not only the piecemeal log-rolling as between Chicago and St. Louis, or Duluth and New Orleans, that the President objects to. He takes hold of the thing at its beginning, in the proposal to divide the prospective fund between the great sections of the country. "There is a proposition," he says, "that we issue $500,000,000 or $1,000,000,000 of bonds for waterways and then that we just apportion part to the Mississippi and part to the Atlantic, a part to the Missouri and a part to the Ohio. I am opposed to it. I am opposed to it because it not only smells of the pork barrel, but it will be the pork barrel itself. Let every project stand on its own bottom." That is sound doctrine; but nobody knows better than Mr. Taft himself how difficult it will be to devise a method for effectively putting it into practice.

The small proportion of the negro vote in Maryland—one-fifth of the total—is not the only thing that distinguishes the movement for a disfranchising amendment in that State from the like movements in the States further South. In these latter States, negro suffrage was indissolubly connected in the public mind with the corruption and misgovernment of the carpet-bag régime of the years following the civil war; in Maryland, on the contrary, the fight for a fair count of the negro vote was the very centre of the struggle to throw off the long domination of the Gorman-Rasin ring, which, for more than twenty years, held the State and the city of Baltimore in an iron grasp. The foremost leader of the fight for fair elections was Severn Teackle Wallis, the most distinguished member of the Baltimore bar, a man who had suffered imprisonment during the war on account of his Southern sympathies. When the victory was at last won, in 1895, an admirable election law was enacted and faithfully enforced; and Maryland enjoyed, for the first time in a generation, the privilage of fair and orderly elections. When the regular Democrats again got control of the Legislature and the Governorship, they made modifications of the election law, especially in certain counties, which have permitted gross trickery and fraud; but the elections in Baltimore, and in a large number of the counties, are still fair and clean, and the independent vote still holds the balance of power between the parties. In fighting the amendment, therefore, the Baltimore Reform League and great numbers of independent Democrats throughout the State are not only opposing a flagrant disfranchising trick, but are also seeking to prevent the restoration of that ring rule which was so long the shame and the despair of good citizens.

Gov. Harmon's best friends, in and out of Ohio, will rejoice to hear that the Democratic State bosses have declared war upon him. It is a good augury for the future of the man about whom centre the hopes of many old-fashioned Democrats the country over. No aspirant for the leadership of a reunited and revivified Democracy can start better than Cleveland did—with the hatred and the fear of the political machines to his credit. The outbreak against Mr. Harmon is due, of course, to blasted hopes and sadly empty pockets. The Governor has refused to be "manipulated." Republican officeholders have not been turned out of doors to make room for the hungry among the faithful. The cry for jobs has made the Ohio welkin ring, but the Governor's heart has been of stone. Whereupon the Democratic machine leaders have discovered that giving them the jobs was what Mr. Harmon was elected for, and that he has consequently violated his pledges to the people. "Gov. Harmon," says Ohio's indignant national committeeman, "was supported with the idea that a complete change would be made in the State House and all State institutions. Hopes, however, have been vain." Hence 40,000 Republicans who voted for him will not vote for him again, and 40,000 Democrats will cut him. But those who wish Gov. Harmon well must advise him to snap his fingers at these men in buckram.

The State of Washington is the latest to respond to the movement in favor of the commission plan of city government. Tacoma has already voted to adopt that method, and a campaign has been started in Spokane looking to the same end. The Tacoma election was disappointing in that it was decided by less than a quarter of the voting strength of the city; the vote in favor of the change was in the proportion of 4½ to 1. Perhaps the small percentage of the possible voting is due to the fact that Tacoma has been overburdened with special elections lately. The charter election was the seventh held in that city this year, and there are two more to come. In Portland, Ore., last summer, a proposal to take up the commission system was submitted along with more than thirty other questions. The electorate had no mind for so large a mouthful, and rejected practically the entire programme. It is worth noting that the saloon element in Tacoma was strongly against the new plan. The charter adopted is of the general type, providing for an administrative and legislative board of five men, elected on ballots bearing no party names or emblems. The initiative, referendum, and recall are provided for.

In a year prolific in reminders of America's debt to Champlain, to Hudson, to Verrazzano, it is now the turn of Don Gaspar de Portolá. Californians have, however, fêted not merely the first white man to gaze upon the Golden Gate, but likewise their own accomplishments:

> Hail to thy daring, to thy cheery mood,
> And stormy progress, brother multitude!

The cosmopolitanism of San Francisco's heritage appears in the merrymaking.

"The smelting pot of the races," Stevenson called the waterfront. One found there black men, yellow men, beggar men, thieves. There were Laskars in turbans and dis-bralded Chinese and Italian fishermen in tam o'shanters and wide, gaudy sashes—Greeks, Alaska Indians, and men of the South Seas. That was the old San Francisco—or a part of it. The new city is more American, and has fewer suggestions of the San Francisco of Bret Harte's Argonauts. It is their future to which Californians are looking even in celebrating Portolá. In a paragraph printed in the San Francisco *Call* of April 15, 1906—or just before the earthquake—it was said: "Our destiny is upon us. We cannot escape it." Fire and earthquake have done their worst, but San Francisco's destiny is upon her still.

A long and honorable judicial career is ended by the death of Mr. Justice Peckham of the Supreme Court. Special attention was drawn to him at the time of his appointment by President Cleveland, owing to the sensational rejection by the Senate, under the prompting of David B. Hill, of the two preceding nominations of Mr. Hornblower and Wheeler H. Peckham. Judge Peckham, however, gave himself with unremitting labor and unusual ability to the work of the court, and soon ceased to be thought of except as an upright and useful member of our highest tribunal. His service fell in a time when many important and agitated questions were passed upon by a court too often divided; but Judge Peckham's opinions were always without extra-judicial heat, and were marked by great lucidity and cogent reasoning. His death, with the fact that two or three of his colleagues are humanly certain to retire soon, suggests the probability of a reconstitution of the Supreme Court during President Taft's term of office. The promise of fit appointments is bright at the hands of an Executive who has himself been a judge, and who will not allow politicians to dictate to him the naming of the Federal judges.

The death of Henry Charles Lea, at the age of eighty-four, removes one of the very small group of American scholars and writers of true distinction and admitted importance. His life was as different from the common run as his work was superior to the ordinary literary output. The son of a prosperous Philadelphia publisher, and engaged in the publishing business himself from his youth up, he was the possessor of an ample fortune and the head of an important business concern; but he found no difficulty in leading a laborious life devoted to intellectual pursuits. In making himself master, and one of the world's greatest authorities, in a large field of historical research, he was continuing one of the most pleasing of English and American traditions, that of the man of wealth and business who is also a scholar or literary man of real merit and significance. It is a lesson of Mr. Lea's career that there are still great results which can be achieved by individuals unconnected with any organization for the systematic production of learning. And it is proper to mention that, while his interest was so largely absorbed by a subject very remote from the doings of to-day, Mr. Lea did not fail to bear his part as a citizen.

The advertising campaign planned by the Home Missions Council is more comprehensive than novel. Churches have long practised advertising, and clergymen of a certain type have been known to have the habit. The religious motto painted large on the landscape, or stuck in the form of a minute paster on the car window, goes far back in time. What is new is that the churches now intend to advertise "social, racial, and economic" truths as well as religious, and to do so through the regular medium of newspapers and periodicals. In such a case, what will there be left for the newspapers and magazines to put into their reading columns? We know how hard the passionate press-agent will work to smuggle a bit of advertising into the reading matter. We know what importance is attached to the three asterisks that separate the paid truths from the unpaid. We know what the man in the street means when he scornfully invites the bore to go hire a hall. Why, therefore, should the churches expend large amounts of money to get "social, racial, and economic" matter out of the columns where everybody reads it into the columns where, the presumption is, nobody looks for it unless he is strongly impelled? The magazines we can understand. Their best-read and most attractive pages have long been in the advertising section. An article on the race problem that would be lost between a spring poem and a Wild West story will make a mark if inserted between the picture of an automobile and the advertisement of a safety razor.

The fatal injury to one of the Annapolis football players will not, we presume, greatly disturb the equanimity of those who, like Justice Oliver Wendell Holmes, believe that athletics are cheaply bought by the annual sacrifice of a few lives. This case is, however, bound to attract attention for several reasons. In the first place, the unfortunate midshipman was a trained player, and not, like many other victims, a member of a scrub team with insufficient teaching and control. Also this casualty indicates that, much as the game has been "opened up" by the new rules, the dangers still persist. The daily reports from the various football fields read as of old in their descriptions of the injured and their hurts. So long as violent physical contact is permitted, just so long will more or less serious injuries continue. But a further change of the game in the direction of the English contest ought to be of some help. Hence we regret to note in the games thus far a marked disposition to return to the "old-fashioned" style of play and a neglect of the onside kick and forward pass which did so much to lighten the strain on the players and increase the interest of the spectators.

When Prince Von Bülow decided to give up the Chancellorship rather than appeal to the country on his finance bill, he showed his customary sagacity. What would have happened to the Government's thin majority in a general election is indicated by the remarkable victories of the Social-Democrats all over the Empire. It did not take them long to recover from their heavy defeat of three years ago. Three years of Dreadnought-mania, a growing deficit, and the logical recourse to increased taxes on food, drink, light, and air, have swelled the ranks of German discontent. Where in 1906, after the famous Imperial victory, it was all talk of scotching the Socialist serpent by restricting the franchise in Hamburg, in Saxony, and Berlin, heavy Socialist gains are now reported, or have been recently reported,

from Prussia, from the Rhineland, from Saxony. In the Saxon Diet the Socialists bid fair to leap from a membership of one to a membership of twenty-five, possibly, or nearly a third of the entire Diet.

The German Governments have all the more reason to fear these results, on account of the possibility that the Socialists may consent to join hands with Radicals and Liberals in the Reichstag and the Diets. Opportunism, or revisionism, to give it its economic name, is making headway among Bebel's followers. The orthodox doctrine of complete abstention from the process of bourgeois law-making received a severe setback last year when the Socialists in the Bavarian Diet joined with the Centre to force through a number of progressive measures. In the Socialist Congress at Leipzig, last month, the new moderation was evident. There were none of the old anti-patriotic outbursts which more than anything else have driven the Liberals into the Government camp. There were no fiery onslaughts on religion. A proposal to establish Socialist schools for children of non-believers received less than 30 votes out of 300. The cause of all this is the natural weariness of a policy of mere negation carried on through decades.

The fall of the Spanish Ministry may have been inevitable for other reasons, but it was undoubtedly hastened by the agitation over the execution of Professor Ferrer. To the flood of foreign protests were added cries of shame and outrage in Spain itself. A political and moral atmosphere was rapidly created in which the Prime Minister, who was responsible for the extinguishing of one held a light of his country, could not breathe. Premier Maura's resignation involved the summoning of the leader of the opposite party to form a Government. How long Señor Moret's Ministry may go on without the need of electing a new Cortes is still doubtful. In any event, the new head of the Cabinet is not to be envied his task. Popular dissatisfaction with the slow progress and disappointing results of the Riff campaign is again mounting, and with internal discontent fed by other causes, the outlook is troublous not only for the Ministry, but for the monarchy itself.

It is natural enough that the meeting between the Czar and the King of Italy should bring up again our old friend, the break-up of the Triple Alliance. Royal encounters are always supposed to be fraught with tremendous matters of state, and surely, in the present instance, Nicholas II would never have undertaken that painful trip of a couple of thousand miles between two walls of bayonets, if he were not really eager to join hands with Victor Emmanuel against their common aversion, Austria-Hungary. But experience has shown that the Czar's momentous interviews with the heads of foreign governments have usually meant little for Europe at large, but a good deal of trouble for Russia. The Czar comes to take advice and get help, never to offer it, and Italy, for all her irritation against the Hapsburgs, is pretty sure to remember what a weak reed to lean upon the Czar turned out for France in her hour of need. It is typical of a blundering mis-government like Russia's that it will go far enough to exhibit its spite but seldom far enough to make its enemies take it seriously. Whatever may happen to the Triple Alliance in the course of years—it is beginning to show unmistakable signs of dissolution—at least no mortal blow will come from the side of Russia.

The assassination of Prince Ito at Harbin seems to bear out the old rule that the fanatic's knife or bomb most often strikes either when it should not or whom it should not. Such broken information as has come to us out of Korea, since the Japanese investment, has represented Prince Ito as the one Japanese statesman most concerned in mitigating the rigors of foreign domination at Seul. If that was the case, the death of the veteran statesman at the hands of a Korean patriot falls akin to the assassination of President Lincoln by a Southern sympathizer, or the assassination of Alexander II of Russia on the eve of his granting a Constitution. But we cannot press the point too far. The other tendency has grown up of asserting that every incompetent monarch who fell a victim to popular resentment was just on the eve of blossoming into an archangel and establishing elysium within his dominions. Nor does a murdered statesman become thereby retroactively the best friend his murderers really had. If the Korean people came to associate the cruelties of Japanese rule with the personality of the man who up to a few months ago was Japan's viceroy in the peninsula, the inference was a natural one. Certainly, they could hardly have registered their protest in more emphatic form. Not even an attack on the life of the Mikado would have roused the world at large as will the unhappy death of the best known and most gifted of Japan's statesmen, the one whose life has been most closely bound up with his nation's rebirth and imperial growth.

When an article on "The Public Debt of New Zealand" begins with pointing out that the net public debt per head of the population in that country is $314, as against $145 for France, $80 for Great Britain, etc., one rather looks for an exhibition of the Australasian experiment station as an awful warning. Such is not the case, however, with the paper in the *Journal of Political Economy*, signed by James Edward Le Rossignol of Colorado and William Downie Stewart of New Zealand as joint authors. The article is a quite colorless examination of the New Zealand public debt and its history. It explains at once that a very large part of the debt represents productive investments, and it mentions many other elements which must be taken into account before the true significance of the figures can be judged. One incidental remark is of special interest for this country. "The most common form of political corruption in the United States," it says, "the corrupting influence of railways and other business corporations, does not exist to any great extent in New Zealand, because of the prevalence of governmental and municipal ownership, but the concentration of economic power in the hands of the government has created a form of corruption which, while it may not be so bad morally, is far more wasteful from the economic point of view." The writers refer especially to the building of roads, bridges, etc., as a matter of local or personal favor, which is elsewhere referred to as "the current coin of political corruption." What dimensions this sort of thing would be capable of in our country, under government ownership of railways, it staggers the imagination to picture. It is prudent to watch these movements from afar.

THE DIPLOMATIC SERVICE.

When Mr. Taft returns to Washington he will find nothing more pressing than the reorganization of the diplomatic service. Ordinarily, the various posts abroad have been bargained off within a few days after a new Administration has assumed office. Mr. Taft wisely announced that he would take his time in selecting his ministers and ambassadors. Now, however, eight months have elapsed and some important appointments have not been determined upon. Several of them have gone begging in a way to cause considerable mortification, and the unfortunate affair with Mr. Crane cannot but add to the difficulty of obtaining a Minister to China, if not in choosing men for other posts. Moreover, there are many clouds upon the diplomatic horizon. Are we to have tariff wars with Germany, France, and Canada? Is there to be serious friction over Japan's policy in Manchuria? No one can at this moment answer these questions. That they can be asked is, however, in itself a strong reason why no time should be lost in filling the leading diplomatic offices.

Justice to the ambassadors alone demands this. No man can do his best work if he is in ignorance about his immediate future. Take the case of Dr. Hill, for instance. Is he to remain at Berlin, or to be transferred to another post or retired from the service? So far as we are aware, no official statement has yet been made as to his future. In Paris, Mr. Henry White, after remaining for months in a state of uncertainty as to when he would be relieved by Mr. Robert Bacon, has notified the State Department that he can hold his place no longer than November. Yet, despite Senator Aldrich's recent assurances, the question of a tariff war is apparently nowhere else so acute as in France. The situation in London is similar. Mr. Reid is obliging the State Department by holding on, though fully aware that his supersession may take place at any moment. But the President is unable to find anybody so eminently fitted for this post as would have been Dr. Eliot. That he has been asking many for suggestions has long been an open secret. No one can deny, however, that the failure to find the right man is injurious to the service and detrimental to the dignity of what is one of our greatest positions.

To Russia Mr. Rockhill has been sent from China, because, as was openly admitted, the Administration wanted a "live" business man at Peking. When it got one who was just of that sort, it treated him so roughly as to exasperate Mr. Crane's intimate friends. He was fairly dragged off his steamer, compelled to cross the country under public curiosity and suspicion, and then dismissed as one would discharge a commercial traveller. Before Mr. Crane was asked to take the mission, Stuyvesant Fish, F. A. Delano, ex-Senator Fulton, and others declined the position. He will be a brave man who will finally consent to fill the demand for a Minister in Peking. Meanwhile, the months drag on, and the United States, whose interests in the East Mr. Taft, above all others, deems of vast importance, is represented by a *chargé d'affaires* in China.

In Italy, Mr. Leishman has taken over the embassy in succession to Mr. Griscom; and Mr. Straus's appointment to Constantinople has been hailed with satisfaction by all interested in Turkey. The Japanese mission remains in Mr. O'Brien's hands; his pleasing personality makes him as welcome in Tokio as heretofore. But the office of Minister to Cuba, important now on account of our relations with that island, is yet to be disposed of, since the promotion of Mr. E. V. Morgan, the present incumbent, is understood to be impending. The Austrian and Mexican missions must also be re-manned, particularly the latter, in which Mr. Thompson has been occupying his leisure moments with the purchase of a railway to which he will hereafter devote his attention. Until all the places to be filled have been disposed of, the feeling of unrest will continue. Indeed, the whole situation must strengthen the hands of those who advocate a permanent diplomatic body, protected as a whole from the now inevitable upset on the inauguration of a President, and affording guarantees for a life career. As it is now, we have such a case as that of Mr. Riddle, lately Ambassador to Russia. Though a fluent linguist, master of Russian, and a graduate of the Paris School of Political Science, he has been dropped from the service after sixteen years in Russia, Turkey, Egypt, and Servia—not an encouraging example to the young American who aspires to fit himself thoroughly for diplomacy.

With the close of the holiday season it is to be hoped, too, that the State Department itself will be so fully manned as to make it impossible for any one else to charge, as did Mr. Crane, that he was started for his difficult and distant post without adequate consultation and instructions. Of this, Mr. Huntington Wilson's serious illness is, to be sure, a partial explanation. But there are disquieting rumors that, besides departing American diplomats and those awaiting orders, foreign diplomats also have had difficulty this summer in finding out just who is in charge of this policy or that negotiation. Mr. Adee is, of course, always on hand with all his valuable experience to aid him; but sometimes even an able second secretary does not quite take the place of his superiors. It will be a good thing for the whole Administration, not yet shaken down like a tested piece of machinery, when the holidays are over. Indeed, we are sometimes tempted to believe that a statutory prohibition of vacations during the first six months of a new Administration would not be amiss.

TROUBLED ENGLISH POLITICS.

No one can read the English press of both parties, or talk with Englishmen and others familiar with political conditions in Great Britain, without getting a pretty serious idea of the great controversy over the budget. It is a real crisis, though we cannot help feeling that it has been artificially created. The question of new taxation was difficult enough of itself; but the attempts on both sides to make political capital out of it, with the violence of extremists of either party, have blown the affair out of all natural proportions. It may yet serve as a classic illustration of what political passion can do to inflame and distort a problem of finance into something very near revolution.

Those are doubtless correct who maintain that no Chancellor of the Exchequer ever held such language as is the common stock in trade with Mr. Lloyd-George. Instead of dropping his old fighting and slashing manner, now that he is charged with weighty responsibilities, he has, if anything, intensified it. Of course, he does not lack provocation. Foolish dukes and reckless Tories are as much to blame for the political tension as are headstrong radicals and

swashbuckling Liberals. But when all is said, we look for more gravity and steadiness in the head of the British Treasury than the Chancellor of the Exchequer displays in his utterances whether in or out of Parliament. His speech at Newcastle, the other day, was a fine instance of how a great Minister of State should not harangue the public about taxation. Where Lloyd-George was defending the actual taxing proposals of the budget, he was sensible and defensible. The new taxes are really not very burdensome in themselves. They might be extended so as to be confiscatory, but it is not the English way to be logical in extending taxes or anything else; and the Chancellor might well have rested with the economic and fiscal defence of his measures. Instead, he launched into a violent attack upon the House of Lords—made up, he said, of men "chosen by accident from the ranks of the unemployed"—and indulged in language which gives point to the charge of his opponents that he is a Socialist at heart. We cite a few words from his peroration to show the kind of social dynamite that Mr. Lloyd-George tosses about light-heartedly:

> Who ordained that a few should have the land of Britain as a perquisite, who made 10,000 people owners of the soil, and the rest of us trespassers in the land of our birth; who is it—who is responsible for the scheme of things whereby one man is engaged through life in grinding labor, to win a bare and precarious subsistence for himself, and when at the end of his days he claims at the hands of the community he served a poor pension of 8d. a day he can only get it through a revolution; and another man who does not toil receives every hour of the day, every hour of the night, whilst he slumbers, more than his poor neighbor receives in a whole year of toil? Where did the table of the law come from? Whose finger inscribed it? These are the questions that will be asked. The answers are charged with peril for the order of things the Peers represent, but they are fraught with rare and refreshing fruit for the parched lips of the multitude who have been treading the dusty road along which the people have marched through the dark ages, which are now emerging into the light.

It is not strange that sober-minded Englishmen find it hard to reconcile themselves to a budget which has such doctrines tagged to it.

However, the practical question how the Lords are to deal with the budget when it reaches them remains very much what it was. As the time approaches when action must be taken, counsels are divided and the outlook is confused. It should seem a good case for English compromise; but recent declarations of responsible Ministers have been wholly unyielding. The measured and dignified Prime Minister, Mr. Asquith, is as explicit as the impetuous Lloyd-George and the harum-scarum Winston Churchill in asserting that no interference of the Lords with a money bill can be tolerated. If they amend or reject it, the Commons will at once resolve that there has been a breach of their privileges; and then there could not fail to be an appeal to the country in which the whole veto power of the House of Lords would be the chief issue. It is fear of this and what might follow which leads the *Spectator* to think that it is better to accept the budget, disagreeable as it is, than to throw the British Constitution into the melting-pot of a general election. Notable, too, is the opinion of the Birmingham *Post*, which is, or at any rate was, the organ of Joseph Chamberlain. It advises the Lords that they have too much to lose and nothing to gain by rejecting the finance bill. The evidence that the country wants the land taxes, this Conservative newspaper thinks to be conclusive; and it adds that "a dissolution on the finance bill would almost certainly be followed by a return of the Government to power with a definite mandate which the Lords could not ignore." The Glasgow *Herald* is equally convinced of the bad policy of rejecting the budget. Of course, many Conservative organs, the London *Times* at their head, strongly urge the Lords to throw the bill out. Mr. Balfour, however, has not spoken. Till he does, the Lords will scarcely know which way to turn.

In their perplexity, they are expected to get new light from the bye-election that is held in Bermondsey to-day. This is a London constituency described by Charles Booth as the poorest in the city. The population is about 80,000, of which a large proportion depend upon casual labor, and many families are always upon the verge of want. It is thus a working-class constituency, and it was thought that it would afford a fine test of the "popularity" of the budget. But a three-cornered fight is raging, the Labor party having put up Dr. Salter, who appears to be that unusual combination, a Quaker of extreme Socialistic views, and it is quite possible that he, with his programme of the right to work, a minimum wage, and the nationalization of land, railways, and mines, with the municipalization of everything else, may win over both the Liberal and Conservative candidates. In that case, the Lords would be in greater doubt and darkness than ever. Even should the Tories win, it might be disastrous for them to pluck up courage from a single election. In 1880, when Beaconsfield was in doubt whether to go to the country, as Gladstone was challenging him to do, he carried a bye-election and that decided him to dissolve. But that bye-election was, curiously, also in Bermondsey, and after winning it, the Conservatives were badly beaten in the general election.

THE FUNCTION OF THE COLLEGE.

When it is stated that President Woodrow Wilson has written a magazine article of considerable length upon a fundamental question of college education, it is almost superfluous to add that a contribution at once substantial and attractive has been made to the discussion. In his article in *Scribner's Magazine* entitled "What Is a College For?" he surveys the present condition of life and study at the typical large American college, judged both by the end which the college proposes or should propose and by the efficacy of the arrangements actually in operation for the attainment of that end.

On the first branch of the question President Wilson's thesis is laid down with great emphasis and insistence. It turns altogether on the complexity of the modern world—on the demand for intense effort, and for the capacity to turn with vigor and effectiveness to any task, however unexpected, to any problem, however novel, which the changes of the time may present. A picture—decidedly overdrawn, we submit, whatever be the number of instances on which it may be based—is presented of the way in which the man whose only capital is some special skill is condemned to be a servant perpetually, and may at any time become a useless servant, his "skill gone out of use and fashion." To lead a life worthy of a young man's aspirations, he must prepare himself to meet and conquer all the chances and changes of the time; and the function of the college is to equip him for such a rôle. "To me," says

President Wilson, "the question seems to be, Shall the lad who goes to college go there for the purpose of getting ready to be a servant merely, a servant who will be nobody and who may become useless, or shall he go there for the purpose of getting ready to be a master adventurer in the field of modern opportunity?"

Into the other branch of Mr. Wilson's discussion it is impossible here to enter in a manner at all adequate; nor would it be proper for any but an expert in questions of college organization to pass judgment upon it. The breakdown of the old college discipline, based on the boarding-school idea; the development of the multiform activities —athletic, social, literary, business— which now absorb so large a portion of the student's time and interest; the dominant part played by college fraternities and other social groups—these are brought out vividly and are correlated with the main theme. In all this development President Wilson finds an inevitable process of evolution, due to the need of something that the college as such has not supplied; and he draws the picture not merely as a presentation of historical fact, but for a definite practical purpose. The absorption of time and interest involved in these extra-collegiate activities makes it impossible for the college to utilize the four years of precious opportunity for its own great purposes; and President Wilson proposes such a remodelling of the relations between faculty and students as shall turn all the vitality now scattered in these accidental ways into the right channel. "The organizations whose objects lie outside study," he says, "should be but parts of the whole, not set against it, but included within it."

With nothing that President Wilson says in regard to the ways and means of effecting a needed improvement in college life have we any quarrel; and there is in the whole article a high seriousness, both of substance and of form, that makes us regret the more that we find in it a radical defect. We submit that there is an issue deeper and more vital than any of those discussed by Mr. Wilson, however important these may be; and on this issue his note does not ring true. The preaching of the gospel of strenuosity has gone far indeed when one can read page after page of an essay so serious as this, and coming from such a source, yet find barely a hint that there may be a value in college culture other than what is measured by outward achievement. Of the effect upon a man's inner life, of the satisfaction he may get simply from a broader outlook or a deeper insight, of the heightened joy and added solace which the treasures of literature or the interests of science may afford him because of those four golden years, there is no word. Nor can it be justly answered that all this has been omitted because it is matter of course. In the first place, in our day, with the din of the preachers of efficiency as the one and only good ever in our ears, it is not matter of course. And secondly, Mr. Wilson sins not only by omission, but also by commission. Again and again, he strikes the strident note that is the fashion of the day: "To be a master adventurer in the field of opportunity" should be the purpose of the college student; and again: "We must distinguish what the college is for, without disparaging any other school, of any other kind. It is for the training of the men who are to rise above the ranks." Struggle, conquest, "doing things"—that, it should seem, is the be-all and end-all of modern education.

Against this view of the function of the college, we hold it to be the duty of all men of culture to protest. Unquestionably, the college should be a nursery of leaders, of men who go to the front both in the competitive pursuits of ordinary life and in the advancement of the welfare and progress of their country and of the world. But what of the score of youths who are not endowed—perhaps in ability, perhaps in temperament—for such a career, as against the one who is? Is there nothing for them in the college? Nay, is it nothing for the country and the world that the type which they represent shall be preserved? Are we to admit that "things are in the saddle" so absolutely that to be a gentleman of taste, or refinement, of a generous and unambitious interest in high and beautiful things is to "be nobody"? With all its restless progress and resistless changes, there is still, we trust, room in the world for the quiet and cultivated gentleman who is content to earn a modest living, or even to live a life of rational ease in unobtrusive performance of unpretending duties; and we do not think it would be going too far to say that the college will lose sight of what is the most beneficent part of its entire activity when it ceases to regard with pride and satisfaction the furnishing of this leaven to our overstrung and strenuosity-ridden society.

FIFTY YEARS OF VICTOR HUGO.

PARIS, October 12.

It is fifty years since Victor Hugo began pouring out to the world "La Légende des siècles." Its successive utterances, with minor poems of the same strain in between (1859-1877-1883) express that modernizing vision of the past which now most pleases official French thought. Popularly, there are fifty copies of Alfred de Musset's poems sold for one of Victor Hugo's. There are even signs of the newest Young France turning altogether back from the nineteenth to the seventeenth century—the *grand siècle* once more.

The Société Victor Hugo, which charges itself with the master's fame, seized the occasion of the half-centenary for a week of celebration. Sunday, September 26, the Comédie Française played "Ruy Blas" at the matinée. Then, on successive days, there was a visit to the poet's house, which has been turned into a Victor Hugo Museum; the inauguration, in the historic gardens of the Palais Royal, of Rodin's statue, which has been waiting fifteen years for the day; a pageant of the Cour des Miracles, which was to have illuminated the façade of Notre Dame with Esmeralda and Frollo, but was spoiled by desperate weather; and the final obligato banquet—all with occasional verse and discourse and speeches from Government.

Perhaps the importance of the anniversary has been overrated. In 1885 political and religious exaltation of the Republican and Freethinker made an international demonstration out of the poet's interment at the Panthéon, the church being expelled to make room for his corpse. In 1902, for the centenary of his birth, the desire to recognize nationally the one overmastering genius of French poetry in the century which was past gave a genuinely literary color to the celebration. The present interest in "La Légende des siècles," taken apart from the poet's complete work, should be rather to know the appeal which Victor Hugo's ideas and art have continued making to the changing literary judgment and feelings of France during fifty years.

In 1859 the old official criticism was still intrenched in the university citadel, in spite of thirty years of attack and defeat at the hands of the Romantics. Désiré Nisard was its spokesman in

his "Etudes d'histoire et de littérature" of that year:

> The history of the works of M. Victor Hugo is the history of ephemeral books which graft on to the day's commonplaces or imitate like works, and in which the merit of invention does not belong to M. Victor Hugo. I do not know one of his books of which the thought is his own. . . . You would almost say that M. Victor Hugo is condemned to be in truth but "a child of genius," as M. de Chateaubriand called him.

Nowadays, M. Doumergue, who as minister of public instruction is grand master of the university, begins his inaugural discourse for Rodin's statue:

> The government of the republic could not allow the fiftieth year of "La Légende des siècles" to be celebrated without taking part in it. The glory which Italy owes to Dante, which Shakespeare has given to England, France, without excessive pride, can give thanks for to Victor Hugo. . . . Some, I know, not understanding his genius or irritated by it, have denied him the thinker's glory. But his word at which the world wonders, could it so thrill us if he had lacked that inner flame which strong thought alone can kindle?

With a tone of combat, the minister wound up his eulogy:

> Glories of mediocrity do not resist the effect of distance and the intense life of our day. But the figure of Victor Hugo, as it withdraws in time, far from entering into shadow and obscurity, stands out in piercing relief, like the decided features with which the sculptor here makes him to live again for us. In the name of the government of the republic I make my salute, bowing with the homage of an admiration which has not weakened.

And yet, in the testy foolishness of old-fogy Nisard, may there have not been a glimmer of reason? Like Carlyle, the English writer whom he resembles essentially in more ways than one, Victor Hugo "always felt himself qualified *à priori* to crack and pick any philosophic nut extant; to discuss and determine the toughest providential problem conceivable, without a taking of testimony or investigation of any sort, but by sheer force of genius or æsthetic instinct." Better fitted still to Victor Hugo's case is this further judgment of Carlyle by the elder Henry James: "He did, indeed, dally with the divine ideas long enough to suck them dry of their rhetorical juices."

It would be difficult to find, in the expressions of French thought to-day, a single idea brought into it by Victor Hugo. The theism of his prime and the doubtful pantheism of his age are alike formless, with only the splendor of color; and, even his declamations on a practical subject so worked by him as capital punishment have left merely resonant emotion. Nisard, who saw only printed pages through his spectacles, might easily find chapter and verse for the original propositions of the poet's thoughts: his disastrous failure was in his inability to estimate at its proper value the transforming, often deforming, poetic imagination, of which Victor Hugo was all compact.

The poet seems to have had a glimpse of the truth in the name he chose for the great work which he assured Vacquerie, in a letter of March, 1859, "shall contain mankind, shall be mankind." Among unpublished notes for a preface, he wrote: "When you consider the human series parallel with the series of the centuries, man has two aspects—the historic and the legendary. The historic aspect borders on the drama; the legendary on epic poetry." The name for his work was to be "Petites Epopées." And he wrote his own idea of the work in characteristic lines, now published for the first time:

> Ceci sera la page énorme; et les vivants
> L'auront vue, au milieu du vaste effort des vents,
> De l'erreur, de la haine ardente, de la foule,
> De tout ce qui s'élève et de tout ce qui croule
> Et de tout ce qui va dans la nuit, emportant
> Le chiffre vain, le rêve obscur, l'homme hésitant,
> Demeurer, et garder son accent inflexible.
> Flèche, reste le roi, peuple, reste la cible,
> Jusqu'au jour où viendront d'autres hommes disant:
> Toi, sois la flèche, et toi, sois la cible à présent.
> Alors commenceront les sombres destinées.

Until then Victor Hugo had been the transformer of French poetry in general. For Sainte-Beuve, he was of "lyric renown"; for Théophile Gautier, whose "Histoire du romantisme" appeared only a few months before "La Légende des siècles," the turning point was the drama of "Hernani":

> A movement was wrought like that of the Renaissance. . . . We seemed to have found again the great lost secret; and it was true, we had found again poetry.

Two years later Baudelaire wrote:

> When we remember what French poetry was before Victor Hugo appeared and how it has grown young again since he came; when we imagine the little it would have been if he had not come, how many deep, mysterious feelings which have found expression would have remained mute; how many intelligences he has brought to their birth, how many men have shone by him who would have stayed in the shadow, it is impossible not to regard him as one of those rare, providential spirits who work in the literary order the salvation of all, as others do in the political order.

Voices were still raised in opposition. Common-sense, *bourgeois* Francisque Sarcey remarked in 1868 that he had "always professed mediocre sympathy for the dramas of Victor Hugo." In 1881 Zola, in the full success of his naturalism, while naming Victor Hugo "the man of the century," did not fear to pronounce his new work, "L'Ane," an *incroyable galimatias*. The theatre-going public has ratified Sarcey's judgment, while Racine still holds the stage. You seldom meet young Frenchmen who have read the lyrical poems of Victor Hugo; and the new education turns minds definitely away from his purely poetic imaginings. The verses of Richepin and many a lesser playwright do, indeed, echo the master's sonorous line; but his lack of social perception, without subtlety or suppleness or delicate shades of feeling and wit, has stood finally in the way of any Hugonian school among generations bred in psychology.

In the tribute which French men of letters presented to Victor Hugo for his eighty-third birthday, Zola, seemingly unconscious of its fundamental criticism, uttered what is still the truth:

> In Victor Hugo, I salute the poet victorious from ancient combats. To honor him with our worship to-day is to protest against those who hooted after him in those days.

The battle was already won. Four years later when the poet died, the unliterary Clerical newspaper, *La Croix*, amidst all the intentionally offensive apotheosis of the Panthéon, had nothing worse to say than this:

> Victor Hugo died at 1:35 o'clock.
> He was the greatest poet of our age.
> He had been mad for more than thirty years.
> May his madness be his excuse before God.

Now, after twenty-five more years, it is evident that the poetry of the years of madness—"La Légende des siècles"—towers high above all the other poetic work of Victor Hugo, as Paul de Saint-Victor, who had been Lamartine's secretary, prophesied it would. True, as the governmental speeches show, the odor of combat is still in the air. Yet even if the sympathy of France, official and popular together, should move away from him, French poetry and all literature can never again be quite as they were without him. When he died Henry Houssaye could say:

> All who wield a pen to-day, prose writers as well as poets, journalists as well as playwrights, in greater or less degree proceed from him. His imprint is on modern style.

Strip this celebration of the fiftieth year of "La Légende des siècles" of its factitious surroundings, and it is the genuine tribute of the new century to what Emile Faguet calls "the gong in Victor Hugo's brain. . . . Incident, anecdote, events struck upon it, and there was grave, sweet music or resounding thunder."

S. D.

NEWS FOR BIBLIOPHILES.

More than two years ago there were printed in this column some notes on the variations in several early editions of Sheridan's "School for Scandal," including particulars of two American editions, one printed in Philadelphia by Robert Bell, in 1782, and the other by Hugh Gaine in New York in 1786.

There has just been brought to our attention another Philadelphia imprint, with a similar title, "The School for Scandal. A Comedy. The Third Edition. London: Printed. Philadelphia; Re-printed and Sold by Thomas Bradford, at the Coffee-House. M. DCC. LXXIX." An examination of the text, however, shows that while the characters, so far as they appear, are the same, the text is not that of Sheridan's play at all, but is political in purpose, relating to English affairs during the American war. Washington is once referred to as "General Washinghall." Baker in his "Biographia Dramatica" enters "The School for Scandal, 8vo. 1778," and describes it as "a paltry catch-penny, intended to be imposed on the public as the genuine production of Mr. Sheridan. This despicable piece is political." Bradford's American edition is recorded by Hildeburn and copied from him by Sabin, but it is undoubtedly very rare. Baker notes another political piece with the title "The School for Scandal. As it is performed by His Majesty's Servants," 1784. "This," he says, "has no more relation to Mr. Sheridan's piece, than lead has to gold. It is a political satire on the India Bill and the Coalition." Sheridan's play was produced at Drury Lane Theatre on May 8, 1777. The first edition, printed in Dublin for J. Ewling, is without date and in booksellers' catalogues is usually ascribed to 1781; but, as Mr. Pollard has said, it is more likely that 1778 was the correct date. The title was an attractive one, and was appropriated for this political piece, which, by the way, is dedicated by its anonymous author to Richard Tickell, who was afterwards Sheridan's brother-in-law. There was reason for Robert Bell, in bringing out the first American edition of the play in 1780, to call it "The Real and Genuine School for Scandal."

On November 3, the Anderson Auction Company will sell a collection largely made up from the library of Mr. Sainshury Langford Sainsbury. A presentation copy of Mrs. Browning's "Poems" (1844); first editions of Sir Thomas Browne's "Hydriotaphia" (1658), and the first authorized edition of the "Religio Medici" (1643); first edition of Keats's "Endymion" (1818); a collection of books with Alken and Cruikshank plates, including "Real Life in London" (1821-22) and Ireland's "Life of Napoleon Bonaparte," 4 vols. (1828), are notable lots.

On November 4 and 5 the same house sells the second part of the J. C. Chamberlain collection. The first portion, sold last February, was made up of the books of the ten great American authors. The first editions of Aldrich, Curtis, James T. Fields, Cooper, Halleck, Harte, Mitchell, Parkman, Stedman, Bayard Taylor, Walt Whitman, and other lesser lights are now offered, as well as some duplicate copies of books included in Part I. Among special rarities by minor authors we may note Aldrich's "Père Antoine's Date Palm" (1866), "Pansy's Wish" (1870), and "The Story of a Bad Boy" (1870) on large paper (six printed, of which three were destroyed in the Boston fire of 1872); Drake and Halleck's "Poems by Croaker, Croaker & Co." (1819); Howell's first book, "Poems by Two Friends" (1860); Motley's two novels, "Morton's Hope" (1839) and "Merry Mount" (1849); Stoddard's "Footprints" (1849); Taylor's "Ximena" (1844), his first book with title reading, "By James Bayard Taylor"; and Whitman's "Two Rivulets" (1876), the author's own copy, with many autograph corrections. Among the duplicate books by some of the ten great authors are Hawthorne's "Fanshawe" (1828); two copies of Lowell's "Poems" (1844) on large paper; and Longfellow's "Outre Mer" (1833-34). The "Rime di Michelagnolo Buonarroti" (Florence, Giunti, 1623), the very rare first edition of Michael Angelo's poems, is one of the few foreign books in the collection.

On November 1 and 3 the Merwin-Clayton Sales Company offer a collection of Americana including about thirty-five lots on California, books on the Indians, first editions, a collection of Lincolniana, and a series of autograph letters, mostly of American authors. On November 4 and 5 they sell the library of the late Rev. Joseph E. Chapman of Perth Amboy. Books and pamphlets on New Jersey, the American Revolution, and several editions of the Book of Common Prayer are included.

On November 3 and 4 Messrs C. F. Libbie & Co. of Boston will sell the libraries of James Brown and David J. Lord. Mr. Brown's Burns collection was extensive, including a copy of the very rare first edition "Poems chiefly in the Scottish Dialect" (Kilmarnock, 1786), the second edition (Edinburgh, 1787), and later editions, among them a fine extra-illustrated set. Another copy of Bryant's "White Footed Deer" (1844), a book which brought $285 in the Poor sale last year, turns up in this sale. Audubon's Birds (1840-44) and Quadrupeds (1849-54); Michaux's "North American Sylva" (1819), with the supplement by Nuttall (1849), and Wilson and Bonaparte's "American Ornithology" (1808-33), 13 vols. in 7, are important natural history books with colored plates. A long series of first editions of Bret Harte, collections of books on fencing and memory culture, Kelmscott Press and Doves Press publications, and a lot of book-plates and books on book-plates, including a collection of 1,200 cards describing additions to Allen's "American Book-Plates," are also offered.

Correspondence.

HENRY CHARLES LEA.

To the Editor of The Nation:

Sir: The death of Mr. Lea is a great loss to historical science, of which he was the foremost exponent in this country and one of the world's recognized leaders. His subject, mediæval history, was in his deft hands, and with his exhaustive study, revived in the long series of volumes on church history and kindred topics. His reputation as a scholar and an author was greater abroad even than at home. His chief work was translated into French and Italian and German, and the scholars in those countries paid tribute to him. At home he was elected president of the American Historical Association, and was honored by degrees from our principal universities. Years of toil were spent by him in gathering great quantities of original material from Spain and Italy, from France and Germany, from Mexico and South America, and not only did he use it with advantage in his own volumes, but he gave access to it freely to younger students. His life was one of earnest research for the truth, and he put his conclusions in clear language, every statement supported by exact references to the sources of contemporary writings of authority.

But Mr. Lea was much more than a scholar; he was an active reformer and a masterful worker in every field for improving the nation, the State, and the city in which he lived. He was the leader in every real movement for improving the body politic, and whatever of reform spirit exists in Philadelphia and Pennsylvania owes its origin to him. During the civil war he was ardent in his zeal and his work for the Union, and his facile and graceful pen produced much of the useful literature issued by the Union League of Philadelphia, an important factor in guiding the war for the Union to a successful end. The son of a distinguished scientific man, Isaac Lea, who was a leading authority on many branches of natural history, Henry C. Lea in his boyish days contributed to the American Academy of Natural Sciences papers that attested his ability, industry, and originality. A small volume contained some verses and poems that attested his literary cleverness. It was in his maturer life, during an active business career as a publisher, that he began the collection of material for the succession of works on mediæval church history which surprised the scholarly world by their exhaustive and masterly character. His public benefactions to the University of Pennsylvania and to the Philadelphia Library and to many other institutions, showed that, although not himself a university graduate, he was fully alive to the importance and advantage of thus strengthening education.

The fact that the first and largest recognition of his work as historian and scholar came from abroad, ought to be a lesson to our own universities and the public organs of learning in this country. Great as is the praise given to Mr. Lea's works today, both at home and abroad, it was welcome to him only as an incitement to renewed study and authorship, and he leaves an unfinished volume on the subject he had made peculiarly his own, that ought to be published to show his method of work and his almost judicial impartiality in dealing with the material gathered in years of research from forgotten and neglected sources. He set an example of sound scholarship that has already been fruitful of good results in historical writing.

The *Nation* owes him this tribute, for he was among those who first took a substantial part in its establishment, and of more value than his money help were the literary contributions that he gave to its columns, when his time and his pen seemed fully engrossed by his studies and by his writings.

J. G. Rosengarten.

Philadelphia, October 24.

VERSE AND MELODY.

To the Editor of The Nation:

Sir: I am a little surprised this week to find condemned, in the music column of the *Nation*, a tendency which I had been accustomed to regard with not a little approval. If "Danny Deever" must serve as a point of departure for æsthetic discussion, at least the problem involved is by no means so slight as the occasion. First, I must confess that Damrosch's "cheap" setting of this poem, and its rendering by Mr. Bispham, have seemed to me pretty nearly what the piece required.

I believe, on the whole, there is a great deal of indefinite talk, and much more indefinite thinking, on the subject of what a "song" ought to be. The pre-Wagnerian librettists were not so far astray in one particular, at least; they recognized their limitations. They recognized—as many of us to-day have entirely forgotten—that one cannot attend to two different artistic appeals at once. The point has been discussed; sometimes, it is true, with little enough understanding; sometimes very ably. The latest and best treatment of it I know is in Mr. Yeats, the Irish poet's, book of essays, "Ideas of Good and Evil." Grateful indeed for the *Nation's* clear statement of the case, I find myself quite unable to accept your critic's final judgment. If art, as a French writer has said, is a species of hypnotism (allowing the epigram to contain at least this germ of truth, that artistic appreciation requires almost hypnotic attention), we must admit our inability to be hypnotized by two things at once. It is precisely as your critic says: there are "songs in which the music plays second—sometimes twenty-second—fiddle to the poem." Surely this is as it should be, in certain cases—most notably in "Danny Deever."

Either the poetic appeal predominates, or the musical. There can be no such thing as "two arts going hand in hand." In cases where they seem to do so, it is we who are deceived. Either the music forms a mere accompaniment, a chant as it were, for the poem; or the poem is a mere cord on which is strung the harmony. Of course, one thinks first of all of the Wagnerian opera, which I do not wish to discuss here in detail; I believe in this case we *know* the text, and rely on the music for the emotional appeal. Confining ourselves to songs, who is there who has not often felt, after listening to some elaborate musical setting of an intense lyric, that somehow it was all wrong, in spite of the excellence of the music—that the words did not require all this? I remember the first time I heard Debussy's music to Verlaine's magical revery, "La Lune blanche." Of course I knew the poem by heart, but I confess I did not listen to the words; I could not. The music held me entirely. And yet, as an artistic whole, I felt the performance to be unsatisfactory. The music did not—it could not—express exactly the same train and blendings of emotion evoked by the words. Instead of artistic unity there was a duality of appeal, a conflict.

It seems that we must either write music pure and simple, to a set of words that merely suggest the subject without exacting deep emotional effort; or, on the other hand, be content merely to *accompany* verse. Music written in the first of these two manners includes all legitimate opera and oratorio, together with such songs as, say, the sixteenth-century setting of "It was a lover and his lass," where a charming melody and movement (entirely different from the natural rhythm of the words) make the true appeal; or *Lieder*, such as many of Shubert's and Nevin's; or more popular songs, such, for instance, as "In Old Madrid." In the second class I am tempted to include the traditional music to Ophelia's "And will he not come again?"; and most certainly many modern songs, among which would be our "Danny Deever," "Mandalay," Mrs. Woodforde-Finden's "Less Than the Dust" and "The Temple Bells," and Tosti's "Goodbye."

It is asked: "What then is to become of music, of melody, if this continues?" One feels like retorting: "What is to become of verse, of poetry, if this opera business goes on?" I think the musical art, like the poetic, must either confine itself to its proper sphere, or be content with "playing second fiddle." Still, I can understand why such a view must be heresy to a musician. I suppose it is just because music is the most elusive of the arts that there is so little real musical criticism. That which calls itself "musical criticism" usually either confines itself to the discussion of technique, or wanders into the bypaths of "appreciation" and "interpretation." One yearns for more really intellectual dealing with musical problems; such as, for example, that least critical of critics, Mr. Arthur Symons, has given us in his essay on Strauss, in his "Studies in the Seven Arts."

C. H. Dickerman.

Philadelphia, October 21.

[Mr. Dickerman's remarks are worth pondering, but they do not answer our objections to the new tendency in song recitals. There are many poems, like "Danny Deever," to which it is a superfluity to add music. The fact that musicians formerly insulted poetry by using it as a mere scaffolding, is no reason why, now, meaningless music should be used as an excuse for bringing certain poems into the concert-halls. A song should be what it is in the Goethe-Schubert "Erlking"—an amalgamation of great verse with great music.—Ed. Nation.]

FRUIT-GROWING IN NEW ENGLAND.

To the Editor of The Nation:

Sir: During the past week in Boston the attention of the public has been called to the beginning of an organized attempt of the New England fruit growers to capture their own market. Of late years this market has been controlled by Western growers, notably those of Oregon. Their fruit is always perfect in form, highly colored, and well packed. It has been so attractive that New England orchardists have generally dropped their hands, feeling that competition was impossible. There have always been, however, men who knew better; and these men have at last, by preaching and by practice, succeeded in making people aware that New England has a chance after all.

This chance depends on five factors: (1) that New England orchard land is now cheaper than Western; (2) that the soil, as repeatedly proved, is not worn out, but with proper handling is excellent for fruit; (3) that the Eastern farmer can pick his fruit when it is more mature than the Western, and thus finer flavored; (4) that the cost of transportation is notably less; and (5) the answer to the question: Is the Eastern fruit as attractive as the Western?

To answer this question there has been held in Horticultural Hall, Boston, an exhibition devoted solely to New England fruit. No doubts of the possibilities of the New England orchard could survive an examination of the exhibits. Not only in flavor, but also in shape, in size, and in color, the fruits displayed were the equal of fruit grown anywhere else in America. This is, of course, the result of modern methods of spraying and general culture. What New England now has to learn is the common sense of marketing its fruit.

The first requirement here is proper limitation of varieties. Professor Craig points out that it is the part of wisdom to grow few varieties, but to become known for growing those varieties well. The *sense* of the fruit exhibition agrees with this, for while there were almost hundreds of varieties shown in small quantities, the large packages were all of a few varieties, in apples scarcely more than half a dozen. The second requirement is proper grading of the crop, so that inferior grades are either sold as such, or not brought to market at all. (It was a part of the purpose of the exhibition to illustrate means of the economical disposal of culled fruit.) The third requirement is attractive packing. Here the bushel box promises to supersede the barrel, while perhaps some day the basket of two or three dozen choice fruits will hold the retail trade. The sixth requirement is uniform branding, so that packages bearing the name of an individual or of an organization can be depended on year after year.

The most striking feature of this whole movement is that it has been endorsed by the Boston Chamber of Commerce. For the first time departing from its custom, the Chamber last week devoted one of its meetings to the encouragement and discussion of an agricultural enterprise. At its dinner there was presented a printed report on the possibilities of New England fruit-growing. Some 600 men, farmers and men of business, sat down together. The spokesman for the Chamber of Commerce promised help in securing legislation and fair railway rates; the spokesman for the farmers asked for capital. Nothing in the whole meeting equalled the roar of mingled delight and applause when J. H. Hale, the most prominent fruit-grower in the East, and, perhaps, in the country, referring to the preface to the printed report, cried: "Think of that, fellers—these city dudes showing us the chance that lies before us!" Then, turning to the bankers, he asked for confidence and support. "How much is Lee Higginson willing to put up?"

It is scarcely to be supposed that the movement will stop here. New England has in itself or within twenty-four hours of its borders a third of the population of the country, the third which is not only the wealthiest, but also—since it is the manufacturing portion of the country—the least

agricultural, wanting the best and ready to pay for it. The market is at hand, then, and not only the home market, but also the foreign, for New England is at the gateway of a great European trade in fruit. New England, let us believe, is coming again into its own. A. F.

Concord, Mass., October 23.

HETCH-HETCHY.

To the Editor of The Nation:

Sir: As the meeting of Congress approaches, the public is concerned about its action on the pending bills, confirming the use of Hetch-Hetchy Valley as a reservoir to supply water to San Francisco. Although this measure failed at the last regular session, it will be pushed again before the new Congress.

Those who seek to turn Hetch-Hetchy into a reservoir are endeavoring to establish the new principle that a national park is merely a temporary sequestration of the natural objects contained within its boundaries. They hold that national parks must cease to exist in time, by the appropriation of the utilities which they contain; and that a municipality has a perfect right to invade a national park, if it elects to do so, in spite of the fact that the same utility may be obtained easily elsewhere.

Ex-Secretary of Interior Garfield, who issued a revocable permit to use Hetch-Hetchy Valley, stated in his permit that: "The present water supply of the city of San Francisco is both inadequate and unsatisfactory." But the evidence taken before the Senate committee, and before the House committee, proved that the present water supply is neither "inadequate" nor "unsatisfactory." It appears in this evidence that the Spring Valley water system, which now supplies San Francisco with water, is ample for present needs, and is capable of being developed sufficiently to supply a population three times as great as the present population of San Francisco. The supply now is 36,000,000 gallons a day; and according to the carefully prepared statement of a former city engineer, it can be developed to 109,000,000 gallons a day. It appeared, further, in evidence, that the San Joaquin River, close at hand, may be pumped from for an additional supply of 150,000,000 gallons a day. So that San Francisco has close at hand a water supply sufficient for a population of 3,000,000; which is more than the city has ever stated can be obtained from Hetch-Hetchy. Moreover, from the evidence, it appears that, by using a remarkable natural filter belonging to the Spring Valley system, this water can be delivered in a filtered condition, equal in quality, if not superior, to what may be obtained from the Hetch-Hetchy.

Ex-Secretary Garfield, in his revocable permit, also made this statement:

> I do not need to pass upon the claim that this is the only practicable and reasonable source of supply for the city. It is sufficient that after a careful and competent study, the officials insist that such is the case.

This is a startling statement, to come from a leading official of the United States government. He held that it was not his duty to investigate, in behalf of the nation, before destroying the integrity of a national park. It would be interesting to learn how much public business he did on these lines; and it is not surprising that his successor has found a serious work at hand, in restoring the administration of the Department of the Interior to a law-abiding basis. As a matter of fact, the evidence taken before Congress showed that no source of water supply, other than the Hetch-Hetchy, had been seriously investigated or even considered by the city officials. All these officials of San Francisco tacitly admit that plenty of water can be had elsewhere.

If the people of the United States believe that the national park system is a wise and permanent feature of our national policy, they must make that belief effective in Congress next winter. If they wish to preserve the Yosemite National Park, which contains the Hetch-Hetchy Valley, inviolate in its natural grandeur, they must insist that their representatives in Washington shall abrogate the revocable permit which has been so injudiciously issued by ex-Secretary Garfield.

George Edwards.

Berkeley, Cal., October 8.

A BRITISH ICARUS.

To the Editor of The Nation:

Sir: We have often heard lately of Icarus and Darius Green as giving warning of the perils of aerial navigation. According to the legendary history of Britain, no less a person than the father of King Lear and son of King Hudibras was the first aeroplanist at whose flight the British neck craned and heart sank; and he suffered from adverse winds and treacherous machinery even more than the Wrights and Latham have done. Less wise than his near-namesake Blériot, King Bladud took his flight not above the Channel, but above London:

> He boasted that he would fly
> In the manner of a bird,
> That all his folk might see,
> And his flights behold.
> He made his feather-gear,
> And therefor he had mickle shame.
> To London he fared
> With his mickle folk.
> His feather-gear he put on him,
> And his flight there began;
> With his cunning flight
> He drew toward the upper air;
> He fared very high,
> To the welkin he was nigh.
> The wind came against him,
> His flights wavered,
> The strings broke
> That he stretched his wings with,
> And he fell to the earth,—
> The king was fated—
> Upon a place
> That in London stood,
> Apollin's temple,
> Which was the mighty fiend.
> The king fell on the roof,
> That he was dashed in pieces.
> Thus was the kingdom
> Of its king bereft.

Most of this is due to the imagination of our first distinguished poet since early Anglo-Saxon times, the twelfth-century country-priest Layamon (the original is in Madden's edition of his so-called "Brut," ll. 2870-97). Geoffrey of Monmouth's "Historia," his ultimate, and Wace's "Brut," his immediate source, have only a few words on Bladud's flight.

John S. P. Tatlock.

Ann Arbor, Mich., October 7.

PROFESSOR LOMBROSO'S CONFESSION OF FAITH.

To the Editor of The Nation:

Sir: Professor Lombroso's latest volume on psychic matters ("After Death—What?") has a pathetic interest from the fact that it was issued in America only three days before his own decease. If there is any answer to his question he knows it now. In his volume he expresses throughout a most profound belief in the survival of the mind after the dissolution of the visible body, and his preface shows that he wished the work to be taken as his *confessio fidei*, or last testament, to the world.

Hasty and superficial critics, spying a table of a few errata in the book, have leaped to the unwarranted conclusion that they are all due to a careless translator and proof-reader. The fact is that Professor Lombroso's manuscript was honeycombed with mistakes in English and American proper names, due, I judged, largely to his copyists, but partly to be ascribed to his astonishing handwriting, in which both his copyists and I had a good deal to struggle with in the way of emendations, interlineations, and additions. If you will catch a small housefly, dip his feet in ink, and then let him walk over a sheet of paper, the minute trails made will give some idea of the microscopically fine lines of this eminent pathologist. But nothing except a facsimile would adequately portray it. An aggravating feature of the professor's cacography was furnished by his habit of writing only a part of a word ("dimens" for "dimension" and "psicolog" for "psicologia," *e. g.*, my eye catches in a letter of his now before me, in reference to my translation). I found him, however, very patient in writing over and explaining illegible words, to the slight extent he was able to do so in revised drafts of his copy. I must say, however, that the task of licking his manuscript into shape, and tracing out and verifying his references and correcting his errors in English and American names, was rather formidable. And it is this background of unrewarded work in a book of this kind that superficial critics rarely recognize or understand, even when they have been through similar experiences themselves—a thing to make one wonder.

William Sloane Kennedy.

Belmont, Mass., October 21.

A SCIENTIST TO DR. COOK.

To the Editor of The Nation:

Sir: Dr. Cook tells us that he needs something like two months in order to prepare his records for submission to experts. What the experts want is the records exactly as they were made in the Arctic regions. If Cook insists that they must be revised or explained, let him at once place them in the hands of some competent body, such as a trust company, who shall hold them for such use as Cook wishes to make, provided that he works on their premises and in the presence of a trusty witness, who shall at the end of the work testify under oath to the precise nature of the additions that Cook has made; and let this sworn statement go with the records when they are submitted to experts

at Copenhagen or elsewhere. Cook's friends in particular are just the persons who should insist on this method of working the records up for examination. Without some competent and impartial testimony as to the nature of two months' work on the records, the public will be in grave doubt as to what is original and what is "improved." X.

Cambridge, Mass., October 22.

Literature.

HARPER'S FERRY AND GETTYSBURG.

John Brown. By W. E. Burghardt DuBois. Philadelphia: George W. Jacobs & Co. $1.25 net.

That so gifted a writer as the author of "Souls of Black Folk" should be tempted to write a new life of John Brown from the point of view of the negro is easily understood. It also goes without saying that Dr. DuBois has made a readable volume of his appreciation of the martyr of 1859, the fiftieth anniversary of whose execution is now at hand. So little have the negroes themselves as yet done to honor the memory of John Brown that this book might have taken on a special significance. But Dr. DuBois's work is disappointing in that it betrays no original research and abounds in inaccuracies. This is partly because he has relied upon his predecessors in the field. His is the eighth serious biography of John Brown to appear and unfortunately only one or two of these were written in the spirit or manner of the historian who desires to be impartial and to go to original sources for his information. Thus Col. R. J. Hinton's book is frankly a brief for Brown, and Mr. Sanborn's biography, a treasure-house of material, suffers from the author's association with the preparations for Harper's Ferry. It is, moreover, twenty-four years old and since its publication much has come to light, both in Kansas and elsewhere, which is of importance to the interpreter of Brown and his times.

For this and other reasons, Dr. DuBois leaned upon untrustworthy staves when he relied upon his predecessors. A few examples will suffice. He accepts Col. Hinton's attribution to Edmund Babb of Cincinnati of the anonymous letter of August 20, 1859, betraying Brown's exact plans to Secretary Floyd. But it has been known for years that David J. Gue, now living in New York city, was the author of that letter and that it was written not to injure Brown, but to save his life by heading off the raid. The full story Dr. DuBois will find in Benjamin F. Gue's valuable "History of Iowa," published in 1903. Again, he follows Redpath in accusing the Border Ruffians of wholesale assaulting of women in the early Kansas days. In the entire range of Kansas literature and manuscripts now available, there are but two recorded instances of this crime, and these are by no means wholly established, for at least one rests only upon Redpath's word, when acting as correspondent of an Eastern newspaper. Dr. DuBois also assumes, with another biographer, that John Brown's victims on the Pottowatomie had the benefit of some sort of trial. But not a scintilla of evidence has yet been produced to confirm this belief. Indeed, the facts all make against it. Again, Dr. DuBois accepts without investigation the repeated statements that John Brown was descended from Peter Brown of the Mayflower, although this is denied by the foremost authorities on the Mayflower genealogies. Finally, it must be noted that Dr. DuBois follows Sanborn, Hinton, and others in justifying the abominable Pottowatomie massacre, which, had it been perpetrated by Border Ruffians, would have been denounced as a crime against humanity.

But Dr. DuBois's own errors are numerous enough. He makes of George B. Gill, Brown's Kansas follower, a Canadian (p. 223), whereas he was an American; to Jeremiah G. Anderson of Indiana, born of sturdy, white farmer parentage, he attributes negro blood (p. 282), and Lewis Sheridan Leary, a free-born negro, becomes slave-born on the same page and is dubbed Lewis Sherrard Leary as well. Of the twenty-two raiders, Dr. DuBois says that "six or seven" were negroes; he adds John Anderson, a mythical raider, and Jeremiah G. Anderson to the five actual negroes, Leary, Copeland, O. P. Anderson, Green, and Newby. Incredible as it may seem, Dr. DuBois records that seventeen negroes were "probably killed" in the raid, when, besides four of Brown's negroes, Leary, Copeland, Green, and Newby, but two slaves lost their lives, and neither of these while fighting. He accepts also, in all its absurdities, the narrative of O. P. Anderson, the negro who escaped, and endorses it as a trustworthy document. Yet Anderson insisted, for one thing, that there were thirty men killed on the Southern side, in the face of Col. Robert E. Lee's official report to President Buchanan that there were but five deaths, all told, in addition to John Brown's own losses; and Lee is yet to be accused of falsifying facts or failing to obtain them.

Dr. DuBois is not, however, to be bound even by John Brown's words, for he evolves the astounding theory that the raid failed through the delay of the rear-guard in Maryland in moving the arms into Harper's Ferry before the trap into which Brown had walked was sprung. But, unfortunately for this, Brown repeatedly stated while in jail that he deserved to be hanged for his military blundering (for instance see New York *Herald*, November 24, 1859), and he assured Gov. Wise and others that his care for his prisoners led him to delay too long, despite the warnings of his men that he must leave the town at once. Part of Dr. DuBois's difficulty here is due to his belief that William Thompson, Brown's messenger to the rear-guard, failed to reach it. If he should read Terence Byrne's testimony before the Senate Committee of Inquiry and John E. Cook's confession, he would not only ascertain that Thompson did carry out his instructions but find many details with which he is now unacquainted.

Coming to John Brown's trial, Dr. DuBois says that the jury "was empanelled without challenge," although, in fact, Brown's counsel used every peremptory challenge to which he was entitled. This is duly recorded in the minutes of the trial and attested by the presiding judge. Again, the author places Brown in Iowa in August, 1856, although he never entered the State at that time. But why continue? A page of the *Nation* would not suffice to record the other slips which make it impossible to accept this volume, readable as it is, as a reliable contribution to America's history. This is most regrettable because of Dr. DuBois's valuable sociological studies, upon the accuracy of which no doubts have been cast. His last chapter in the book before us is a notable discussion of the race question as it stands to-day in the light of John Brown's sacrifice.

The Battle of Gettysburg. By Frank A. Haskell. Wisconsin History Commission.

This account of the great battle of the civil war, written within a month of the engagement, has had a somewhat singular fortune. Though printed at once, it received little attention until after forty-five years. Then, in quick succession, two editions, somewhat garbled, were published in New England. These have been widely circulated, the narrative so long neglected being declared by high authority to be "far and away the best description of Gettysburg ever written." In view of this recognition, the Wisconsin History Commission does well to reprint the document once more, taking care that the text shall stand as originally written.

Since this long-forgotten story is suddenly receiving such attention, it will be worth while to consider what it is and what it is not. Haskell, a Dartmouth graduate of 1854, settled as a lawyer in Wisconsin, whence he went to the war, falling at last at Cold Harbor, in 1864, colonel of his regiment (the Thirty-sixth Wisconsin Volunteers), and in command of a brigade. His service had been constant and brilliant. In 1863 he was adjutant-general on the staff of

Gibbon, commander of the Second Corps at Gettysburg, and in that capacity went through the memorable three July days. Before the month ended, he set down what he had witnessed and endured in a letter to a brother, without thought of publication, and this letter constitutes the book.

As the personal record of a brave and capable soldier who was in the heart of the battle, the story deserves all that has been claimed; as a history of the event, however, it has inevitable shortcomings. What fell under Haskell's own eyes—and he saw much besides the work of the Second Corps—he describes with surprising accuracy and vividness; in what he reports from hearsay, he sometimes errs and sometimes omits, though he hits the truth more nearly than would seem possible, writing as he did almost at the moment. He represents Meade as having selected Gettysburg for the encounter, and as deliberately concentrating there for that purpose: it is now well established that the meeting of Buford's cavalry with A. P. Hill's corps, which brought on the engagement, on the morning of July 1, was quite by chance, and that Meade fought on ground of which he was ignorant, his plan for making a stand at Pipe Creek coming to naught. As regards the work of the wings, Haskell's report is neither full nor correct. The struggle on the left for Little Round Top, on July 2, one of the crises of this battle, receives slight mention, and the name of so distinguished a participant as G. K. Warren is not once given. The imminence of the danger which the Twelfth Corps warded off on the right, when the Stonewall division pushed to within an eighth of a mile of the Federal rear, on the Baltimore pike, has small appreciation. Haskell's necessarily hasty judgments as to men and events must sometimes be rejected. He denies to Sickles, commander of the Third Corps, both character and capacity, and holds his conduct, on July 2, in taking ground in advance of the line laid down for him by Meade, to be quite incomprehensible; whereas, though Sickles's disobedience may have been inexcusable, he nevertheless had, in the dominance in his front of the crest along which runs the Emmitsburg road, an excellent military reason for feeling uneasy. Our author never mentions the Eleventh Corps except in terms of disparagement; and yet no one circumstance probably contributed more toward the Federal success than Steinwehr's occupation, on July 1, of the crest of Cemetery Hill. The possibility of a counter-stroke, immediately after Pickett's repulse on July 3, does not seem to enter our author's mind, although he states that the Sixth Corps, the largest in the army, well commanded, not hitherto engaged, and burning for conflict, stood right on the field within a mile or two of the disordered Confederate retreat. He sets July 13 as the earliest moment when Lee could be attacked with any hope of success. Then at Williamsport the triumphant Federals held their discomfited foes in a narrow space, with the swollen Potomac behind them. Even here he declares Meade was not over-cautious in delaying attack till he had fully reconnoitred. The result of the delay, however, was Lee's complete escape. The world has come to feel that Meade's caution was untimely, and that the war thereby was sadly prolonged.

Gettysburg's great interest lies in the question it suggests: Why did Lee fail? As a soldier, Lee is indubitably a far greater figure than Meade. How could such a leader fail, in the prime of his power, with an army almost matchless, practically equal in numbers to the adversaries, whom he had repeatedly beaten? Did Lee's own management come short, or were his lieutenants at fault? What brought that proud spirit so low that he fell into depression, begged he might be allowed to resign, and that some younger man might take his place? It is hardly fair to look to Haskell for an answer to these interesting questions.

Haskell's record, therefore, is not at all a satisfactory history of Gettysburg. But as an account of what one man saw and went through in that battle it is perhaps unrivalled. His position was at the centre, in closest touch with the defence of the lines against Pickett's charge, the event in which the battle culminated. While on some minor points he is in conflict with other good witnesses of the event, his substantial accuracy cannot be doubted, while for vividness the description has not been excelled. We mention as passages especially graphic the council of war at Meade's headquarters on the night of July 2, with its pictures of the corps-commanders as they gathered; the repast on the crest, immediately before the Confederate assault, of which Meade, Hancock, Gibbon, and Picasanton partook, chatting meanwhile of what lay behind and before; and, finally, the breasting of the storm of attack. Here, by a miracle, Haskell, the only mounted officer, escaped with merely a severe contusion. His stout horse, though gashed by a shell and with three bullets in his body, did not fail him until the "high tide" rolled back from the "clump of trees."

The Wisconsin History Commission deserves thanks for printing entire and in authentic shape this invaluable document.

CURRENT FICTION.

Martin Eden. By Jack London. New York: The Macmillan Co.

The literary free lance is, as should be well-known, the butt of an unfeeling world. He eats behind the screen in the bookseller's shop, or below salt at the editorial table. Though he work at his unorganized trade twenty hours a day, he is looked upon as rather a shiftless person. People wonder why he does not get a job, and editors return his manuscripts quite as if he did not need the money. It very seldom falls to him to be avenged as handsomely as he now is *in re* "Martin Eden."

Martin came of poor and otherwise unspecified parentage, had a few years of public-schooling, and went to sea with his teens, already an accomplished hoodlum. He had thereafter a varied experience as hand before the mast, stevedore, pearl-diver, smuggler, and general rowdy of adventure. At twenty, happening to spend between voyages an interval at San Francisco, he met a young woman of higher social standing, and fell in love with her. One of two things might have been expected to follow: either the girl would scorn him for his uncouthness, and he, after a period of outer darkness, would find himself a mate of his own class; or he would raise himself to something approaching his beloved's level, develop business ability, and be taken into partnership with her father. Neither of these things did actually happen. Instead, Martin made up his mind to be an author. This naturally seemed a preposterous programme to the girl, who called his attention to the probability that an apprenticeship was necessary to the trade of letters as to any other. Martin did not see this; he began a stiff if random course of reading all by himself, progressing in a few days from Swinburne to Madame Blavatsky and Spencer. The girl advised him to study grammar, and, for a wonder, he took the advice, studying by himself throughout an eight months' voyage, and returning to San Francisco a master of English. Apparently the whole subsequent action takes place within a year or so. Martin wrote an extraordinary amount of copy and sent it the rounds of the principal editorial markets. He knew it was a good deal better than most copy, but for a long time none of it was accepted. This offended his sense of justice, but he kept on. After an immense interval (several months, apparently), one or two manuscripts were taken, and either not paid for, or paid for at starvation rates. A group of lyrics which he sold to a Chicago publication (at a dollar apiece) were horribly garbled by the tyrant at the editorial desk.

Meanwhile he had become betrothed to the girl, against her parent's wishes, against her own better judgment. She

considered herself his superior in every detail but physical strength. She had taken a university degree (in English), and knew the conventional thing to say on "culture" topics. But he refused to accept a place in her father's office, and went on writing copy which she condemned because it was unsalable. Finally she sent him about his business, and it was then that the tide chanced to turn. A book (a philosophical treatise) was accepted by an Eastern publisher, and made a big hit, on the strength of which Martin was able to unload every word of copy he had previously offered in vain. He wrote no more, but contented himself with the ironical occupation of piling up a fortune of a hundred thousand on the strength of work which had been done and despised before his *coup*. Martin was now a disillusioned man, and his startling end was near. In achieving it, he employed the only means by which he could adequately express his contempt for university people, editors, publishers, and the reading mob. Such of the reading mob as may be attracted to his history are likely to discern a good deal of autobiography therein, and to be stirred piquantly by its daring adumbrations of various well-known proper names. But nothing actionable!

The Way Things Happen. By Hugh de Selincourt. New York: John Lane Co.

And do they really happen in the world as they do in this gentlewomanly chronicle? Incontrovertibly they do; indeed, one might accuse Mr. de Selincourt of plagiarizing Real Life, that novelist who sticks at no improbability and to whom no canon of art is sacred. In its mild, low-voiced moralizing, its gracious and circumspect composure, its seemly emotions, this sudden idyl of London recalls the immortal "long, thin love-story of two old maids and an old bachelor," which some of us hold more truly the crown of Thrums than Tommy himself. Miss Paul, a gentle lady who has become a specialist in joy despite loneliness and poverty, meets with a man whose capacity for joy has survived the yet more crucial test of loneliness and wealth. The first time he steps from his six-cylinder Napier at the door of her lodgings, he proposes, after the manner of a prince in a fairy-tale, to carry her off straightway to a future of love and luxury. She is as frank and simple in the confession of her own need of him, but they are barely settled in their new home when he is brought dying from a street accident, and the gentle looker-on at life sees the close of her golden interlude. Her brave struggle to be true to his name for her—"my apostle of joy"—fills the rest of her life and of the book, which her chronicler closes with this fitting epitaph: "A little corner of the world was unquestionably cleaner and brighter and happier because she had lived. That is why her history is worth recording."

It is a pity that so charming a whole should be marred by a somewhat affected style; Mr. de Selincourt's pen picks its way at times with a mincing primness the example for which could never have been set by Miss Paul's feet.

The City of Beautiful Nonsense. By E. Temple Thurston. New York: Dodd, Mead & Co.

The web of this romance is spun quite in the French manner. And, indeed, the reader, from the first chapter, becomes a busy translator, re-turning to France the plot, the geography, the manners, epigrams, and language of this clever and entertaining little idyll. When by chance John and Jill meet at St. Joseph's altar on the eve of the saint's day, on candle-burning bent, it is hard for the reader to regard them as really at home in Sardinia Street Chapel, in London; his fancy carries the actors to Paris. The blended pathos and sentimentality of white-haired parents and young lovers—the wedded wit and humor—these qualities are equally deftly managed, equally Gallic. Even the language has at times the manner of a translation, as in such sentences as these:

> An ideal as high above the conception of life as it is good for the eyes of man to lift.
>
> Since he had come back from Venice the world might have been dead of her.

There is, however, an untranslated sound about "awfully cute," and it is a blow when John thus describes his little white-haired mother. Grammar too often suffers, and proofreading has failed to alleviate; but delightful sayings bubble freely and certain scenes have the lustre of fine enamel.

The Redemption of Kenneth Galt. By Will N. Harben. New York: Harper & Bros.

There is a sort of playfulness occasionally indulged in by well-known publishers, that consists in launching a trashy book with a reputable imprint, to the great discomfiture of the too-trusting public. Harper & Bros., in such a mood, cast forth "Kenneth Galt." So might a staid and ponderous judge cast a paper-filled purse in the street on All Fools' Day, looking to his victims' wry faces for his jest's reward. This book has astonishingly little excuse for being, even in this age of incontinent pens. The plot and characters are as hackneyed as the title, and the quality of the English, which is richly journalese, differs sadly from that of mercy. Even the moral is of questionable value, though the writer's intention is evidently honorable. Kenneth Galt has ruined and deserted a simple village maiden; she has shielded him—at the expense of another man's reputation—through a series of persecutions that are at the present day the specialty of melodrama. He returns, to find her noble, talented, self-supporting, and more beautiful than ever. He yearns for her and for his child, and finally overcomes her natural aversion to his belated proposals of marriage by working on her desire to give their boy an unblemished name. She marries him, therefore, loving and respecting another man, who, we may remark in passing, seems to have done but little to deserve these sentiments. Such are the papers in the April Fool purse. Regarded humorously, the book may be enjoyed; and, after all, one could hardly be prepared to take the contents of such a cover seriously.

CITY GOVERNMENT.

Chapters on Municipal Administration and Accounting. By Frederick A. Cleveland. New York: Longmans, Green, & Co. $2 net.

Accounts: Their Construction and Interpretation. By William Morse Cole. Boston: Houghton Mifflin Co. $2 net.

We are only gradually awakening to understand that the management of a modern municipality is a matter of business. We have devoted much attention to the relative merits of the mayoralty and the commission scheme of government, to the composition of the commou council, to the appointment of certain municipal officials by the State, and the like; but in only one or two of our largest cities, and there only recently, have we come to appreciate that a municipality is a corporation with manifold and complicated activities, and that, to be directed in such manner as to promote the highest public welfare, it must employ the most approved and modern business methods. It is the purpose of this book by Mr. Cleveland, the director of the Bureau of Municipal Research in New York city, to advance this idea. The volume is a collection of magazine articles, and of addresses and reports delivered to various bodies during the last six years. It has the weaknesses which are necessarily found in a work of this sort: it is loosely constructed full of repetition, and in some respects out of date. However, its constant reiteration of fundamental principles will prove not to be a fault if it results in driving home the indisputable propositions so clearly and convincingly set forth. These propositions can be briefly stated.

First, good government is based on accurate knowledge. Legislation which prescribes the powers and duties of officials may be ever so carefully drawn, but it is impotent to accomplish its purpose if the public is without the information necessary to appraise the services of its officials. Secondly, this pub-

licity can be secured in the modern municipality, with its manifold financial, industrial, and social activities, only through a complete scientific system of accounts. Thirdly, such a system of accounts will fail of its purpose if it contemplates merely a scheme of checks and balances which shall protect the public against official malfeasance. Rather must the system be patterned after that employed by the large business corporation, and so present the facts that they will form a basis for wise administrative control. The administrative value of accounts—this is the doctrine urged throughout the volume. The skeptical have only to read the detailed description of the condition of New York's accounts at the time investigation was undertaken by the Bureau of Municipal Research to be convinced of the necessity of some new system that will let in the light. It is certainly a pitiful spectacle when the greatest city in the country is utterly unable to determine from its records whether or not it has exceeded its debt limit.

Chapters are devoted to the consideration of separate departments of municipal administration, such, for example, as the New York Board of Education, hospitals, and eleemosynary institutions. It is to be regretted that the work of the Bureau of Municipal Research is not described in greater detail. Yet its influence is apparent in all the reforms now under way, and its work should soon so commend itself to the body of New York citizens that it will be made an integral part of the city government. Chicago's experience is touched upon and its reform movement described.

The title of Mr. Cole's book accurately describes its contents. It is in no sense a discussion of accounting principles. It is rather a description of the various forms of accounts with detailed instructions as to their use. To be sure, much can be gathered from it concerning the fundamental bases of accounting, but it must be picked up by the way. The volume is written by an accountant rather than by an economist or a student of finance. The distinction between the two kinds of writing becomes clear if one consults, for example, chapter seven on the distinction between capital and revenue. Instead of entering into a discussion of fundamental economic differences, the author informs his readers to what accounts the various items there discussed should be carried. Again, chapter eight, entitled the General Principles of Depreciation, is concerned almost wholly with methods of handling depreciation. For the student of accounting practice, this book, clearly and concisely written, should prove a valuable guide.

Part one covers in an elementary way the principles of bookkeeping, in which the fundamental books and statements are described. Part two, called the Principles of Accounting, treats of Capital and Revenue, Depreciation, and the Balance Sheet. Then follow chapters which apply the principles to various forms of business activity, such as railways, banks, trust companies, insurance companies, factories, and municipalities. The book closes with a brief chapter on Auditing, and with appendices containing information concerning forms and statements.

It is difficult to understand why some of the chapters have been included in a book of this kind. For example, chapter fifteen, called Accounting in Reorganizations, is corporation finance, pure and simple; chapter twelve on Principal and Interest in Valuations is a discussion of the theory of annuities; chapter eighteen on Accounting for Insurance and for Life Tenures is a discussion of the fundamental principles upon which life insurance is based. No doubt, this is all valuable information to the young accountant, but if all these lines of investigation are legitimately within the field of accounting, one must revise one's conception of this growing "science." The best chapter is that on Factory Accounting, which makes a thorough study of the subject of costs.

Essays of Poets and Poetry, Ancient and Modern. By T. Herbert Warren. New York: E. P. Dutton & Co. $3 net.

The nine essays composing this book are highly typical of modern academic criticism in England, in their leisurely movement, sound learning, and moderation, as well as in their inequality and occasional slackness of grasp. Vice-Chancellor of Oxford, President of Magdalen, author in prose and verse, Dr. Warren presents in collected form the occasional criticism—review articles, public addresses, and the like—of nearly fifteen years. All the better qualities of the *genre* he represents appear in the initial essay on Sophocles. The supremacy of the author is illuminated by parallels from many times and tongues. Particularly satisfying is the analogy with Goethe. In conclusion Dr. Warren stakes the case of Greek on Sophocles—a daring but a warrantable challenge to modernizing humanists. The historians, the philosophers, the other dramatists, even Homer, we may have in a fashion at second hand, or in measurable equivalents, but if "the world were ever to give up Greek as a part of the general culture of its most cultivated minds, the greatest treasure it would lose is Sophocles." To this, most Grecians will say amen. All that Dr. Warren writes about the Aristotelian distinction between "frenzied" and disciplined genius is excellent and for our times most salutary.

How the author of the brilliant essay on Matthew Arnold could have written the rest of this volume is a puzzle worthy the attention of Baconian cipher experts. It seems to us the best thing yet written on that most serious of Victorian poets and most dandified of recent critics. Dr. Warren has stated Arnold's paradox fully and frankly and has unravelled it with a clarity, lightness, and sympathy more suggestive of the Rue des Ecoles than of "The High." One realizes as never before the highly unstable equilibrium of Arnold—something quite different from the frivolity of which he was commonly accused. Too much the man of the world to be wholly the poet, he was also too much the moralist to become completely the critic, and perhaps too much the publicist *in petto* to enter far upon either pathway of the muses. Everybody knows that overmuch school inspecting and the *res angustulæ* hemmed him in at every point. But Dr. Warren rightly concludes that Arnold's limitations were rather of temperament than of conditions. He gives the impression of a protean talent that never quite found itself. But it is much to say of any man—and particularly of a vacillator—that in the triple capacity of poet, critic, and pedagogue-theorist, he will not wholly die. Towards Arnold's none too auspicious excursions into theology, Dr. Warren seems to us something short of fair and generous. As mere influence, "God and the Bible" and "Religion and Dogma" probably rank with any similar English books of the half-century. The gist of the latter book is also that of the Modernist movement. In fine, most of the present-day pragmatical religious positions were cheerfully occupied by Arnold a score of years before the term had been invented. All this will doubtless pass, but meanwhile the pioneer deserves his credit.

Six of the seven remaining essays—The Art of Translation, Dante and the Art of Poetry, Virgil and Tennyson, Gray and Dante, Tennyson and Dante, Ancient and Modern Classics—leave a little the impression that the author has said learnedly and gracefully just what might have been expected. In that on Dante and Tennyson, he emphatically overdrives the free horse of personal parallelism. The concluding study, In Memoriam After Fifty Years, is an elaborate defence and exposition along the orthodox lines of Tennysonian commentary. It reaffirms Genung, Van Dyke, and the rest. No critic, we feel, has perceived the real critical dilemma involved. We are told that no one can appreciate the poem, unless he has lived it, while obviously no one who has lived it is quite in a position to pass upon it as sheer poetry. No other very great poem refuses the approach from without. In the case of "In Memoriam," now nearly sixty years away from us, the opportunity for circumspection seems suspiciously postponed. Possibly, it would bear

objective treatment rather ill. In the long run, it may appear that the much berated reviewer who suspected "the widow of a military man" to be the author was less a fool than a knave. At any rate, the "In Memoriam" question is far from closed.

We have considered too briefly these learned and well matured essays. A seasoned reader will find pleasurable matter and suggestive judgments in all; a grudging Epicurean would perhaps hardly venture beyond the second essay. Academic critics and reviewers in America may well yearn for an air in which such casual flowers of scholarship may bloom in so dignified a seemliness.

The Human Way. By Louise Collier Willcox. New York: Harper & Bros. $1.25 net.

"If all the peace and power and joy you can ever win, must be won now, and all fruit of victory gathered here or never"—then, what? To those for whom the ancient religious way of reconciliation with life is no longer available this book commends the quest, in the Ruskinian sense, of the crown of wild olive. It is written apparently by one who has effected some measure of harmony between the desires with which we are born and the knowledge which is thrust upon us; by one who is conscious of the results of modern thought and is not dismayed by them. Mrs. Willcox has what was formerly common enough among women—the religious temperament. She is sensitive to the influence of storied windows richly dight, to the splendor of Latin chants, to the intimate appeal of St. Francis and of Plotinus. But, what is distinctly less common, she also reveals genuine sympathy with the stoical utterances of Marcus Aurelius and Epictetus and with the hard sayings of Eastern moralists. Something of mystical fervor meeting with intellectual candor in a mind disposed to reflection lends to her style at its best a certain masculine energy and distinction. From her chapter on life out-of-doors, inspired, perhaps, equally by nature and Thoreau, this for an example of the poetically vigorous: "The wind is a fine companion for the striding heart." For an example of the plain austere, this from a passage on symbols: "An inspiration toward righteousness must be very vague indeed that does not result in a duty performed, an obligation accepted, or *some kind of commemoration.*"

The "human way" of reconciliation involves a fusion of pragmatism with a refined type of modern epicureanism and cosmic enthusiasm. It disposes of pain and evil by conceiving of creation as the "struggles of spiritual beings to come to higher and fuller consciousness." It insists that "progress is one movement of all humanity, not the separate jaunt of a sect or a party," and it finds, therefore, an uplifting solemnity "in the least task of so great a work as the unification of human endeavor." It rehabilitates the will, affirming the creative power of steadfast desire:

> The world-will is indeed without us, but it is also within. The universe pushes against us, and in the end, will surely overthrow our bodies and we shall lay them down to make some spot of earth greener and more fertile, but so long as the life-breath is in us, the world-will is within as well as without. So long as we breathe we can react against the push of the universe.

So far as Mrs. Willcox deals with fundamental philosophical ideas, she shows clearly the influence of Professor James's thought and even of his style. But her book is primarily an essay on the fine art of living, and in her plea for the decoration of the spirit, she looks to Pater as her master:

> If we will have life repay us, even to the last, when age and decay encroach, then *il faut cultiver son jardin*—we must be unremitting gardeners of life, we must hoard beauties, we must keep records of them as they flit, we must be ever alert to catch the essence of the rare and worthy moment and to prolong its life in memory and in written annals or imitative images.

These lines are little more than a restatement of a well known passage in Pater, and Mrs. Willcox is rather frequent in such reminiscences. This, indeed, gives interest to her work, that it reflects so many different aspects of contemporary thought and feeling. Yet in its total impression, her book seems not secondary and parasitical, but fresh and independent. She has assimilated, composed, and harmonized the elements of culture. She has written with an air of meditation and a note of conviction which awaken the perceptions of the reader to the finer qualities of his experience.

The City of Jerusalem. By Col. C. R. Conder, LL.D., M.R.A.S., R.E. New York. E. P. Dutton & Co. $4 net.

Col. Conder has written this work with the object, as he tells us in the preface, of presenting in a convenient form the results of research and exploration, "which have accumulated during the last half century, but which are scattered in many expensive works, not easily accessible for the general reader." He has cast his material into the form of a history of "forty centuries," based chiefly on "monumental information," and "carried down to the present year." His opportunities for acquaintance with Jerusalem and its antiquities have been unusual. Connected with the Palestine Exploration Fund's surveys from 1872 to 1882, he spent in all three winters in Jerusalem itself, where he had the opportunity of seeing Warren's and Maudeslay's explorations, and, owing to the deconsecration at that period of the Dome of the Rock, for the purpose of repairs, of examining for himself portions of the temple area which the ordinary explorer must take on the word of others.

The changes which have taken place in Jerusalem since that time are extraordinary. Valleys have been filled up, new areas have been built upon, and ancient remains obliterated, so that the best trained scholar of to-day must take at hearsay much of what the man of forty years ago could see with his own eyes. Of course, even then the topography of the ancient city had been seriously obscured, as the excavations of Warren and others have shown, the surface of the Herodian period lying at places forty or even ninety feet below the present surface, while the rock east of the Haram area was 125 feet below the present level of the ground; but the changes in the last thirty years have been greater than those in the 300 years preceding.

Conder points out that, with the exception of the Herodian fortress by the Joppa gate, the temple site, the tower of Antonia, the Tyropoeon valley, and the Pool of Siloam, there is no absolute agreement on ancient sites in Jerusalem. He himself holds, with the older school, against the present dominant view, that the southwestern city, modern Zion, was the original city of David, and that the orthodox Calvary, the site of the Church of the Holy Sepulchre, was Akra. He believes that the *sakhra*, the holy stone enclosed within the present Dome of the Rock, was not the site of the altar before the Holy Place, but the "foundation stone" of the temple, on which the western wall of the Holy of Holies rested. In front of this, eastward, the rock originally descended in steps, so that, viewed from that side, the original effect must have been much like that of a Babylonian stage-tower or *ziggurat*, the Holy of Holies occupying the place of the small shrine on the summit of the latter. The tomb of David was probably the ancient tomb discovered in the orthodox Golgotha, while the real Golgotha was the knoll near the Damascus gate, to the north of Jerusalem. The tomb of Joseph of Arimathea, in which the body of Jesus was laid, was not, however, the so-called Gordon's tomb, which is preserved and shown as such to-day by certain pious but uninformed iconoclasts, this tomb being in reality of a much later date.

The book is interestingly written. The author's views are not put forth in a dogmatic manner, and, while much that he has to say, especially with regard to ancient sites and ancient history, will not be accepted by the modern scholar, the work is full of valuable suggestions, from the author's own observations, and of much interesting and useful information, albeit the reader should at times

check the facts recorded by reference to other authorities. The least valuable part is that which deals with the pre-Herodian history and antiquities. The most interesting and vivid chapter is that which deals with the Jerusalem of the Herodian period; but probably the most valuable portion is the full account of mediæval sites, both Moslem and Christian, because it is precisely this material which it is difficult to find except by exploration of many and often inaccessible volumes and treatises. The perusal of his remarks on forged coins, contained on page 197, which are also true of Palestinian antiquities in general, might be useful to the tourist, if he could be induced to read them before visiting Jerusalem, and so be persuaded to desist from the purchase of "antiques." On the whole, the book is a welcome addition to Jerusalem literature by one of a generation which saw things before they were destroyed.

Lives of the Hanoverian Queens of England. By Alice Drayton Greenwood. Vol. I: Sophia Dorothea of Celle and Caroline of Ansbach. New York: The Macmillan Co. $3.50 net.

The second volume of these lives is reserved, presumably, for the dull and precise Charlotte of George III and for the foolish and badgered Caroline of the First Gentleman of Europe. And we may say now that, if the sequel is as well studied and written as the part before us, the whole will make a valuable work. Miss Greenwood's purpose is evidently to take a middle ground between the formal political histories, which tend yearly to become more documentally dull, and the popular memoirs, which tend equally to flimsiness and bad English. In both sections of the volume—whether her figures move in the courts of Hanover and Celle or in that of England—the political situation is kept well in view, although, naturally, persons rather than institutions are mainly considered. In this respect Miss Greenwood is particularly successful in unravelling the tangled relations of the electorate. She is more interesting here by far than when she comes down to the tragic story of Sophia Dorothea and the brutal Count Königsmarck, which is her real theme. It is a curious commentary on the essential dulness of all that surrounds the Hanoverians that not even the mystery and pathos of Sophia's love can make that tale anything but vulgar. If Miss Greenwood draws out the sentiment of the adventure to wearisome length, she at least uses notable discretion in separating the facts from the volumes of fiction that soon overlaid it. The riddle of Königsmarck's disappearance she does not pretend to solve, although she accepts the strong evidence of foul play. She evidently tries to believe that Sophia was innocent of real guilt, being led to this partly by natural sympathy and partly by her utter detestation of George I and her desire to present him always in the worst light possible.

This animus against George I, which the present reviewer shares quite heartily, forms in a way the dramatic motive of the book. His meanness, vindictiveness, and lack of kingly qualities ("he knows nothing of what is princely," wrote his caustic aunt, the Duchess of Orleans) throw an atmosphere of pity about Sophia Dorothea; they bequeathed "to his descendants, for four generations, the gloomy tradition of family hatred"; they are, if truth be said, the most human quality in the royal annals. To show them as dark and detestable as possible, the onus of the quarrel between George I and his heir is laid entirely on the father's shoulders. George II is made almost an attractive figure, and as a further consequence the nasty feud between George II and Frederick must be charged entirely to the frivolous impertinences of the latter. This is not precisely the historic temper, but it lends interest to Miss Greenwood's pages, while not leading her to make any real distortions of fact. We ourselves are inclined to accept Hervey's scathing ridicule of George the Second's private life as something closer to truth than mere fictitious satire; but if we would make George II more coarse and foolish than he appears to Miss Greenwood, it does not follow that his father was any better than she makes him.

It is rather the fashion for the historian of institutions to write of the first Georges as, on the whole, wise administrators. Such a view can be supported, but it does not affect their character as the heads of society or their influence on the intellectual life of the day. Caroline was a woman of liberal interests and gathered into her court a number of men, like Bishop Clarke, who discussed the religious and philosophical problems of the day. Miss Greenwood does bravely in her attempt to throw some literary value into the Queen's influence; but the result is small. As a matter of fact, one by one the really great minds of the age—in things of the imagination, that is, not of statecraft—drew away from the Georgian circle. A perusal of the correspondence of Lady Suffolk, Lady Sundon, and others of that set shows only too plainly that something more than political Toryism or rancor for favors unreceived, that, in a word, the inherent dulness and vulgarity of the court were responsible for this aversion. It would not be difficult to maintain the thesis that England's gradual lapse through the eighteenth century from her international leadership in ideas to a state of unideaed somnolence was in considerable measure due to the Hanoverian court.

Miss Greenwood, dealing with the Queens rather than the Kings of St. James's, is naturally thrown upon this social aspect of the court. On the whole, she does admirably with a not very entertaining material, although she might have made more of its literary associations, such as they are. We shall await with interest the story of Charlotte and the second Caroline.

Notes.

John Muir's "Our National Parks" is to be issued by the Houghton Mifflin Co. in a "New Holiday Edition," fully illustrated from photographs by Herbert W. Gleason.

Pierre de Coulevain's "Sur la Branche," translated by Alys Hallard as "On the Branch," is promised for immediate publication by E. P. Dutton & Co.

In "The New North," which the D. Appleton Co. promises for autumn publication, Agnes Deans Cameron writes of her explorations, in the summer of 1908, down the Mackenzie River in Canada to the Arctic Ocean. Miss Cameron gives here an account of the Eskimo and other Northern tribes, which should, at this time, have a peculiar interest. There are to be over a hundred illustrations, chiefly after her own photographs.

Dr. Robert M. Wernaer declares himself—in his "Romanticism and the Romantic School in Germany," now in press—enthusiastically in favor of that coming art which he denominates "humanistic," and in which he sees a reconciliation of the love of liberty in romanticism with the restraining influence in classicism. The German romantic movement as a tendency has not been very thoroughly examined by English or American writers: the study of it, which, forming the basis of this new literary essay, will be looked to, on its publication, with a good deal of curiosity. The writer treads here the mazes of Romanticism and Symbolism, Impressionism and Appreciation, Romantic Irony, The Golden Age and the Blue Flower, and Neo-Romanticism (D. Appleton & Co.).

We have referred to the inclusion in the Constable edition of Meredith in twenty-six volumes of the unfinished novel "Celt and Saxon." In his conversation no less than in his fiction and verse, George Meredith expressed pride in his Celtic heritage; "I have not a single drop of English blood in my veins," he once said to Mr. Shorter. The last named writer, who stands sponsor for this bit of anecdote, states also that "Translations from Homer: Experiments in English Hexameters," will be one of the unfamiliar elements of the new illustrated edition promised by Constable. The American publishers of this Memorial edition, Charles Scribner's Sons, announce further that inclusion will also be made of an unpublished comedy. "The Sentimentalist," other fragments, and several critical reviews. There will, too, be collected all the poetry published by the author over his own name, or with regard to the publication of which he gave instructions. One volume, furthermore, will

contain notes of various changes and rewritings, together with the bibliography to which we have made an earlier reference. The new edition will be printed from new type on fine paper, and will be sold by subscription. The illustrations will comprise reproductions of many of the original illustrations which accompanied the novels and poems when published in magazine form, the artists being Millais, Du Maurier, Sandys, Charles Keene, and H. K. Browne. A number of portraits will be added, and pictures of scenes associated by the author with many of his novels and poems. There will also be numerous reproductions of MSS. The first volume of this notable edition will probably be issued in November. The Letters of the novelist, which are to be edited by Lord Morley, will not be ready for publication for a year or more.

Dr. Fabian Franklin, who is writing the authoritative life of the late President Gilman, would be obliged for the privilege of reading any letters from him which are likely to be of service. Such documents may be sent to Dr. Franklin, in care of the *Nation*, and will be promptly returned.

Among the recent noteworthy additions to the Boston Public Library are some 900 volumes belonging to the late Louise Chandler Moulton. A special catalogue of the gift is to be found in the quarterly bulletin just issued, in which it is said that the library is now helpfully and significantly strengthened in the field of English and American poetry and belles letters. Many of the volumes are gift copies containing autographs, and frequently more extended writing of a personal nature. Some of them are copies of limited or numbered editions especially issued for the author's use.

The Macmillan Company has a new edition of Edward Caird's "Essays on Literature," which were first collected in a volume in 1892. The thoughtful and ripe style of the late master of Balliol needs no characterization at this day. While still good reading, it is true that most of the essays, as one comes to them in their new issue, seem somehow not quite vital enough to endure. If there are exceptions to this judgment, it would be the discussion of The Problem of Philosophy at the Present Time, which contains an excellent comparison of the reconciliation effected between religion and sophistry by Plato and Aristotle, with the reconciliation between religion and science needed in 1881, when Caird's lecture was given, and still needed. Even better is the essay on Wordsworth, with its admirable comparison of Rousseau and his disciple.

In his "Inns and Taverns of Old London" (L. C. Page & Co.), Henry C. Shelley, as we need go no further than the sub-title to discover, takes in also the chief coffee-houses, clubs, and pleasure gardens of the metropolis. Indeed, he includes rather too much, for his pages would be more entertaining if he allowed himself space for writing more fully about the houses that are richest in traditions. In a good part of the book he traverses the same ground as Timbs, in his well-known "Club Life of London," and the later work, by its too great jauntiness and rapidity, suffers from the comparison. But Mr. Shelley has a good subject, and his writing certainly cannot be condemned for heaviness. From Chaucer's old Tabard Inn, with which he starts, to Finch's Grotto Gardens, with which he closes, he keeps the reader almost in a state of bewilderment with the names of the great and the witty of England, and with anecdotes of their social life. Though his style is light, there is evidence that he has turned over many books to get his material together.

From Sturgis & Walton comes a new edition of Boswell's "Life of Samuel Johnson," edited by Roger Ingpen in commemoration of the great Cham's bi-centenary The two volumes are in quarto size, with the lines extending across the full page. This, with the weight of the paper, which is heavily sized for the illustrations, makes the books rather fatiguing to hand and eye. On the other hand, the type is fair and large, and the printing careful, with fewer errors in the foreign quotations than is common in English books. In fact, there are only one or two misprints in the Latin and Greek which will arrest the reader's eye—supposing that any reader to-day would be arrested even if a spelling board got control of such quotations. The notes, *variorum* and the editor's own, are judicious and sufficient; the index full and serviceable. The real feature of the edition is confessedly the illustrations. These Mr. Ingpen has culled from all sources, and made them a veritable visualization of the men and manners of Johnson's day. His notes take the form chiefly of brief biographical or topographical comments beneath these pictures, and are commonly much to the point. One error, or omission, we have observed, where the editor says (I, 325) that Bishop Lowth "defended Oxford against the attacks of Gibbon and Priestley," forgetting the famous quarrel with Warburton. The present reviewer is not much enamored of picture books, but must confess that this gallery of faces and scenes, many of them new to him, tempted him to a re-reading of the familiar story, and made him prefer these heavy volumes to his old favorite edition. Johnson and his friends never before seemed to him quite so living, nor that old London quite so real. And he may add, though it is scarcely pertinent to this notice, that as he finished the long record he was more than ever convinced of the greatness and, beneath the bear's rough coat, the tender-heartedness of the Ursa Major. It seemed to him that, if the moral of Johnson's long musing, and talking, on the meaning of man's life were to be summed up in a few words, it would be in the couplet which opens the Prologue so strangely prepared by the moralist for the comedy of "The Good Natured Man":

> Prest by the load of life, the weary mind
> Surveys the gen'ral toil of human kind.

Most readers of Dr. Washington Gladden's review of a long and variously active career ("Recollections"; Houghton, Mifflin Co.) will agree that the best wine is put before them early. The chapters describing the nature of the struggle for livelihood and for education, in a family of artisans and farmers seventy years ago, are more interesting than the later ones. This is not alone because the experience was rarer, but also because it is written out with more vividness. Dr. Gladden's memory of those rude years is not only retentive, but intense and visualizing. The price which poverty had to pay for bread and books is set down with detail that sticks in the mind. For the rest, the "Recollections" are discursive, part autobiography and part contemporary history, and stamped with that broad churchmanship and geniality, combined with the capacity to stand up stoutly for a firm conviction, which we have been accustomed to associate with the author.

Swinburne's life-long idolatry of his Stratford god culminates in a prose rhapsody of some eighty pages, entitled "Shakespeare," written in 1905, but now first published (Henry Frowde). At its best and at its worst Swinburne's critical work was always almost as lyrical in mood as his poetry. He always expressed a lofty scorn for students of the drama who went to their task with no other equipment than ability to count and patience and erudition. But thirty-five years ago, when he contributed articles to the *Fortnightly Review*—articles later incorporated in his "A Study of Shakespeare," 1880—he was himself an industrious student. His earlier utterances upon Shakespeare, as upon the other Elizabethans, though often tumid and ecstatic, were yet sprinkled with passages revealing a fine appreciation, discrimination, and insight. In his later essays, however, he occupied himself more and more exclusively with the expression of his own violent emotion in the presence of masterpieces. His last tribute to Shakespeare is, as nearly as possible, praise with the substance of praise strained away. He begins on a high note of rapture. Only the "supreme and crowning fools among the foolishest of mankind," he asserts, would deride the declaration that it were better to lose all other treasures of human genius and keep this one than to lose this one and keep all others. He does not attempt serious argument of the thesis; he simply passes in review all the plays, and affirms, in twinned epithets charging pair after pair like sea-horses up the foamy crest of his billowing sentences, that each drama of Shakespeare's, with one or two exceptions, is the most divinely and incomparably excellent thing of its kind in the world. He makes, to be sure, some distinctions among the children of the master's mind, but reverently, as a mortal distinguishes the differing glories of the seraphim. Now that Swinburne walks with Shakespeare among the fields of asphodel it is to be hoped that he regrets the intolerable turgidity of style in this effusion. The substance he will scarcely regret; for it is not a criticism—it is a Pindaric ode, a pæan, a *gloria in excelsis*.

J. Keir Hardie, the author of "India: Impressions and Suggestions" (New York: B. W. Huebsch), is an avowed socialist, and one of the leaders of the Labor party in the House of Commons. The subject matter of his book originally appeared in 1907 in the form of letters in the London *Labor Leader*, a Socialist weekly. Were one but to remove the writer's name from the title page, and an occasional reference to English scenes from the body of his book, it would be easy to imagine these "Impressions and Suggestions" to have been written by a native Hindu agitator. As for what Mr. Hardie learned in two months' time about the $150,000,000 India annually

pays as its tribute to England, about "probably not less than 75 per cent. of the harvest [that] goes in taxes," about the 70,000,000 Indians who eat "but one square meal a day," about the government spending 1½d. and one shilling per head, respectively, on education and militarism, about "the partition of Bengal [being] a huge blunder," about 5,000,000 Hindus succumbing in the last ten years to plague, which, "in the main, is due to hunger," and many other conditions of a similar nature—he could just as easily have gleaned all these statistics from the casual speeches daily delivered by Indian nationalists, without taking the trouble to go to India. Even in Mr. Hardie's suggestions for quieting the Indian "unrest," there is nothing beyond a rehash of the stock remedies advanced by Indian writers. But we have a more serious fault to find with this book. Mr. Hardie "went to India to see the people." His book gives the impression to the reader that all Indians are dissatisfied—which is not exactly true. His object in sojourning in India being "to learn of their [the East Indians'] grievances," he did not see much of the great work that Indians are manfully doing all over the land to give woman a new status in society, to implant the germ of modern habits in agriculture and industry, to vitalize the people by reformed education, to refashion the national structure on a less conservative and more approved model, and in a hundred ways to hasten the evolution of the country and the natives. The greatest lack of his book is that it is practically silent concerning these features of the India of to-day, which, in the last analysis, mean infinitely more to Hindustan than do verbal and picric acid bombs.

The "Proceedings" of the third annual meeting of the American Society of International Law, held last April, should command attention for the efficient loyalty of the Society to its declared objects, the fostering of the study of international law and the promoting of international relations on the basis of law and justice. The opening address by President Elihu Root has been alluded to in a notice of the July number of the society's quarterly *Journal*. The reasoning of the other papers is no less forcible. John W. Foster reviews the principal arbitrations by which the United States and Great Britain have sought to settle their differences, concluding that as a rule their determinations have not been judicial, or wholly satisfactory. The fault has lain in the method of selecting the tribunal. Mr. Foster cites the late James C. Carter in confirmation of the principle that a party should no more be a judge in his own case in an international matter than in a private litigation; drawing a lesson from the conduct of Lord Chief Justice Cockburn of England in the Geneva arbitration over the Alabama Claims, where this arbitrator assumed the rôle of advocate as well as judge, and as soon as the decision (from which he dissented) was read, seized his hat, and abruptly withdrew. Furthermore, the more recent arbitration over the Venezuelan boundary has, in result, given but scant satisfaction. Delegate Anderson of Costa Rica argues, further, that international differences should be settled by tribunals composed not of publicists, but of jurists; and Wayne MacVeagh pronounces in favor of the submission of international differences to a judicial tribunal in permanent session at The Hague. The two addresses on the constitution and powers which an International Court of Arbitral Justice should possess, one by United States Senator Burton of Ohio, the other by A. J. Montague, former Governor of Virginia, incidentally touch on the same subject.

Of the other matters discussed in the "Proceedings," we find space for passing notice of one only: that of extradition. Of the three papers on this general topic, the second, by F. R. Coudert of New York, discusses elaborately the question of what so-called political offences are; such offences, in fine, as justify our ministers abroad in affording asylum. He charges that the government, one of whose officials, J. Reuben Clark, jr., had read a paper, had followed no consistent policy. No one who reads Mr. Clark's paper can, however, fail to conclude that he sought to assume a judicial attitude, and succeeded. The paper read by Julian W. Mack of Chicago on this subject comes nearer to supporting the view of Mr. Clark than that of Mr. Coudert. Mr. Mack quotes with high approval from our treaty with Brazil: "Extradition shall not be granted if the offence for which the surrender is demanded be of a political character or if the fugitive prove that there is an intention to try or punish him for a political crime." He contends that it is but fair, in considering the rights of revolutionists, to consider the measures taken by the demanding government, in punishing revolutionists; that if it be known that the demanding government inflicts punishments that are inhuman, that fact should debar the granting of extradition of its fugitives. He alludes to the fact that in the Rudovitz case our government had official documents, even admissions in the reports of the Duma itself, of the commission by officials of the most outrageous crimes; the inference being that the possession of such evidence controlled in the refusal to grant extradition.

From R. Bemporad, Florence, we receive "Almanacco Italiano: 1909." Besides the usual chronological, meteorological, and official features, this handbook contains, for the jubilee, an account of the Italian campaign of 1859. There is an abundance of compact encyclopædic information, under such heads as aeronautics, agriculture, domestic economy, women's industries, necrology, etc. Naturally, these chapters are calculated for Italian readers, but the book, with its many illustrations and diversity of well-indexed data, will not come amiss to any one concerned with current affairs on the Continent of Europe.

Dr. Paul Carus has selected a number of the rhymes of the German mystic Silesius, rendered them into English in the original metre, and printed both German and English on the same page. The volume is an addition to the large library of mysticism, whose constant growth is one of the signs of the times ("Angelus Silesius." By Paul Carus; Chicago: The Open Court Publishing Company).

In its deaconesses the Methodist Church has long had one of the most valuable forms of Christian service for social betterment, and at a conference held at St. Louis last autumn their work and other forms of philanthropic effort conducted under Methodist auspices were discussed. The papers are published under the title "The Socialized Church"; they are edited by the Rev. Worth M. Tippy, D.D., (Eaton & Mains).

In the third volume of "The Historical Bible," on "The Kings and Prophets of Israel and Judah" (Charles Scribner's Sons), Prof. Charles Foster Kent has performed the task necessary to careful study of the Old Testament, but difficult and involved for all but specialists, of weaving together in chronological order the narratives of the historical books and the sections of the prophetical writings which deal with the same period. Only the important passages have been included; and by means of brief introductory notes, which portray the historical situation, the reader is enabled to follow readily the sequence of events and discern the significance of the narratives.

German prose has very little that corresponds with the French *causerie*, yet Georg Hermann has no need of apology in offering the volume entitled "Sehnsucht: Ernste Plaudereien" (Berlin: Egon Fleischel & Co.) to the readers whose sympathies he has won by his novels. The book seems to have been written with no other purpose but that of fixing in the author's mind and conveying to his readers impressions received and conclusions arrived at in odd moments. There is here a genuine sentiment quite rare in the writings of modern Germany, so heavily laden with the supercilious cynicism of a generation drifting towards decadence. In one of his lighter papers, Hermann pleads for childhood; it is not half so essential for the child to become a man as for the man to remain at heart a child. Hermann has no sympathy with monarchy, army, clergy, bureaucracy. He is not even a patriot in the accepted sense of the word, and ventures the assertion: "Napoleon was a bearer of free thoughts, and the Rhine provinces looked upon him not as destroyer, but as deliverer. Leipzig and Waterloo are victories of reaction over progress. Had Napoleon been victorious, they might have been the last battles of history." He protests even against the exaggerated worship of fatherland and mother-tongue. Among other heresies is his doubt of the vitality of serious drama. He sees in the theatre a place of amusement which should never attempt to be anything but play, and in reality does not want to be taken seriously.

"Grosse Männer" is a collection of essays and lectures by Wilhelm Ostwald, published by the Akademische Verlagsgesellschaft, Leipzig, and worthy of careful digestion. The giants of the centuries are, of course, themes for the philosopher's attention, but there is a conscientious, if not always sympathetic, consideration of "the great" in very recent times, and some interesting references to contemporaries and associates of the writer himself, including Zeppelin. Dr. Eliot and Benjamin Thompson are, perhaps, the only Americans mentioned, but Ostwald includes them both among the men who have rolled the world along apace. Thompson (Count Rumford) he credits with having given an early impetus to scientific research everywhere, while in Dr. Eliot's refusal, some years ago, to accept the football autocrats as the proper persons to

bring about reform in American football, he finds a somewhat surprising argument in favor of looking to a new set of men to bring about German school reform. The volume concludes with effective summaries on the woman question, the German professor taking kindly to the idea of woman's advancement—"when properly kept within the ropes." He admits her power to do much that man alone has generally done, but doubts if she can attain to the highest in science.

Few autobiographies contain such a variety of strange adventures and singular reminiscences as "Helene von Racowitza: Von Anderen und Mir, Erinnerungen aller Art" (Berlin: Poetel). The maiden name of the autobiographer was Helene von Dönniger, and she was born in 1845 in Munich, where her father held the post of tutor of the Crown Prince (the future Maximilian II). Her first husband, von Racowitza, she married when she was under twenty years of age. He died soon afterwards in a state of mental depression at having killed in a duel Ferdinand Lassalle—a rival for the hand of Helene. (See "Ferdinand Lassalle and Helene von Dönniger: A Modern Tragedy," by Elizabeth E. Evans; London, 1897). After her first husband's death, she married an actor, Siegwart Friedmann, from whom she was divorced. Some time afterward she became the wife of Baron Serge von Schewitsch, with whom she is now living at Munich. In the course of her most recent matrimonial engagement, the writer of this autobiography has toured the United States with her husband and a theatrical troupe organized by him. She has also assisted him in his journalistic and literary ventures. These memoirs of a fascinating and versatile adventuress bring the reader into contact with her most celebrated contemporaries in literature, music (Liszt), the fine arts (Lenbach and Makart), as well as in politics and social life.

Prof. Edward Heyck has published as volume 29 in the series of which he is the editor, and which is known as Monographien der Weltgeschichte, a popular account of Luther, based on the latest researches, bearing the simple title "Luther." The author is a master of precise and condensed style. The illustrations, 114 in number, are mostly excellent reproductions of contemporaneous pictures.

The death of Henry Charles Lea removes one of the most widely known of American scholars. He was the third of a distinguished family to gain a literary reputation. His maternal grandfather was Matthew Carey, the publisher, who in the last years of the eighteenth century and in the early part of the last had some reputation as a writer, and his father, Isaac Lea, also a publisher, was noted as a naturalist. Henry Charles Lea was born in Philadelphia on September 19, 1825. He never attended school or college, but received, long before the end, the honorary degrees of Harvard, Princeton, the University of Pennsylvania, Giessen, and Moscow. From 1843 until 1880 he was engaged in the publishing business, although in seasons of what he called "intellectual leisure" he undertook historical research. Before, however, he attained his reputation as an historian of mediæval Europe, he wrote several scientific articles and books. Among his earlier productions were essays on "Superstition and Force" (1866) a "Sketch of Sacerdotal Celibacy," which so recently as 1907 was reprinted in London, and "Studies in Church History" (1869). In 1888 appeared the "History of the Inquisition in the Middle Ages," in three volumes, of which a French translation has been made and German and Italian translations planned. Mr. Lea's other works were "Chapters from the Religious History of Spain, Connected with the Spanish Inquisition," 1890; "A Formulary of the Papal Penitentiary in the Thirteenth Century," 1892; "A History of Auricular Confession and Indulgences," three volumes, 1896; "The Moriscos of Spain: Their Conversion and Expulsion," 1901; "A History of the Inquisition of Spain," four volumes, 1906-7; and "The Inquisition in the Spanish Dependencies," 1908. He found time also to engage in labors of social reform, and he was elected president of the Philadelphia branch of the American Social Science Association. In 1871, he helped to organize the Citizens' Municipal Reform Association, the aim of which is and has been to bring the public business to the same degree of efficiency and economy as is obtained by a private corporation. He was also president of the Reform Club and was an early advocate of civil service reform. In 1889 he made a liberal contribution to the Philadelphia library, and in 1892 he aided largely in founding a department of hygiene in the University of Pennsylvania by erecting for it a laboratory.

Brevet-Col. Theodore Ayrault Dodge, U. S. A., retired, died at Versailles, October 26, in his sixty-eighth year. He was born at Pittsfield, Mass., and was a graduate of the University of London and of the law department of Columbian University. His military education he received in Berlin under Major-Gen. Von Frohreich of the Prussian army. He served as a volunteer throughout the civil war, receiving several wounds, and afterwards served in the Bureau of Enrolment in the paymaster's office, and in the regular army. He was a distinguished military writer, being the author of a "History of the Art of War," in twelve volumes; "The Campaign of Chancellorsville"; "Bird's-Eye View of Our Civil War"; "Patroclus and Penelope"; "Great Captains," and "Riders of Many Lands."

Lieut.-Gen. Oliver Otis Howard, U. S. A., retired, a distinguished veteran of our civil war, died at his home in Burlington, Vt., October 26, in his seventy-ninth year. He was a graduate of Bowdoin College and of the Military Academy at West Point. After the civil war he served in the Seminole campaign in Florida, and, at West Point, as a professor of mathematics. He was largely instrumental in establishing Howard University at Washington, and has served as its president and trustee. Gen. Howard was long a popular lecturer, and was the writer of a number of books, among them "Life of Agenor de Gasparin," "Life of Zachary Taylor," "Isabella of Castile," "Fighting for Humanity," "Our Wild Indians," and "Autobiography" (two volumes).

A former vice-president of the Société des Gens de Lettres, the novelist Charles Diguet, has died at Mantes, *ætat.* seventy-three years. He was born at Havre, and began his literary career with the publication of "Rimes de printemps." He was the author of many books on a variety of subjects; one of those on hunting, "Mémoires d'un lièvre," was crowned (1885) by the French Academy.

Science.

The Foundations of the Origin of Species. By Charles Darwin. Edited by his son, Francis Darwin. New York: G. P. Putnam's Sons. $2.50.

This interesting volume comprises two essays written respectively in 1842 and 1844. The first is the more significant, and especially suggestive of the wonderful mind of the man; indeed, the second, while much longer, is avowedly only an elaboration of the 1842 sketch. This first essay, covering about fifty pages, while only now given to the public, was printed in an *édition de luxe* earlier in the year for presentation to the delegates of universities and societies who attended the celebration at Cambridge of the centenary of the birth of Charles Darwin. An account of the successful programme of this interesting occasion has already been given in the pages of the *Nation* (July 15). The significance of the occasion was enhanced not only by the presence of Darwin's three sons, but by the giving to the world of this unpublished digest of the principles, embodied seventeen years later in the most famous book of the last century. The finding of this was rather dramatic—a small package of manuscript being unearthed in a cupboard under the stairs at the house at Down long after the death of Darwin. We have had volumes tracing the growth of the ideas embodied in evolution, from the days of Anaximander and Aristotle, but in this short essay we first realize the last steps which led to the fully formed presentation in the "Origin." The editor has gone carefully over his father's manuscript, clearing up abbreviated sentences, tracing out almost illegible words, even reproducing phrases which have been crossed out and rewritten. From a perusal of this we realize more fully than ever before the great patience and the powerful concentration of thought which this pioneer brought to bear on the thousands of loose facts at his command. One by one they fell into place in the mosaic of his mind, and gradually formed the complete image which was given to the world. Almost nothing in his biography brings us into such intimate appreciation of Darwin's methods of work as this stray outline or "Foundation," cast aside and never intended for publication.

In regard to the elaborated second essay, while showing more finish than the hurried and condensed manner of the 1842 sketch, it yet gives the impression of an uncorrected MS. rather than of a proof-read book. It lacks much of the force and conciseness of the "Origin,"

but is interesting as showing a "connecting link" of reasoning between the generalized theories of the first sketch and the splendidly rounded-out material in the "Origin."

In a letter to Mrs. Darwin, the author requests that, in the event of his sudden death, she will devote £400 to the publication of this second essay, thus showing a reluctance to publish it in its present state except as a final necessity.

The "Physical Laboratory Handbook," by George A. Hoadley (American Book Co.), and the "Laboratory Manual," by Charles F. Adams (American Book Co.), are designed respectively to accompany the authors' well-known preparatory texts. There is not much to choose between them, as the subject matter and its treatment are pretty much the same in each. They are fairly good, and will answer the needs of the ordinary school. It is something of a pity, if physical laboratories are to be maintained in preparatory schools, that the same excellence is not attained in this part of the subject as in chemistry. The reason is probably that physics does not lend itself readily to elementary laboratory instruction without considerable expense.

Ernst Haeckel, as the first work since his retirement from the Jena professorship of zoölogy, publishes a brochure entitled "Das Weltbild von Darwin und Lamarck" (Leipzig: Kröner). The purpose is to contrast the investigations and aims of the great English and the great French defenders of the evolutionary theory. He shows that the exact scientific methods of the author of the "Origin of Species" and the more or less fantastic ideas of the author of the "Philosophie zoölogique" have been the main facts in the popularity of the former and the comparative unpopularity of the latter. Haeckel's brochure is partly a plea for a better recognition of the merits of Lamarck.

The third edition of L. P. Gratacap's "Geology of the City of New York" (Holt) is enlarged, and is, besides, improved in appearance over its predecessors. An introductory chapter on North American geology in general has been inserted before the local descriptions, and much fuller treatment is given the boroughs outside of Manhattan Island. The reader for general information, the engineer seeking local details, and the teacher needing instruction and guidance for excursions with classes, will all find much of interest and value in the book. Since, however, this work is primarily intended for readers not specially skilled in geology, the treatment should have been somewhat simpler and clearer than we find it. There are, too, occasional lapses into a rather pedantic style, where such words as salic, femic, anamorphic, katamorphic, crenitic, and the like will only serve to mystify readers not learned in the science. Perhaps, if a fourth edition is called for, the author may be expected to remove these difficulties and to add an index.

News comes of the death of Hugh Blackburn, professor of mathematics at Glasgow University, 1849-1879. He was, with Lord Kelvin, an editor of Newton's "Principia," and was the author of a treatise on trigonometry.

Drama.

The production of Stephen Phillips's tragedy, "Herod," in the Lyric Theatre on Tuesday evening—whether it prove a financial success or not—may safely be set down among the most important and interesting dramatic events of the current season. All intelligent playgoers owe a debt of gratitude to Mr. William Faversham, whose praiseworthy ambition has given them an opportunity of witnessing a work of such fine literary and dramatic quality. To say that the representation was in every respect ideal would be a grave exaggeration, but it was generally adequate, often excellent, and in places exceedingly impressive. No prolonged description of the piece itself is necessary at this time. All students of the modern stage have been familiar with it, in printed form, since it first excited the admiration of the English critics some years ago. It is genuine tragedy of a very high order, dealing with certain incidents in the reign of the great Herod—connected with the killing of his wife, Mariamne, and her brother, the high priest, Aristobulus—in a vein of rare and passionate poetic imagination, but with sufficient regard for the known facts of history. The central figure of Herod, tempestuous in love, crafty and bold in council, swift and remorseless in suspicion, and imperial in the madness of despair, is depicted with vivid power. Mr. Faversham is incapable as yet of interpreting the king in the full measure of his heroic proportions, but his impersonation was intelligent, consistent, and picturesque, and marks an upward step in his professional career. It was deficient chiefly in elocutionary skill and in dignified gesture. The Mariamne of Miss Julia Opp was a distinctly capable performance, as was the Sohemus of Burton Churchill and the Salome of Olive Oliver. Mr. Cooper Cliffe did not grasp the possibilities of the part of Gadias. The blank verse, as was to be expected, proved a stumbling block to most of the performers, but if the rhythm and emphasis suffered, the meaning, as a rule, was preserved. The piece was lavishly and tastefully mounted, and several of the stage pictures were uncommonly beautiful. A more striking tableau than that of the stricken Herod standing rigid beside the bier of the dead Mariamne is not often seen upon the stage. The house was crowded, and the applause frequent and hearty.

The production of an English version of Henri Bernstein's play "Israel" in the Criterion Theatre, on Monday evening brought disappointment to those who expected to find in it a fresh and vital treatment of the Anti-Semitic agitation. The piece must have suffered badly at the hands of the adapter. At all events, in its present shape, it comes to a most feeble and conventional conclusion. Actually, the play is built around a particular situation, and probably originated from it, or rather from the idea that suggested it. The importance of it is far more theatrical than sociological. Thibault, a young French aristocrat, distinguished for his abilities, his charm, his energy and his hatred of all Jews, is resolved that the object of his especial detestation, one Gutlieb, a rich Hebrew banker and philanthropist, shall be socially obliterated. Therefore he insults him publicly in his club, fully intending to kill him in the duel which must follow. He thinks that he will thus do the Christian world a service. But his mother, the proud, venerated Duchess de Croucy, intervenes, and from her he learns, after an excruciating interview, that he is illegitimate, that the loathed Gutlieb is his father, and that he himself is also, therefore, a Jew. It is upon the scene in which this confession is made, or rather extorted, that the success of the play here must depend. Undoubtedly, the situation is a harrowing one, and it is elaborated with great ingenuity. But it is this very ingenuity, with all its transparent artifice and its multiplication of melodramatic device, that detracts from its tragic significance and its artistic value. The whole contrivance smacks too much of the theatre to impress any but the most unsophisticated playgoer with a sense of reality or reasonableness. In Paris, this scene was enacted by Madame Réjane, with great subtility and eloquence of feeling, and the effect was remarkable. The part of the mother is played here by Miss Constance Collier, a far less accomplished actress, whose effects are due more to physical prowess than intellectual or artistic suggestion. She roused a storm of applause by a fine burst of passionate abandonment. But all this has very little to do with Anti-Semitism. This, indeed, is discussed at great length in the first act, but with a careful observance of opposing prejudices which is more like managerial astuteness than philanthropic purpose. The latter certainly had nothing to do with the happy ending, in which Thibault, after saying that nothing was left for him but death or the cloister, finds happiness in the arms of a devoted girl, plainly provided as an afterthought, to secure a blissful curtain.

Rudolph Besier's "Don," which has been secured by the New Theatre management for New York production, has attained success in London, and seems to be a bright and original piece of work, with a significant moral behind its humorous fancies. Stephen Bonnington is full of generous impulse and apt to act upon it, without weighing consequences. Moreover, he is fearless. When, therefore, he hears that a young woman of his acquaintance is treated abominably by her husband—a dour old Second Adventist—he promptly carries her off to his own home, amid a variety of suspicious circumstances, and hands her over to his mother. With the arrival of the outraged husband, the situation becomes semi-tragic; but it does not end so. The rash hero explains to his betrothed that it is his love for *her* that has made him so chivalrous an admirer and defender of her sex; he finds a way, too, to deal with the angry husband. A generous idealism underlies the whole merry piece, and differentiates it from our imported farces, made over from French models.

The latest play by Björnstjerne Björnson is entitled "When New Wine is in Bloom," and the theme is the glorification of love and youth. A chorus is employed, as in classic drama, and serves as the background to love episodes, one being the reunion of a husband and wife who have lived apart. The play will be staged in due course at Copenhagen, the famous Danish actress, Mme. Hennings, playing the leading part.

On the withdrawal of the spectacular

"Révolution française" from the stage of the Théâtre Sarah Bernhardt, the "Jeanne d'Arc" of Emile Moreau will be substituted. Rehearsals of this latter play are now in progress, and are said to have inspired the participants with an unusual degree of enthusiasm.

A chatty and very personal little book, entitled "Eugène Scribe, d'après sa correspondance avec Ernest Legouvé," has been compiled by Charles Martel and enlightens the reader as to the methods of dramatic collaboration the correspondents used. The construction of "Adrienne Lecouvreur," of "Les Doigts de fée," of the "Bastille des dames," etc., is treated in anecdotal style.

"Suzette," the new piece, by M. Brieux, now seen in Paris at the Vaudeville, is to be followed, in due season, by a play in four acts by M. Nozière. The playwright has drawn upon the novel by Paul Reboux, "La Maison de danses," for dramatic material, and his third act is described as being "une représentation dans la Maison de danses," with a hundred *figurants* in addition to the regular cast.

Music.

Standard Concert Repertory. By George P. Upton. Chicago: A. C. McClurg & Co. $1.75.

Mr. Upton is not particularly happy in the choice of titles for his books. Last year he prepared the "Standard Concert Guide," a handbook of symphonies, oratorios, cantatas, and symphonic poems, uniting under one cover, together with some new material, the contents of his earlier "Standard Symphonies," "Standard Oratorios," and "Standard Cantatas." There was a gain in convenience, undoubtedly. Now he appears with another volume in hand containing brief analyses of overtures, suites, symphonic poems, rhapsodies, fantasias, etc., in the modern concert repertory. Such a volume was much needed; but why call it the "Concert Repertory"? Would it not have been possible to find titles indicating that the "Guide" related to longer works, the "Repertory" to the shorter pieces?

There are no other reasons for finding fault with Mr. Upton's new book. The works chosen for analysis are selected judiciously and with catholic taste; the analyses are brief, lucid, and free from technical jargon or pedantic "parsing"; and concert-goers will be able to find here information regarding most of the concert pieces they are likely to hear. If anything, Mr. Upton is too liberal; there are a dozen or more compositions in his list that might have been left out without being missed. There are pictures of fifty-seven composers, three on a page, and as the arrangement is alphabetical, it results in some odd groups, such as Beethoven-Balfe-Balakireff, and D'Albert-Auber-Bach. An introductory chapter treats briefly of the different kinds of overtures and suites. It is interesting to note the names of the composers represented by the largest number of works: Beethoven, Berlioz, Dvorák, Grieg, D'Indy, Mendelssohn, Tchaikovsky, Wagner, Weber.

America gets not only the greatest European singers, but also the players, the best of whom give more concerts on this side of the Atlantic than on the other. Prominent among these best players is Fritz Kreisler, who is with us again, after an absence of a year. He gave his first recital last Saturday afternoon at Carnegie Hall, before an enthusiastic audience which filled the auditorium; and once more he showed that he has no superior, probably no equal, among living violinists. He shares the popularity of Paderewski, with whom he also has in common the contempt for mere display, the technical mastership, and the subjection of technique to expression. He is the most emotional of violinists, as Paderewski is of pianists; and he knows how to fill the hall without making the slightest concession. The ordinary violinist and pianist often wonder why high-class concerts do not pay as well as vaudeville or musical comedy. As a matter of fact, they do pay as well if the music is as adequately rendered as the low-class music usually is. The success of Kreisler and Paderewski proves this. Kreisler's programme included, as usual, some of those quaint eighteenth century tunes which he has exhumed. A Handel sonata and a Viotti concerto were also on his programme. He gives a second recital this week, on Saturday afternoon.

Oscar Hammerstein's preliminary season of what he called "educational opera" comes to an end at the Manhattan this week. It was confined entirely to French and Italian operas, which the public is supposed to favor particularly; but although the orchestra, chorus, and scenery were the same as those employed during the regular season, when seats cost more than double the prices asked during the preliminary weeks, the pecuniary results were so unsatisfactory that the manager has decided not to repeat the experiment. Some of the leading singers were quite good; but the New York public has shown many a time that it wants nothing but the best, and is willing to pay any price for that. It was also, no doubt, a mistake to begin so early; September and October are never likely to be good opera months here. The regular season at the Manhattan will begin on November 8, with the first performance in America of Massenet's "Hérodiade." After the American season, Mr. Hammerstein intends to take his company to Paris. The Metropolitan company also has announced that it has secured a theatre in Paris for a series of Italian performances next spring. With Caruso to head the list of singers there can be no risk involved in such an experiment. If it succeeds, the German wing of the Metropolitan will in the following spring give the Parisians a chance to hear the real Wagner.

Edward MacDowell wrote mostly for piano, voice, and orchestra. His admirers, however, have converted some of his compositions into chamber music. The latest of these arrangements consists of five of the "Woodland Sketches," which Julius Klengel has adapted for violoncello and piano. Arthur P. Schmidt of Leipzig and Boston, who publishes this novelty, has also recently printed a piano quintet by Mrs. Beach and a trio and a suite by Arthur Foote.

The first new opera of the present season of the Opéra Comique—which is the twelfth season of M. Carré as director—will be "Chiquito." These "scenes from Basque life," after Pierre Loti, have for their librettist Henri Cain, and the music is by Jean Nouguès. This will be the first opera of the composer to be sung in Paris.

Art.

A NEW EXHIBITION OF OLD MASTERS.

London, October 8.

The National Loan Collection at the Grafton Gallery is the first important show of the season. It is called "National," no doubt, because its profits are destined for the National Gallery Funds. The need is urgent. Love for art is not one of the average Briton's qualities, and for long he bore the loss of masterpieces with decent composure. The government's grants to the national collections are less than small—they are miserly; and private bequests do not go very far in an era of tremendous prices. The only hope seemed to be in some action on the part of the public, and already the National Art Collections Fund has been established on the lines of the French Society of the Friends of Art. The excitement last summer over the Duke of Norfolk's sale of his Holbein—the Duchess of Milan, which he had loaned to the National Gallery for so long that it was looked upon as national property—drove into a panic a good many people who had never before been interested in the problem. I believe that the present exhibition had then already been planned, but as it was to be held frankly "in aid of National Gallery Funds," the excitement probably attracted more attention to it and made it easier to obtain the loan of important works.

It is appropriate that the show should be of the old masters which its object is to save from the clutches of the barbarian. There has been no attempt to represent any one school or period, but rather to arrange a series of masterpieces of many schools and periods, and to supplement these with an equally fine series of drawings. The number in both cases is limited to about a hundred, for it is beginning to be understood that it is better to show a few pictures well than many badly. The selection, on the whole, is admirable, as it ought to be, the Royal Academy having long since prepared the way. The one great work the Royal Academy has accomplished in the last half century

should not be forgotten, whatever its summer shows may be, for the winter exhibitions of old masters have often been of the utmost interest and splendor, and, if the more recent have proved less remarkable than the earlier, it is not to be wondered at. The supply of old masters in the country, though large, is not inexhaustible. The majority of those shown at the Grafton are already well known, and the great pleasure is in the opportunity given to see again masterpieces which, belonging to private collections, it is not always easy to see.

I confess that I went to the Exhibition with some misgivings. Pictures have seldom looked well in the Grafton, hitherto an over-decorated and poorly-lighted gallery. However, several members of the committee now in charge are also members of the International Society, and have inherited the Whistler traditions of arrangement and hanging. The gallery has been redecorated, and a much quieter scheme invented for it. The walls are now covered, in two rooms with gray, in the other two with a dull reddish gold that makes a neutral background. The pictures are never crowded, and each has around it the space which is as important to a framed painting as the margin to a print.

No strict chronological order has been observed: you must go into the third room before you come to the earliest work. Even here there are not many primitives, undue prominence not having been given to "the cock-eyed madonnas" in which the maker of attributions delights. Even as it is, the carefully compiled catalogue seems to challenge the Morellian to combat. After all, however, the masterpiece remains a masterpiece, and new attributions would not lessen the beauty of the Holy Women at the Sepulchre, now attributed to Hubert Van Eyck, from Sir Frederick Cook's collection. The color would not lose in brilliancy nor the design in fine dramatic lines, the towered and turreted mediæval town against the luminous sky would be as picturesque. More beautiful still and one of the most beautiful works in the whole collection, is the Holy Family with Donors by Carpaccio, lent by Lord Berwick. You almost resent finding it in a gallery, so clearly was it meant to decorate a certain definite space. The great Venetians who came later seldom exceeded the splendor of this harmony in brown and gold, seldom surpassed the rhythm of the lines and masses. The road winds along the hilly background, and down it the little figures of the Magi, each in rich robes on a richly caparisoned horse, are seen as they come riding from out of the distance to where the child lies low on the ground between the kneeling mother and the kneeling donors, a man and woman, who are devoutly worshipping; that both are portraits you are sure without knowing their names or who or what they were. The subject was one only too often painted by Carpaccio's contemporaries, but the master could create a masterpiece out of the most hackneyed theme. A Virgin and Child by Crivelli has not a little of the same decorative sumptuousness of color, and one can but feel how it must have glittered and glowed and shone in the place above the altar which originally it was intended to fill. These old masters never would have allowed their work to be seen, as we see it, separated from the surroundings for which they designed it, for they were, above all things, decorators. In this same room there are two portraits of the greatest distinction, about which there has already been much discussion: attributed by the present catalogue to Giorgione and to Titian, respectively. The first, known as the Temple-Newsam Giorgione, is the portrait of a youngish man; his face, clean-shaven, has both charm and power, and his pose, as he stands behind a parapet, his hat in one hand, his gloves in the other, is of great dignity; while the color throughout is quiet, with beautiful passages of sombre red in the sleeves. The Titian, which came up for sale three years ago at Christie's, represents an older man, whose face has less charm but whose pose is as dignified, and who wears a wonderfully painted fur-trimmed cloak. He has been described as Lorenzo de' Medici, but it makes little difference who he is, or who actually were the painters of two portraits of such rare nobility and distinction.

The many other pictures in this same group—by Luini, Ghirlandaio, the Maître des Moulins, Fra Lippo Lippi, Bellini—all have their interest, if not always artistic at least historical. There is another Giorgione, the subject of even hotter dispute, the large Adulteress Brought Before Christ, lent by the Glasgow Corporation; although the most disputed Giorgione of all is the Giovanni Onigo, in the adjoining room, already referred to by the critics as "the problem picture." There are also two characteristic Raphaels, the Cowper Madonnas, as they are called—characteristic, that is, of the popular Raphael; they might hang as pendants to the Sistine Madonna. Near them, however, is the group of Cardinal Ferry Carondelet and his Secretary, with such strong individuality expressed in each of the figures, even in the third who peers out from the shadows of the background, that, like his portraits in the Uffizi, it makes one wish that Raphael had left his followers to paint the Madonnas then in demand and had himself kept to portraiture.

The most distinguished feature of the largest room is a wonderful wall of portraits by Rembrandt and Frans Hals, only five in all, but each a masterpiece. The Man with a Hawk, from the Duke of Westminster's collection, so superb in its beautiful golden glow, and the Man with Close-Cropped Hair, loaned by Sir Edgar Vincent, that looks as if painted with a brush steeped in light, are the Rembrandts, and are so well known that it would be useless for me here to do more than mention them. The three Halses come from the Kann collection. Two are of men, both half-lengths and both severe in color, the black of the dress lightened only by collar and gloves. The third is of a woman, and is no less severe, the collar, cuffs, cap, and a handkerchief in her hands the sole relief to the severity. They are catalogued simply as Portrait of a Man, Portrait of a Burgomaster, Portrait of a Woman. But the portraits would gain nothing in interest if the name of each subject had survived. These men and women live for us as surely as if they had been identified. They have character in their faces, their pose, the way they carry off the fashions of the period; beauty in the expression of this character, the vivacity of the handling, the sense of design with which each is placed on the canvas. Hals was no less a master of decorative design than Carpaccio, though he used it for so different a purpose. The vigor of Hals's work sometimes blinds one to the delicacy of his detail. After this series of portraits, the Van Dycks on the opposite wall strike you as artificial and lifeless, and, indeed, finer examples might, without much trouble, have been chosen. Reynolds's Sterne, too, loses by the comparison; El Greco's portrait of his daughter seems but a decorative arrangement, and Goya's Duke of Wellington but the Spaniard's failure to paint an Englishman. Though portraits predominate, there is one beautiful though not entirely untouched Ver Meer, Soldiers and Laughing Girl, one of the gray interiors he loved, with two figures, and on the wall a marvellously painted map. In a large canvas like Rubens's Queen Tomyris with the Head of Cyrus, one looks for other qualities than Ver Meer's tenderness of tone and exquisiteness of surface; one finds them, too, in his tremendous vigor, dramatic action, swaggering pose, elaborate composition — the elaboration, perhaps, too evident—splendor of color. The flamboyancy and vitality of it put to shame the *machine* of the modern weakling. The handling is so masterly that one is inclined to agree with the critic quoted in the Catalogue, that all the principal figures are by the master himself, which cannot often be said of the pictures Rubens designed on so large a scale. Velasquez is not very well represented. His Water Carrier and Old Woman Frying Eggs are early works, their interest mainly biographical, and the small Portrait of a Man, never previously exhibited, is certainly not to be ranked with many of the other paintings by

him, owned in England. More than one of the early Italians could have been spared for the masterpieces of the great Spaniard, and it is hard to understand the committee's apparent indifference to them.

The English pictures, with a few exceptions, have been hung together in the small octagon room, the first to be entered. Here, Reynolds towers, making up in a measure for the disappointment in his Sterne, where it faces the great Dutchmen. The most important pictures by him are the two large groups of The Dilettanti Society, painted with a straightforwardness not invariably inspired by the women who posed and languished for him. In both the color is perhaps a little forced, keyed up too high in an apparent and quite unsuccessful effort to vie with the golden glow of Rembrandt. But the figures are vivid and well arranged, and all the details are painted with a joy in the work that is unmistakable. These pictures should have a place in any and every exhibition where the eighteenth-century British painters are hung with the old masters of whom they were students and followers. I have space only to add that Gainsborough and Lawrence are also included; that Chardin, Nattier, and Watteau are represented, that El Greco's extraordinary Supper in the House of Simon hangs with the portrait of his daughter; that there are several of Rubens's fine sketches, and that Tiepolo appears as his rival with an enormous Finding of Moses, in color and design less flamboyant and vigorous, but subtler and, used as mural decoration, probably more decorative. If there is no landscape at all, it is simply because some sort of limit was necessitated by the available wall space.

No such limit was imposed in the selection of drawings, which almost all come from J. P. Heseltine's collection and are of the French school. The Claudes are many, chiefly in pen and sepia on white or tinted paper: notes, or rather elaborate drawings, of broad landscapes with classic buildings and placid waters, with goatherds and goats, with large graceful trees just where trees should be, and skies filled with light. Most of them are carried almost as far as his pictures, a few are simply studies and not one more marvellous for the etching than the carefully worked out two ships in a storm, The Shipwreck, a proof of his scrupulousness as student as well as skill as draughtsman. The Watteaus, dainty, and learned in their daintiness, are still more numerous. There are fewer Fragonards, but these few have no less grace and even greater freedom, and the slightest are proofs of the invariable knowledge of his craft and sense of style. There are also Bouchers, Largillières, and Lancrets, and originals by Gravelot and Moreau le Jeune, who are better known in engravings; and, finally, this marvellous collection is brought down to David and Bailly, Ingres, and Géricault.

The Exhibition will remain open four months. It seems one of the little ironies of life that the Englishman who patronizes it will be giving freely to the government in alms, even while the country is fighting over the means to force him to give to the government in tax. N. N.

"The Art of the Belgian Galleries," by Esther Singleton, is the ninth volume in the Art Galleries of Europe series, and is to be issued by L. C. Page & Co. on October 30.

Five more volumes in the International Art series are promised for autumn publication. Edgar Degas is treated by Georges Grappe, the Great English Masters by Fritz Stahl, Eugène Delacroix, and Auguste Rodin by Camille Mauclair and Gustave Kahn, respectively, while Fritz Boehle, a young German artist of remarkable distinction, whose work is not yet widely known, is the subject of a volume by Rudolf Klein (Unwin).

The frontispiece of the September number of the *Burlington Magazine* is a Madonna and Child, by Fra Angelico, recently purchased by J. Pierpont Morgan from the collection of the King of the Belgians. It is said to be "the only single picture known of the painter's last Roman period," and should be a revelation, to many, of the serious artistic accomplishment of the Frate, while it has all the devotional feeling and sweetness of his earlier works. The rest of the number, both text and illustrations, is devoted almost wholly to the minor arts, such as French Renaissance furniture, Sheffield plate, Kentish chests, crewel-work hangings, and Oriental pottery. The important exception is an article by E. B. Havell on "The Symbolism of Indian Sculpture and Painting."

Volume XXVII of the *International Studio* (John Lane Co.), including the numbers for July, August, September, and October of 1909, is "true to type," being something halfway between a popular magazine and a serious technical publication. It is profusely illustrated, has a patchy air which comes from short articles and a poor decorative sense in the printing of the page and the spacing of illustrations, and deals with current art production, good, bad, and indifferent, pretty fully. It is not quite popular, because it prefers art that is new or startling or significant to that which is pleasing; not quite serious, because its criticism is seldom written by persons of real competence and never written for real students. What it presents, at best, is a popular account of unpopular art, and where the art is good as well as unpopular (which is sometimes the case, though not so often as the unpopular artists would have us believe), such an account has its uses.

A Greek marble, "the most beautiful statue in the world," has been snatched from "the envious greed of foreign millionaires" and from "finding a place in some enormous collection of recent antiquities and bastard chefs-d'œuvre," and placed in the Museo delle Terme, at Rome. This statue, popularly known as La Fanciulla di Anzio, represents a girlish figure standing turned a little towards the left, her head slightly bent downward, her hair knotted over the forehead. She wears an *himation* and a *chiton*, which falls, leaving the right shoulder bare. She seems intent on some objects on a large disk which she supports with her left hand. The attitude suggests the presence of another figure. It is not clear whether she represents a priestess or some mythological character, but she is full of the warmth and truth of beautiful youth and of fine Attic grace. This statue was discovered in December, 1879, when a heavy storm caused a landslide in the Grotto of Nero on a farm belonging to Prince Ludovico Aldobrandini-Chigi, at Anzio. The waves exposed a wall of reticulated bricks, with a niche, covered with stucco, in which this statue was still standing. It had been seen by only a few foreign archæologists until an application for permission to export called the government's attention to it, and resulted in its purchase (it is reported) for 450,000 lire.

From Paris comes news of the death of Henri Bellery-Desfontaines, a landscapist, and of Edmé Antony Paul Noël ("Tony Noël"), a well-known sculptor. M. Desfontaines was but forty-two years of age, and was an artist of varied talents. Tony Noël was a professor at the Beaux-Arts, and a former recipient of the Prix de Rome, being a pupil of Lequesne, Guillaume, and Cavelier. He was in his sixty-fifth year.

Finance.

THE BANK OF ENGLAND AND WALL STREET.

Last Thursday's advance of the Bank of England's official discount rate to 5 per cent. was one of those events which cause a flutter of interest throughout the financial world. In the first place, a 5 per cent. English bank rate before the close of October is unusual. Except for 1906, this is the first year in which the rate has gone to that figure at such a date since London's "Boer War panic" of 1899, and 1899 was the first year in which it had been reached in October since the "Baring panic" of 1890. Even this, however, is not the chief consideration. The Bank of England rate has been raised this month in three successive weekly advances, from the 2½ per cent. rate which prevailed up to October 7, to the 5 per cent. rate of last week. So rapid and violent an advance, though not unparalleled in the Bank's recent history, is quite out of the ordinary.

The particular interest which our own market takes in the Bank of England's action arises from a more or less prevalent idea that the Bank had entered the field expressly to curb the American stock speculation. Now the average man will be apt to ask what business it is of the Bank of England whether Wall Street

chooses to gamble excitedly in securities or not, and what right a London institution has to force high money rates on its own market, with a view to impeding speculative operations three thousand miles away. To answer this, a brief review of very recent financial history is necessary. Throughout the past five or six months, a stock speculation of extraordinary violence has been raging on the New York and Berlin markets. Six weeks ago, the Imperial German Bank at Berlin took official cognizance of this speculative situation. During the last half of September and the first half of October, that bank raised its official discount rate from 3½ to 5 per cent., and its president plainly stated at the time his belief that absorption of capital in the Berlin stock speculation was seriously impairing bank resources, and declared his purpose of checking that speculation by making it more costly.

This effort at Berlin appears to have been reasonably successful. But the German bank's position was in some respects peculiar. Its weekly statements showed plain evidence of an extraordinary strain; at the time it made its second advance in rate, the actual status of the bank was the weakest in many years. Its so-called "emergency note circulation" had reached, that week, the largest total in its history. This was not the situation at the Bank of England. Even its statement of last Thursday, submitted when the 5 per cent. rate was fixed, showed the ratio of reserves to liabilities in the London bank to be not far from the usual average at this time of year, and its stock of gold to be as large as it has been at this date in several recent years.

It was at the opening of autumn that the rise in prices on our Stock Exchange reached its pitch of especial violence. Now, ordinarily, speculation halts on the approach of autumn. Experience has shown that when the crop-moving season comes and Western banks have abundant use for their funds at home, their New York balances will be heavily drawn upon. The prudent speculator always reckons, therefore, on a period of restraint until the harvest movement is completed. No such restraint was in any sense exhibited this autumn. The speculation, converging as it did on shares of the Steel Corporation, grew to wholly abnormal proportions; prices continued to move up by leaps and bounds. Not only did the stock market as a whole show signs of feverish activity, but the Steel shares alone, on days when total transactions in all stocks on the Exchange exceeded a million shares, made up at times no less than 40 per cent. of that enormous trading.

In accordance with experience, the interior banks began some weeks ago to call home their New York funds; as a consequence of this, and of the rapidly mounting liabilities, surplus reserves of the New York associated banks approached exhaustion. It was under such conditions, three weeks ago, that our bankers entered the London money market with exceptionally large demands for funds on the basis of Stock Exchange collateral. In a single week, when the local situation ought to have been expanding New York bank loans, the bank statement at the end of the week, showed $49,000,000 loan reduction —a contraction greater than had ever before been witnessed in this city. This meant unquestionably that an enormous sum of credits had been shifted from New York to London, as an alternative to actual liquidation of loans in speculative Wall Street.

Here was the phase of the situation, which is alleged in Europe to have had its part in inspiring the Bank of England to mark up its discount rate, and thereby raise the general London money rate for restrictive purposes. Wall Street inquires exactly why the Bank should feel compelled to meddle in a borrowing operation in which the London lender and the American borrower equally profess themselves to be content. The answer probably will be found in the experience of both markets during 1906 and 1907.

In the earlier of those two years, an equally extensive borrowing operation on the London market, to support a Wall Street speculation, had created a huge foreign credit for American account. Things did not go well in the United States. The New York money market fell into disorder, deficits in bank reserves occurred, and the holders of these London credits promptly drew on them in the form of gold, draining the London market in enormous sums and impairing seriously the Bank of England's gold reserve at the most awkward moment of the year. In 1907, a somewhat similar result ensued, emphasized by the panicky nature of the American demands.

To all such reasoning on the question, it is frequently replied, on Wall Street and in certain quarters of financial criticism, that the American speculation cannot really have cut a figure in the Bank of England's action, and that the Bank itself must be frightened about its power of maintaining a sufficient gold reserve, and is doubtful as to the future situation of the London market. But nothing could very well beg the question more completely. Even granting that such a delicate situation had arisen or was anticipated on the London market, what would be said of a central institution which did not then employ all its power to obstruct a sudden and large demand on home resources by foreign borrowers, whose demands had no other basis than an extravagant Stock Exchange speculation?

Money and Credit Instruments in Their Relation to General Prices

Second edition, completely rewritten, with statistical material brought down to the close of the fiscal year 1908.

By EDWIN WALTER KEMMERER, Ph.D., Professor of Economics and Finance in Cornell University, and sometime Financial Adviser to the Philippine Government relative to the Establishment of the Gold Standard in the Philippine Islands. $1.25 net; by mail, $1.31.

The subject of this book is the most fundamental problem in monetary science—the laws determining the movement of general prices. The book is of special interest now because of its careful treatment of the principles underlying the influence of the world's gold production upon prices.

From reviews of the first edition of the book:

"This little volume is in many ways the best thing that has appeared in monetary investigation for some years past. . . . "—*Nation.*

"Professor Kemmerer's book we believe to be one of great value. . . . "—Professor Irving Fisher, *Yale Review.*

"The study is of the kind which is a credit to American scholarship."—Professor J. Laurence Laughlin, *Journal of Political Economy.*

HENRY HOLT AND COMPANY, 34 W. 33d St. NEW YORK

The Conquest of the Air

By ALPHONSE BERGET.

Profusely illustrated from Photographs and Diagrams by the author. 8vo, $3.50 net.

A history of aviation from the earliest times to the present day, with full accounts of the recent exploits of Zeppelin, Wilbur Wright, Farman, Blériot, and Latham—to mention only a few.

The Nation.

NEW YORK, THURSDAY, NOVEMBER 4, 1909.

The Week.

The intrusion of Mr. Hearst into the New York campaign at the head of an independent ticket made up otherwise of Fusion candidates brought about a threefold contest chiefly characterized by mutual defamation. The result has been to elect Judge Gaynor, Tammany's Mayor, by a plurality of 70,000 (though a minority of 80,000), but to bring in with him all the rest of the Fusion ticket. In effect Tammany has received the most shattering blow in its history. The city now has a Board of Estimate of able and honorable men, elected over the dead bodies of the whole line of Tammany nominees. It is true, of course, that the great deliverance is largely due to a happy accident of politics. Yet it is only fair to say that this tremendous break-up of parties, this new demonstration that Tammany's mercenary hold upon its followers can be broken, this unexampled independence in city voting, were all the while in the situation as a threat to the power of Murphy, and a warning that the old order of things was passing away. That all the anti-Tammany elements could not be united in support of a Fusion candidate for Mayor was merely the misfortune of the campaign. The proof remains clear that Greater New York is ready and eager to throw off the yoke of Tammany. It can never be said again that this city wallows in misgovernment unashamed. Meanwhile there is a wonderful chance for Judge Gaynor. If he is the reformer his friends say he is, he will bend every effort to work harmoniously with his high-minded associates in the Board of Estimate.

The defeat of the disfranchising Constitutional amendment in Maryland is the most important single result recorded in the State elections of Tuesday. It ought not to be too much to hope that this second emphatic rejection of the proposition by the people of Maryland will put an end, for a long time to come, to the mischievous agitation that has been kept up by the Democratic politicians for the purpose of securing their hold on the government. The matter is of national interest, for more reasons than one. The adoption of the amendment would have brought about what, in spite of the existence of similar Constitutional provisions in States further South, would have been essentially a new thing in our political history; for the nullification of the Fifteenth Amendment, defended in those States on the plea of necessity, and backed by the almost unanimous sentiment of the white population, would in Maryland have resulted from a mere majority vote, in the face of the vigorous protest of a strong minority, which has behind it a record of beneficial political achievement. Another, and a most unfortunate, aspect of the success of the disfranchising amendment would have been the addition of Maryland to that body of Southern States which has, ever since the war, ceased to be debatable ground in national contests; whereas Maryland has been a notable factor in such campaigns as that of 1896, not to speak of earlier ones. As for the effect on home politics, a leading feature of the fight on the amendment has been the opposition of those who represent uncompromising hostility to the Gorman machine, or its successor, and the result is therefore not only a victory for honest observance of the Fifteenth Amendment, but also a defeat for ring rule.

As an indication of public feeling on national issues, however, nothing in the returns is so striking as the close shave by which the Republicans carried Massachusetts. The plurality for Governor was only 8,000, against 60,000 last year; while the Lieutenant-Governor's plurality was cut down from 96,000 to only 5,000. Nor is the difference to be explained by the fact that this is an off-year; for in the election of two years ago the Republicans carried the Governorship by 106,000, an even greater plurality than that of the Presidential year. There seems to be no possible explanation of the slump other than dissatisfaction with the course of the Republican party on the tariff. Now this showing in the Massachusetts election gives new prominence to the matter. The pity is that the Democratic party is so lamentably unprepared to profit by its opportunity. Its record in the recent extra session of Congress—especially that of the Southern members with a few honorable exceptions—is not calculated to excite enthusiasm or hope. Never has the havoc wrought in that historic party by the Bryan folly of 1896 been more forcibly brought home.

Further testimony to the fact that Mr. Taft has neither pacified nor intimidated the insurgent West is brought forward in the first of a series of articles in the Chicago *Tribune*. Throughout the entire sedition belt—Indiana, southern Illinois, Wisconsin, Minnesota, Iowa, Nebraska, Kansas, and Missouri—the *Tribune's* special investigator finds the Republican party broken up into two hostile camps on the question of Aldrichism and Cannonism. And the determination on both sides is to rule or ruin. Where the conservative element still holds its own, it has been helped largely by the prevalent prosperity. But as it is, there is quite an army of nervous Congressmen sitting on the fence, and ready to drop off into the insurgent camp when Cannon's sun begins to sink. We do not expect President Taft to offer help. The very reasons of party unity which made him stand with Aldrich on the tariff bill, now demand that he should recognize what the sentiment of the West is in the matter of Cannon.

Secretary Knox got back to Washington barely in time to receive officially the members of the Japanese Commercial Commission. As it was, the death of the secretary's wife's aunt stood in the way of his offering the Japanese visitors any closer hospitality. And as Secretary Meyer, "who was to have received the delegation," was out of town over Sunday, and as Secretary MacVeagh was at his home in New Hampshire and Secretaries Dickinson and Nagel and the Postmaster-General were with the President, it fell to the lot of the Japanese visitors to be entertained by certain assistants in the State Department. Such a wretched exhibition of official manners is sharpened by contrast with what the Japanese government, under similar circumstances, would have done. As the case stands, it will be necessary to ex-

plain to the Japanese that our manners never were very good, and that upon this second of November, the President of the United States and five out of his nine ministers of state—new men who presumably should be busy learning their business—had not yet returned to the capital from their vacations.

Judge Holt is as sound and fearless a Federal judge as we have, and his decision that two of the men indicted for criminal conspiracy, in connection with the shutting up of the Pennsylvania Sugar Refining Company by the Sugar Trust, must escape under the statute of limitations, will be accepted as a conclusion to which he was driven by the law and the facts. Whether the others will be able to get off on the plea made for Messrs. Kissel and Harned, does not yet appear. The question will turn on the doctrine of "continuing offence"—that is, of overt acts subsequent to the original conspiracy and in execution of it. The statute of limitations is not a very exalted defence for a man charged with crime, but still it is the law. It is for the good of society that criminals shall be prosecuted promptly; and if the authorities laxly permit the statute of limitations to run its term without beginning a prosecution, the blame falls upon them, not upon the law. For "crimes not capital," an indictment must be filed within three years. When, therefore, Judge Holt found from the evidence that Mr. Kissel's part in the sugar refining conspiracy was completed before January 4, 1904, there was nothing for him to do but decide that an indictment more than five years later would not hold. If the other indicted officials of the Sugar Trust also escape, people will say again that rich offenders cannot be punished under our laws. That is not true: witness the recent cases of Morse and Walsh. Moreover, in this particular instance, complaint ought to be directed not against the courts or the laws, but against the supineness of those set to enforce the laws. Who was President in 1904? Who was the Chief Executive to whom Mr. Earle of Philadelphia in 1906 addressed an urgent letter setting forth the precise evidence on which these men were indicted in 1909? If the guilty now get off scot free, it is due to the fact that the Roosevelt Administration would not proceed against these rich men.

Meanwhile Attorney-General Wickersham has announced that the government will appeal from Judge Holt's decision. His ground is that "where the law enacts that every person who engaged in a conspiracy to restrain trade is guilty of a misdemeanor, it means that so long as the conspirators are continuing in a course of conduct which restrains interstate trade or commerce, they are violating the act, and that where the restraint of trade may be terminated by their voluntary act and not otherwise the statute of limitations does not begin to run in their favor until they perform the act which terminates the restraint and allows the current of trade which they had interrupted to resume its course." The issue thus raised is evidently of far-reaching importance, and the possibility of making the appeal furnishes pointed evidence of the utility of the act of March 2, 1907, which permits appeals by the government in criminal cases against judgments rendered on a special plea in bar.

The most persistent self-advertiser in New York city, who cannot even lose a trunk without having at least a column printed about it in the newspapers, Collector Loeb is now the subject of very disagreeable publicity. One of the ablest judges in our courts has deliberately censured him for his action in retaining in the government service three men who had confessed to taking money for defrauding the government by entering false weights. The granting of immunity to criminals who turn state's evidence is familiar, but to allow self-confessed rascals to remain in office is a public scandal. That the taxpayers, thanks to Mr. Loeb's bad judgment, have got to pay the salaries of confessed thieves is a trifle too much for endurance. The explanation is that they could not get employment elsewhere—as if that mattered. They are richly enough paid for any service they have rendered by the waiving of the punishment they deserve. We cannot believe that Mr. Taft and Mr. MacVeagh will approve such a confession of the ineffectiveness of the Treasury detectives, or consent to this degrading of the government service.

Mr. John D. Rockefeller's gift of a million dollars for the purpose of investigating and combating the hookworm disease, is a piece of enlightened philanthropy. Only two or three years ago, the existence of this disease was hardly understood; the first announcement of the discovery of the parasite gave occasion for unending merriment by newspaper jesters the country over. Now, however, the extent of the evil has been discovered to be so great as to call for prompt and vigorous action. As in the case of tuberculosis and other preventable diseases, the evil done by the hookworm can be estimated in dollars and cents. Hence the value of the gift will appeal especially to business men who have heretofore looked upon the discovery of the hookworm as the latest medical fad. Following the usual form of his more recent benevolent undertakings, Mr. Rockefeller has appointed a board of twelve members, most of whom have been influential in administering his great gifts for education and medical research, many of them of the very highest professional standing. There is, therefore, every guarantee of wise and scientific administration.

The theatre is coming into its own, if the progress of civilization among the American people may be judged from the magazines—and who is there that would dare to question that fact? With the opening of the new institution on Central Park West as a text, pretty nearly every November magazine has something to say on the drama, and some magazines say it twice. But the tendency has been manifest for the last year or two. Nearly all the popular magazines have their monthly dramatic review, each after its own fashion. The sprightly publications have run to chatter and merry quip. The uplift magazines dilate on the advent of the American playwright and how much money he makes. The Excelsior-and-never-say-die magazines point out how many tens of thousands of dollars it costs to stage a play, and urge the unrecognized playwright to be patient. All the magazines run to pictures, and most of them to excess. It may be that reasons of economy are behind the sudden development of the theatrical department in the monthly publications. A handful of photographs of handsome women costs almost nothing. But whatever the fact may be it is apparent that Puritanism in the

rural districts must be rapidly declining, if the number of chorus-ladies photographed for the popular periodicals is an index.

In reading the detailed account of the proceedings in the House of Commons when the government was challenged to justify its failure to make representations to the Spanish government concerning the prospective execution of Ferrer, one cannot fail to be impressed by the contrast with what would have taken place in our own House of Representatives. There was, the report states, a condition of strained expectancy when, amid profound silence, the leader of the Labor party put his question. Sir Edward Grey, secretary of state for foreign affairs, replied in a few brief sentences which, however, fully covered the ground. "His Majesty's government," he said, "cannot depart from the rule not to interfere or to express opinions concerning matters of internal administration in other European countries when no British subjects or treaty rights are involved. . . . This rule is one observed, so far as I am aware, by all European governments in their dealings with each other, and to depart from it would serve no useful purpose." Additional questions and comments failed to draw from him another word of any kind, and the completeness with which the issue had been disposed of, in the judgment of the House, was made manifest when, on a test question, only eighteen members out of the whole House voted with the mover of the protesting motion. It is quite certain that among the members of the House there are many who could talk with great liveliness on various phases of the Ferrer case, but the habit still prevails there of regarding the proceedings as a matter of carrying on the country's government and not as an opportunity for getting one's thoughts—or words—on things in general into print.

The bye-election in Bermondsey last week can fairly be interpreted only as a severe blow to the Liberals. No one expected them to hold their tidal-wave majority of 1906, but that a seat which they then carried by above 1,700 majority should now go to the Conservatives by a plurality of more than 900 cannot be taken except as a decided reverse. It is true that the contest three years ago was straight-out, while last week it was three-cornered, and that if the Socialist-Labor vote of Dr. Salter, 1,435, were added to the Liberal vote of 3,291, it would leave the Conservatives in a minority by more than 400. But this is cold comfort for the Liberals. On a total poll increased from the 7,791 of 1906 to the 9,004 votes cast last week, the Conservatives gained 1,217 while the Liberals *lost* 1,484. And to say that the third candidate drew off enough votes to decide the election is only to say that the Liberals have not been able to arrange a working-agreement with the Socialists and the Labor party. One bye-election does not make a party defeat, but the triumph of the Conservatives in a strictly working-class constituency will make them more ready to force a general election on the issue of the budget. Unless some compromise is patched up an appeal to the country may be looked for not later than January.

The throwing of acid upon the Bermondsey ballots by the suffragettes illustrates clearly the danger of Mrs. Pankhurst's policy. True, the organization which tried to spoil the ballots was not Mrs. Pankhurst's, and the reports vary as to whether acid or coloring fluid was used; one of the inspectors was, however, injured and his eyesight imperilled. The suffragettes, who assert that they never have injured anybody by their stone-throwing, may offset this act by citing the playing of a hose upon an imprisoned suffragette for which Mr. Gladstone has apologized in the House of Commons. But the point we would make is that a policy of violent obstruction is apt to be carried too far by the ill-balanced people who attach themselves to every cause. Maria Weston Chapman once said that the good Lord used as His tools in the anti-slavery cause some persons that she would not touch with a twenty-foot pole; and some might say the same of a few of those connected with the suffragette movement. The right to lawful assembly, to voice their protests, to approach the government which taxes them without representation, ought to be granted to every Englishwoman. Even the disturbing of meetings by heckling speakers is a time-honored British custom. But an actual deed of violence may put Mrs. Pankhurst's cause back for years by depriving it of public sympathy.

In our ignorance, we do not know what a "whist-drive" is, but we note with interest that English bishops are pronouncing against it as a means of raising money for church purposes. We infer that it is a form of gambling. Its condemnation marks a certain advance since advertisements were published beseeching English society people to set aside one-quarter of their winnings at bridge for holy objects. The whist-drive, however, must be more offensive, for the Archbishop of York "rather deprecates the practice" of putting churches in funds by means of it. Other ecclesiastics are reported as "intensely disliking" it, or "declining to accept money raised by this means." The Bishop of St. Albans "could not use the proceeds of whist-drives for any kind of spiritual work." This would seem to limit the application of sums won at cards to the purely non-spiritual work of the churches.

German newspapers have been discussing an interview which the new Chancellor recently gave to a French editor. In it, Herr Bethmann-Hollweg intimated that he had taken office with an absolutely free hand, so far as political parties were concerned. He should hold fixed relations with no party group in the Reichstag, but should maintain a position of entire independence. This may be taken in two ways. It may be intended to convey the meaning that the Chancellor regards his power as derived exclusively from the Kaiser, and that he is opposed to the idea of a responsible Ministry, or anything approaching it. On the other hand, it may signify that the Chancellor wishes to notify the combination of Conservatives and Clericals and Poles which upset Prince Bülow that their rejoicings are premature, and that Bethmann-Hollweg will not be their obedient servant, but will feel at liberty to rule by means of any other groupings in the Reichstag. Party backing of some kind he must have; since no divine right can get taxes voted except by a majority. There is, of course, the possibility of dissolving the Reichstag, but there is also the certainty of great gains by the Social-Democrats, whenever a general election is held. All told, therefore, the oracle of the new Chancellor is sufficiently Delphic.

JUDICIAL PROCEDURE IN AMERICA

Among the problems that are constantly clamoring for attention, there is one which, while among the most important and the most difficult, presents a refreshing contrast to most of the others. In almost every field of remedial agitation, the dominant element is the moral crusading, the denunciation of selfishness or turpitude, the exposure of corruption or dishonesty. In one matter, however, the evil is discussed by responsible critics in an objective and impersonal way; and for this, in these days of much muckraking, good and bad, there is reason to be grateful. Such an article, for example, as that by Mr. George W. Alger on "Treadmill Justice," in the November *Atlantic*, is simply a presentation of facts and an analysis of causes, not an arraignment of individuals or a homily on national morality. It perceives that a certain state of things has grown up which is full of the gravest faults and fraught with most serious mischief; but it brands nobody as a malefactor and attacks no class or section of the community.

This by no means implies that the article is wanting in emphasis or in moving quality. On the contrary, the examples it cites of the delays and perversions of justice bred by our methods and habits of judicial procedure are calculated not only to impress but to amaze the average reader. When we read of the case of Jarndyce vs. Jarndyce, few of us imagine that anything bearing a remote resemblance to the story of "Bleak House" can even now be going on in our own country; and yet Mr. Alger gives in detail the history of a simple accident case, involving no difficult question of law, which came to an end in New York State only three years ago, after having been in the courts continually for twenty-two years; of another case—a complex case against an insurance company—which was tried no less than nine distinct times and which the plaintiff abandoned in despair, refusing at last to go to his lawyers about it or to appear when the case was being tried; and of other cases comparable to these in their intolerable protraction. Nor are these cases so exceptional as to furnish no indication of the ordinary operation of the system. The report made to the Governor of New York in 1904 by the Commission on the Law's Delay not only exhibits the extent of the evil by a great mass of particulars, but voices also a general opinion:

> The condition of our own courts recalls that of the courts of the Roman Empire before the reforms instituted by Justinian, and of which Gibbon wrote, as if describing our own situation:
>
> "The expense of the pursuit sometimes exceeded the value of the prize, and the fairest rights were abandoned by the poverty or prudence of the claimants. Such costly justice might tend to abate the spirit of litigation, but the unequal pressure seems only to increase the influence of the rich, and to aggravate the misery of the poor.
>
> "By these dilatory and expensive proceedings the wealthy pleader obtains a more certain advantage than he could hope from the accidental corruption of a judge."

It would be of little use to dwell on these evils if there were no prospect of remedy. That they will not be mended in a day is certain; but that improvement, and radical improvement, will come in a reasonably near future, there is ground for believing. In the first place, in the past few years there has been a remarkable growth of serious interest in the subject, of which the most notable manifestation, perhaps, has been the emphatic recognition of its urgency by President Taft. Secondly, it is always possible to point to the example of England, which in the course of a few decades advanced from a point of backwardness in judicial methods far behind our own to a condition in which she is a shining example of efficiency, promptness, and good sense. As Mr. Alger points out, it was possible, at the end of a half-century of Queen Victoria's reign, for Lord Chief Justice Bowen to say, what we are very far from being able to say in America to-day: "It may be asserted without fear of contradiction that it is not possible in the year 1887 for an honest litigant in Her Majesty's Supreme Court to be defeated by any mere technicality, any slip, any mistaken step, in his litigation. . . . Law has ceased to be a scientific game that may be won or lost by playing some particular move." And what England has done, America can do and must do.

But there is a third reason for hopefulness. It lies in the practical unanimity of all who have considered the subject as to the main defect to be remedied. Two things are at the root of the evil: The absence of a reasonable limitation of the right of appeal, and the minimizing of the functions of the courts of first instance which goes naturally with absence. The ramifications of this pervading defect are shown in many ways in Mr. Alger's article. Not only does it lead to intolerable delay, and not only does the usual practice of our higher courts produce unnecessary hardship in ordering a new trial even in cases where the law empowers them to end the litigation by their own decision. The omnipresence of the idea of appeal operates to lower the tone and impair the effectiveness of the judges in the lower courts all along the line. The judge who must ever tread gingerly lest he slip into saying something that may be made a ground for reversal is unable either to confront the real problem with full vigor or to address the jury in language adapted to the requirements of the case and to the limitations of their knowledge. And, as in all such matters there is a vicious circle of cause and effect: the judges of the lower courts, shorn of their rightful power and dignity, seem comparatively unimportant officers; as a consequence, men of inferior calibre are supposed good enough to fill these judgeships, and hence results a further decline in their importance. From every point of view, therefore, the centre of attack must be not only the law, but the habitual practices of appeal procedure; and in this direction of reform the efforts of the leaders of the bar, throughout the country, must grow in volume and intensity until the end is attained.

THE FOOTBALL DEATHS.

For a long time past defenders of football, as it is played to-day, have been saying frankly: "If a player on a first-class football team is killed, it will be all up with the game." Well, Cadet Byrne, the acting captain of West Point's eleven, a first-class team, is dead, and the Annapolis quarterback is lingering with a broken spine, there being a bare possibility that an operation will restore him to health. Yet we have the usual protestations that such accidents, deplorable as they may be, are inseparable from manly sports, and that the game is necessary to develop the right qualities in the future soldier or sailor. There is even a dispatch from a Chicago college president putting the blame on the short hours of practice of the West Point team, as if the cadets, with their rigid drills, were not always

in the pink of physical condition. No; the myth that football is fatal only to members of scrub teams is now exploded. Everybody familiar with the game knows that a player may be stretched out in the Harvard-Yale game precisely as was the poor fellow at West Point on Saturday.

Surely, the moving spectacle of that dying boy ought to be enough to bring about a final reform of the game or, if the present rules are clung to, its abolition. For it is the mass play which is responsible. Throughout this season, the whole trend of the play has been towards the old massing of men against one spot in the opponents' line. From Harvard particularly have come telegraphic reports of a resort to the "old-fashioned game." At West Point before the tragedy Harvard's team displayed little else besides brute ability to plough through the cadets' defence. Its chief reliance is a 200-pound plunging halfback who is repeatedly hurled into the line. According to a trustworthy report, the forward pass, from which so much was expected two years ago, came into play only three times, and with indifferent success. In other words, the game is drifting back to the old conditions, when it was wholly a question of shoving the ball forward by mass-play, when the light, agile man was excluded, and skill and speed discounted. The make-up of the teams this year is in itself a confirmation of this reaction, for most of the players are of the "beefy" type.

All this can be stopped if those in control of the game wish to end it. When the Rules Committee last "opened up" the game, they made ten yards the distance to be gained by a team with the ball, in default of which the ball must be surrendered. Now, if ten yards are not enough to stop mass-play, let them make it twenty yards, so as to make necessary kicking, forward passing, and long end-runs. The difficulty is that the Rules Committee is in the hands, not of critics of the game, but of men who desire to make just as few changes as possible and are quite averse to reconstituting it in such a way that it will resemble the English or "soccer" game, in which players are not allowed to run carrying the ball. The chief argument we have heard against this change is that the English game is not an exciting enough contest for the young American, precisely as cricket can make no headway against baseball, because it lacks sensational possibilities.

We are not denying that the football of 1909 is a great deal better than that of 1905—so high an authority as Walter Camp brings that out in his article on College Football in the current *Century*—any more than we overlook the fact that there are fatalities in baseball as well as in football. But the killing of a man in mass-play is a different thing from an occasional death from a pitched or batted ball. Mass-play means injuries in every practice and every game; any one who has followed the daily dispatches from the football field must admit this. Harvard, for instance, was without three of her first-string players on Saturday, all veterans of last year's successful team. A baseball team deprived of three of its players is a rarity, indeed. What is needed is the elimination of all unnecessary risk, if the game is to persist; and when the danger disappears it will be an infinitely better and more interesting sport. One thing is certain, the deaths in this season's football are not due to any features of the open game.

In the hands of the supine college presidents lies the power to insist on the needed changes. Let them but notify the Rules Committee that Columbia's example will be followed if the game is not reformed once for all, and that committee will become overnight the busiest set of inventors in the United States. Then, with the game ordinarily safe, the question of the desirability of continuing intercollegiate contests on their present scale can be discussed with greater calmness than is now possible. Meanwhile, we trust right-thinking men and women the country over will bring all pressure possible to bear upon college authorities for a radical change. Football is not merely a sport now; it is a contrivance for injuring and maiming—for more men go through life with "game" knees, battered shoulders, and broken tendons than the public has any idea of. And no one, we trust, will be misled by to-day's West Point manifesto that football "fosters the manly virtues that are especially necessary in war." The chief thing aimed at in war is to kill, and kill quickly, and—shades of Gettysburg!—there were manly West Point cadets and the bravest and most virtuous of American soldiers long before football was ever heard of. We have, indeed, such faith in Col. Scott and his West Point corps of teachers as to assert that, without football, the cadets they would turn out would be neither vicious, nor effeminate, nor cowardly.

CLAUDE LORRAIN: TEACHER.

A book that has had its day in Germany describes Rembrandt as teacher ("Rembrandt als Erzieher"), but we think an honest survey of the group of his paintings now at the Metropolitan Museum would only warn off the wise artist in whatever medium. Rembrandt seems so solitary, inapproachable, inimitable. In his wake lies nothing but shipwreck for us. Possibly our painters and men of letters would do better to take counsel of that more accessible genius, Claude Lorrain, a small but precious collection of whose sketches is now being shown at one of the prominent print-sellers.

It is hard to imagine anything more edifying than these little notes in ink and sepia. On a palm's breadth of paper you see a river valley winding its way in to the roots of distant mountains. Or again you catch the sense of wind and rain and broken light over square miles of rolling champaign. Or, perhaps, a few spare objects—a tree, a castle, a mountain ridge—are set down so justly that one feels the vast stretches of intervening air. These, despite his detractors, are the well recognized merits of Claude in his slightest as in his monumental work.

But the defects of these drawings seem even more instructive. Yes, Ruskin, brutally in error on the main issue, was right in minuter specifications of dissent. How perfunctory are the tree forms and foreground indications generally; any one of a score of League students could give these objects more character. The handling of the wash is slow, timid, and almost casual; fifty contemporary illustrators could do the thing more crisply. In short, the magic of the hand is almost absent from these sketches. They are in a manner ill-done—and supremely, inapproachably lovely. The fact may well give pause to a generation of artificers that has sought salvation mainly in the cunning of the hand.

The superlative detail has long been

assiduously preached. It has almost been assumed that the law and gospel of the literary art were summed up in the commandment: Make unique and lovely phrases; of painting in the formula: Let your touch be exquisite. Perhaps this particularism is based on a rather stupid adherence to the talk—not the practice, mind you—of Flaubert in letters and of Manet in painting. There seem to be souls simple enough to imagine that "Madame Bovary" is a great book because of its incidental rhetoric. As a matter of fact, only its relentless movement and massiveness have kept it alive. The intolerable labor of the file with which Flaubert tortured himself is largely labor lost. Manet is, indeed, exquisite in every detail, but the merit lies always in the balanced impact of the whole composition. In other words, it is the intellectualized vision of the man, and that only, which gives worthy employment to the sensitive hand.

Now, the dilemma of every artistic life is to strike the just balance between reflection and execution. Obviously, execution cannot safely be neglected. Even Claude attained to a placid adequacy in this regard. And because he refused to do more, his case is peculiarly instructive. It is as if he felt so keenly the importance of the original constructive vision that he declined to blunt or complicate it through executive processes too painful or too prolonged. Ingres once said rather stupidly that to draw a picture was everything, and that the painting went of itself. Claude may be imagined as saying that to see pictures was everything—to see them with utmost clarity and fervor—and that the rest was largely a tedious superfluity. The doctrine is perilous, but, as a personal maxim at least, Claude's practice fully justifies it.

Yes, the constructive side of art is the important one, and, to-day, whether in criticism or in formal instruction, the most neglected. Let no one who has thought and felt a work clearly despair lest adequate means of expression be denied him. Let him merely beware of mistaking diffused ambition for clarified vision. History gives us no record of a truly creative soul denied adequate means of expression. We may amuse ourselves by wishing for a more athletic Claude or a Watts obedient to the teachings of Couture, but it is folly. What painter who talks glibly to this end would venture practically to alter or efface a single stroke of a Claude seaport or a Watts portrait? No, we must take our geniuses as they come. The danger is quite the other way—that hundreds of aspirants with really nothing to say may attain a specious technical facility, and thus impose their emptiness upon us.

And right here we advise every young person who is painting or writing to go and see the Claude drawings. You, sir, accomplished spinner of phrases; you, sir, skilful combiner of planes and values, may test yourself against these little sheets of yellowed paper. If you loftily scorn these modest works for the phrases you fancy you could amend, there is no hope for you. Go on being just one more clever futile person, and pray merely that the abyss of your own emptiness may never be fully revealed to you. If, on the contrary, you can feel the large harmony of design, the fervid sanity of conception, in these little drawings, the visit may mark for you the beginning of artistic righteousness.

Two new buildings, one in Boston, one here, are each the product of most intelligent and tasteful architects. These buildings are scholarly and refined in detail, even exquisite in the proportions of the order, adjustment of decoration, etc., but each looks as if it could be covered by an inverted soap box. In other words, they have been conceived in paper, not in stone, in the parts and not in the whole. To regain the lost position of monumental design is the problem of modern art in whatever branch. Claude may well be a leader to take us from the levels of cheese-paring ideas to the upland of genial creation. From him, and partly, as we have seen, in virtue of his defects, we may learn that it is composition and mass that really count in picture, novel, or pediment. Withal—again by reason of his defects—Claude is a most available guide. What heights he reached, although troubled by a certain weakness of heart! Some such vantage point surely must be accessible to those of us who boast of our temperament, if only we can subordinate it to a fine and purposeful intelligence. We need, in short, to look inward towards the springs of vision, and concern ourselves less with doing. Long before Claude, the ordeal of the artist was suggested in the words, "As a man thinkth in his heart, so is he." When an artist thinketh nothing in his heart, the art, whatever its specious appearance or repute, will be—according.

THE CHILD'S LIBRARY.

As the season for publishing children's Christmas books sets in, we note again a pamphlet, artistically printed and designed, entitled "The Child's Own Library: A Guide to Parents." Ambiguous though the sub-title may seem, the purpose of this publication by the Brooklyn Library is heartily to be approved. "This list has been compiled," we read, "in answer to a demand frequently made upon this library by parents and friends of boys and girls who desire to present their young people with the best of books, yet who realize the snares laid for purchasers in the enormous yearly output of mediocre 'juveniles' and in the glittering bargain-book counters of the department store." Included in the catalogue of "The Child's Own Library" one finds, not books of science and art and history, but the "books of power"—to apply De Quincey's phrase to these children's classics. There are sixty titles in all, among them the Kate Greenaway books; Hans Christian Andersen, Hawthorne's "Wonder Book" and "Tanglewood Tales"; Kingsley and Bunyan and "The Arabian Nights." It would be pleasant for grown-ups to linger over some of the books, in the spirit of Hazlitt re-reading old favorites in maturity. But the real subject is the Child's Own Library, and how it is made up.

The old recipe was simple enough. It was, as those of us remember who read, as children, books especially prepared for us, a matter of writing down to the proper level. Instead of taking his readers up into a hill country, with widening horizons, the manufacturer of juveniles felt it his obligation to sink himself to the supposed ineptitude of the untrained mind. Hawthorne was among the first to permit his theme to soar, "whenever such was its tendency." He wrote in a preface of 1851 that "children possess an unestimated sensibility to whatever is deep or high, in imagination or feeling, so long as it is simple." They are bewildered only by the artificial, the complex. With what dismay must Hawthorne's calm assertions have struck the juvenile-purvey-

ors, the international brotherhood of Berquins! And yet perhaps they fancied him no real adversary; only a misguided enthusiast, who had stepped out of the House of the Seven Gables by mistake. If so, time has proved them wrong.

Hawthorne's principle was to rise with his subject. Probably Anatole France knows Hawthorne only by reputation, and for his greater tales: it is not to be supposed that he ever read the sentences we have quoted from one of Hawthorne's prefaces. And yet they agree so perfectly in this matter, the New Englander of yesterday and to-day's French cosmopolitan, that the slave to the parallel-column method of criticism would be tempted to allege a borrowing. It is the simple truth that men's feelings have changed on this subject of juveniles: a new kind of books *pour la jeunesse* is now demanded, in France as here at home. When the maker of "Le Livre de mon ami" wrote that children resent a writer's attempt to enter their own peculiar kingdom, but call for admittance to the wider world of the adult, he was expressing his own thought. And this little piece of child-psychology explains why books like Mr. Kenneth Grahame's, however exquisite, rarely appeal to children. Something of artifice repels them, though their elders accept it freely. Old-fashioned books of generous sentiment—"Lord Fauntleroy" and other Victorian child-romances—they do not refuse. The ultimate requirement is the child in a grown-up world, not the adult in the children's palace of youth. In nature-books and the like, the case is only slightly altered. If grown-ups count for little in Mr. Kipling's "Jungle Books," one has a world of other non-childish characters: Rikki-Tikki-Tavi and the forest brotherhood.

The writer of books for children must not condescend. His task is not to be thought of as a bit of relaxation. To have something to say, to say it without artifice, without complexity, is his problem. Nor is it a case of inventing a "special style." Anatole France, who writes so delightfully of his own childhood, has set down all the really expressible specifications. "Think well," he counsels; "write well; give life to everything you write, and let it be powerful, broad, big." Most of the books published this autumn will doubtless fall to stand these tests; but what of that? Also, the fact remains that the best books for children are the books written for men and women; not, of course, *all* the books written for them, but those neither over-written nor over-subtilized. Boys there are who have enjoyed their elders' "Don Quixote" and Cooper. Boys have got as much pleasure as any one out of "Robinson Crusoe"; yet that was a book composed for gravest merchants, and bearded sailormen detained in port. The nucleus of the Child's Own Library is a precious heritage that was his father's before him. The books most unquestionably good for children are good for all the world.

NOTES FROM SWITZERLAND.

NEUCHÂTEL, October 21.

The new University of Neuchâtel was inaugurated with some ceremony on October 19, when Prof. Arthur Piaget was installed as rector. By the authority of the Neuchâtel government, and with an increased endowment, the old "Academy" now assumes a more ambitious name. A faculty of medicine is still wanting; but as there are several hospitals in or near the town, it seems probable that this department of the university will soon be equipped. This makes a fifth Swiss institution of the kind: the others are at Bâle, Geneva, Lausanne, Berne, Zürich, and Fribourg.

Neuchâtel has for many years been a favorite centre of education. It has, in addition to its Collège Latin, a large school of commerce which attracts many students from England and Germany, as well as from Russia, and even from Cuba. Americans are conspicuous by their absence. The town literally bristles with *pensionnats* for boys and girls. There is an excellent and well-managed public library. The French spoken by the educated class is not inferior to that of Geneva.

At the opening of the new university, there were no representatives of foreign institutions. The proceedings began with the delivery of an elaborate address from the rector and senate of the University of Geneva. After congratulatory speeches by a councillor of state and by Meckenstock, the vice-rector, Dr. Piaget made an inaugural address on "The Library of the Counts of Neuchâtel." It was rather too academic for such an occasion; but the new rector is also a professor of history, and it was perhaps fitting that he should discuss the literary traditions of Neuchâtel from the days of Philippe le Bon and the Burgundian dominion. Unfortunately, he spoke not of the books themselves, but only of an inventory found in the château here. This inventory mentions a number of early editions, such as the works of Aristotle, of St. Augustine, and the Decameron, all of the fourteenth century. There are now in the library remnants of the ancient collection—fragments of Bibles, missals, and romances of the Round Table, beside a number of curious old bindings.

After this antiquarian discourse, the festivities usual on such occasions took place. There was a "banquet" on the beautiful terrace which overlooks the town and the lake. There were congratulatory speeches and, of course, many reminiscences. In the evening a grand *Commers* was held. To this came in procession a long procession of students of Neuchâtel, past and present. The two chief corps of the Swiss universities, the Zofingiens and the Bellelettriens, made a brave display. Some of them were on horseback; and all wore their colored caps and other insignia. There was much military music, and a profusion of banners. The procession, in spite of the torches and enthusiasm, was not so interesting as are functions of this kind in Germany. But the Swiss have a great liking for pageants. Among the floats were three representing the discovery of the North Pole. One of these was an elaborate globe with Peary perched on top holding the Stars and Stripes, the singular blue and red of which were a marvel to one's patriotic soul.

Even if Switzerland has already too many universities, it must be acknowledged that, for those who wish to work, Neuchâtel is an ideal academic town. Its quiet streets remind one of Philadelphia in its less degenerate days. It is singularly free from drinking-places and low resorts. Its theatre, although built apparently to cremate the audience in case of fire, gives performances well-adapted to the morals of the British and German maidens who come to study French amid strait-laced and economical surroundings. All who know Northern Switzerland can recall the fine environments of the town. The graceful Gothic spires of the Collegiate Church, and the ancient tower of the château rise above the blue lake across which appear the white summits of the Bernese Oberland. In the direction of Geneva can be seen the jagged ridge of the Dents du Midi; and still farther to the south, Mont Blanc shows itself like a white cloud above the intervening hills.

The old Neuchâtel Academy, which forms the nucleus of the new foundation, has a peculiar relationship to two sister universities in America—Harvard and Princeton. To the former it gave Agassiz; to the latter, Guyot. Collections and books, maps, and busts show that these men of science are not forgotten here.

By the death at Geneva of the palæontologist, Perceval de Loriol le Fort, the public and university library there

has acquired a collection of rare and valuable books and plates relating to the Protestant Reformation, including many fugitive publications and controversial pamphlets chiefly of the sixteenth and seventeenth centuries. The bequest comes rather strangely from one whose main work had been in natural science. The remainder of his library and some palæontological collections of considerable importance were left to the Geneva Museum.

The cathedral at Lausanne, destroyed by fire in the twelfth century, but rebuilt in the thirteenth, has been undergoing a thorough restoration according to plans of Viollet-le-Duc. After passing into the hands of the Protestants, the church by the dismantling of the sanctuary lost much of its original beauty. But aside from the fine Gothic interior there are two things which have given the cathedral wide celebrity: the finely carved wooden stalls in the choir, and the splendid rose window. The latter, however, fell into a deplorable state, owing chiefly to the negligence of the Lausanne authorities. About twenty-five years ago a committee on restoration decided to reconstruct the window. All the glass was removed, carefully arranged, and then replaced by Eduard Hosch, a Bernese artist. But to make the work successful, it was found necessary to effect a radical reconstruction of the entire façade of the church. The work has lately been completed. The result is that the splendor of the old window reappears; and its colors of extraordinary brilliancy illuminate every part of the cathedral. The design is an *Imago Mundi*. The sun and moon, the four seasons, the twelve months, the signs of the zodiac, the rivers of paradise, and the winds are represented by allegorical figures; while a religious touch is added by an image of Jesus appearing to John the Baptist. The window always provoked the admiration of connoisseurs, and is now a fitting decoration of the severe interior, making the Lausanne church one of the finest in Switzerland.

A Swiss Saul has appeared among the minor prophets of Christian Science. Professor Dubois of Berne, whose work, "Les Psychonévroses," has just reached a second edition, speaks a good word for Mrs. Eddy's methods. Although an agnostic, Dubois regards the Christian Science method as a species of his own which he calls "moral treatment." He employs it chiefly in functional diseases, and claims for it remarkable results. The dispute between Dubois and the hypnotic school of Nancy has already been noticed in the *Nation*, and is as keen as ever. But the latest attack on Dubois and defence of the hypnotic against the moral treatment of disease is a monograph, "La Suggestion hypnotique et la psychothérapie actuelle," by Dr. Bonjour of Lausanne, who not only assails Dubois's methods, but casts doubt upon his results. Dubois is a seceder from the hypnotizing school of Nancy, having been a disciple of Bernheim, and now argues that hypnotic treatment is dangerous and even immoral. Bonjour, who writes logically and vigorously, maintains that Dubois's "moral treatment" differs only in degree from hypnotic suggestion, and seeks to prove by statistics that the latter is far more effective.

Those who like to sup on horrors should read a realistic novel lately published at Lausanne (Payot et Cie.). It is entitled "Jean-Luc persécuté" and is by C. F. Ramuz. The scene is laid high up in the Valaisian Alps, and the book abounds in graphic descriptions of life in that region. As for the story, it is the narrative of an unhappy peasant *ménage*, told in quaint and very simple language. The wife is unfaithful, the husband becomes insane, and the dénouement of the tragedy is fire, murder, and suicide. It is by no means a "penny thriller." The author knows Valais and its peasantry well. Almost at the same time with the publication of this novel, appeared a beautifully printed and illustrated account by the same author of life in that picturesque district, which tourists as a rule know only as they pass along its *grandes routes* during the summer months. A. A.

NEWS FOR BIBLIOPHILES.

More than once reference has been made in this column to important manuscript acquisitions of Stephen H. Wakeman. Now we have to chronicle the sale of these manuscripts through George S. Hellman to J. Pierpont Morgan.

Mr. Wakeman began purchasing the books and manuscripts of the great American authors less than ten years ago, and in this short period he has brought together the most notable collection within its limits that has ever been formed. Mr. Morgan already possessed a number of manuscripts of American authors, notable among them being Holmes's "Autocrat at the Breakfast Table," Lowell's "A Year's Life," and Emerson's "Representative Men"; and this new addition makes his collection unapproachable. The Hawthorne manuscripts are by far the largest body of these in existence, the entire manuscript of "The Blithedale Romance" being the most important single item. This passed in 1897 from the possession of the Ticknor family, the publishers, and was bought by the late Bishop John F. Hurst, who, however, never had it in his possession. All the time of his ownership it rested in the safe of the New York booksellers from whom he secured it, and who later purchased it from him at a large advance, reselling it to Mr. Wakeman. The manuscript of "The Scarlet Letter" was destroyed, excepting only the title-page and table of contents, a single leaf, which was preserved by Mr. Bigelow of the University Press, where the book was put into type. From his family it passed into the Hawthorne collection of George M. Williamson, whose manuscripts were sold at auction in 1904. Two other Hawthorne manuscripts were acquired at the same sale, "Feathertop" (20 pages), and "The Ancestral Footstep" (88 pages). But the bulk of the Hawthorne collection came directly from the family through the intermediary of one or more booksellers. This comprises the original journals or diaries from which selections were made by Mrs. Hawthorne for the "American Note Books," the "English Note Books," and the "French and Italian Note Books." These thirteen volumes include much unpublished material. Some day, no doubt, they will be printed entire, as written. A commonplace book and three private diaries from which some selections were made for the "Hawthorne and His Wife" are also included, as also the manuscripts of Hawthorne's later novels: "Septimius Felton" (three different drafts of 88, 90, and 57 pages, besides two series of notes for the story); "Doctor Grimshawe's Secret" (two different drafts, one of 78 and one of 47 pages), and portions of "The Dolliver Romance."

The Thoreau collection is next in importance to the Hawthorne. Thoreau's manuscripts were bequeathed by his sister, Sophia, who died in 1876, to H. G. O. Blake. On his death they passed into the possession of E. H. Russell of Worcester. The diaries or journals consist of thirty-nine volumes enclosed in a wooden case made for them by Thoreau himself. Besides these journals, Mr. Wakeman secured many other Thoreau manuscripts, among them eleven volumes (between two and three thousand pages) of extracts from various authors on the life and customs of the American Indians, copied out by Thoreau, with comments.

Among the Poe manuscripts is a large fragment of "Tamerlane," differing very materially from the poem as first printed in 1827, and undoubtedly an earlier draft. This manuscript was formerly in the collection of Bishop Hurst. One of the few existing specimens of Poe's tales in manuscript, "The System of Dr. Tarr and Professor Fether," was formerly in the Williamson collection. The most important of all, the manuscript of his play, "Politian," in large part unpublished, was described in the *Nation* of September 5, 1907. It was formerly in the possession of John H. Ingram, the English editor of Poe's works, although it passed from his hands many years ago. Mr. Morgan already possessed autograph manuscripts of "The Bells," "Annabel Lee," and a portion (all extant) of "The Raven."

The Whittier manuscripts also comprise the largest body of his writing extant. For the most part they come from Whittier's literary executor and biographer, Samuel T. Pickard. They comprise about fifty poems, many early drafts, besides letters and prose pieces.

The other great authors are represented, but necessarily to less extent. The Longfellow manuscripts are still in the possession of the family and are likely to go ultimately to Harvard University, which already possesses the bulk of Lowell's manuscripts. Mr. Wakeman, however, was able to secure several manuscript poems in Longfellow's autograph, and two poems by Lowell.

Emerson's manuscripts are for the most part preserved in Concord, and there is an agreement among his children that none of his books or manuscripts shall be sold without the consent of all of them, this agreement to be continued to future generations. As already stated, Mr. Morgan owned the manuscript of "Representative Men"; he has now added from Mr. Wakeman's collection the manuscripts of several important essays, including "Eloquence," "Considerations by the Way," and "Progress and Culture," as well as one poem, "The Titmouse."

Holmes destroyed most of his manuscripts, and Bryant's work was in large part journalistic, but the Wakeman collection includes fine specimens in both verse and prose of these two authors.

On the afternoon of November 8 the Anderson Auction Company will sell a collection of Americana, including Champlain's "Voyages" (1640), lacking the map; Trumbull's "History of Connecticut" (1818), Hazard's "Historical Collections" (1792), uncut; Colden's "Five Indian Nations of Canada" (1750); Proud's "History of Pennsylvania" (1797), uncut; and various items on the discovery and settlement of the West, captivities, local history, etc.

On November 9, afternoon and evening, they will sell the most extensive series of imprints from Horace Walpole's private press at Strawberry Hill, and Walpoliana generally, ever offered at a sale in this country. The collection was formed by Lewis Buddy, 3d, while he was the proprietor of the Kirgate Press, one of the most praiseworthy of the numerous private presses which were in operation all over the country eight or ten years ago. The press at Strawberry Hill, established in a cottage near his home and carried on under the direction first of William Robinson and later of Thomas Kirgate, as practical printer, was one of Walpole's chief amusements during the latter years of his life. Besides the seventy-seven lots belonging to Mr. Buddy, described under Walpole, the catalogue includes long series of first editions of Oscar Wilde and Richard Le Gallienne, publications of the Caxton Club of Chicago, several Aldines and Elzevirs, and other interesting titles.

On November 10 they sell a small collection, including some much-sought titles, among which "The Vicar of Wakefield" (Salisbury, 1766); "Paradise Lost" (1668), with the fourth title page; "Paradise Regained" (1671); Gray's "Odes" (1751); and Spenser's "Fowre Hymns" (1596), "The Faerie Queene" (1596), and "The Shepheard's Calendar" (1597); Shelton's translation of "Don Quixote" (1620); and Montaigne's "Essaies" (1588), are the most notable.

On November 9, 10, and 11, the Merwin-Clayton Sales Company sells a miscellaneous collection, including first editions, publications of the Grolier Club, literary sets, etc.

On November 25, Sotheby, Wilkinson & Hodge in London dispose of the library of the late John Mitchell Marshall, which comprises an extensive collection of books illustrated by Thomas and John Bewick, together with original water color and pencil drawings, and several autograph letters of Thomas Bewick. Among other books in the sale we note the first edition of White's "Natural History of Selborne," Lilford's "Coloured Figures of the Birds of the British Islands," seven volumes (1885-97), and a few first editions of Dickens.

On November 29 and 30 they sell a collection containing many French books of the sixteenth and seventeenth centuries, mostly in fine bindings, old herbals in English and French, rare works on music, English dramatists and poets, fine art works, etc

Correspondence.

MR. CRANE'S INDISCRETION.

To the Editor of The Nation:

Sir: In an editorial in your issue of October 21, entitled "Red-Hot Diplomacy," it is possible that you have done an injustice to Mr. C. R. Crane. Your central point is that he was guilty of an indiscretion, in that "he talked too freely with a newspaper reporter about State Department secrets in connection with our relations with Japan and China." This is a serious charge by a journal of the standing of the *Nation*. Possibly you may have evidence on this point not known to others; but, after looking into the case myself carefully, it does not seem that the evidence will support the claim of an indiscretion. You say "Mr. Crane's indiscretion is not denied by him." I think what you call the indiscretion of talking too freely about State Department secrets is flatly denied by Mr. Crane. He admits that he was asked certain questions by a newspaper reporter, and that he gave certain answers, but he expressly states that "the publication referred to did not mention my name, nor in my judgment would it have been a mistake if the Department of State had not chosen to vouch for its accuracy and give to it an official significance by its own conduct. It certainly contained nothing of substance that was not matter of common knowledge or deducible by any competent newspaper reporter from facts commonly known." If it should appear that any well-informed Washington correspondent could have written the now-offending article without having a word from Mr. Crane, it would be clear that Mr. Crane exercised due diplomatic reserve in this case, as he admittedly had in hundreds of other interviews. It is obvious that the newspaper world, from the time of Mr. Knox's sensational telegram recalling Mr. Crane from San Francisco to a certain later date never thought of connecting his recall with the article which was regarded as common property by writers of the press. Moreover, there is no evidence that Mr. Taft even regarded the article itself—no matter from whom it came—as important. If you will canvass the best of the Washington correspondents it will be found that they believed any one of them could have written the article, so far as its contents was concerned. Moreover, Mr. Crane had only a very brief interview with the writer of the article, just as he was leaving Washington, September 24. I believe an impartial examination of the evidence will show that Mr. Crane was not guilty even of a technical indiscretion.

Those who have known Mr. Crane for many years have always been impressed by his reserve and discretion, in business matters, in the delicate affairs of municipal politics (in which he was an efficient leader), and in his personal relations with distinguished men and diplomats of other countries with whom he had intimate connections. The report of an indiscretion of this sort belies the whole past reputation of the man, and is incredible to the best men in this community. It is stating a commonplace to say that the management of our foreign affairs has been badly "queered" in this whole region; and that the barbarous treatment of Mr. Crane is regarded as an affront to the city and to its business men, and that its effect must inevitably be to discourage those who are not professional politicians from accepting public service.

Then why should the rattled State Department have made such an extraordinary noise about the affair? It is not just, doubtless, to assign motives in such a case. But suppose that the Secretary were wilful, and touchy at not having been sufficiently consulted in this appointment, and possibly touchy at the intimate personal relations which seem to have been established between Mr. Crane and President Taft; suppose that Japanese interests realized that a man as strong as Mr. Crane at Peking would be difficult to handle; suppose these interests were fully aware of Mr. Crane's intimate knowledge of Japanese affairs during the war with Russia; suppose they grasped the importance to Japanese credit and bonds of the necessity of getting an increasingly stronger hold on Manchuria as a means of enlarging their industries and their sources of taxation; suppose these interests were influential in our financial markets; suppose that Japanese diplomacy and these financial forces wished to defeat the probable pro-American and pro-Chinese influence of Mr. Crane at Peking; suppose they raised the cry of "jingo" war-talk—then, under all these suppositions, might we not explain the curious action of the State Department? We may not insist that these suppositions have any basis; but they would explain every step in the unfortunate affair. They would explain why, at a late day, the interview was made an excuse for a calculated scheme to unhorse Mr. Crane. As the matter comes to be better understood, may it not be followed by a general exasperation at the extent to which a foreign country can carry its intrigues even to the pass of trying to humiliate a distinguished citizen of our own land? In this part of the world it is already clear that the Administration, and not Mr. Crane, has suffered. A few more Winona speeches, a few more defences of the Aldrich-Cannon combination, a few more such bulls by the State Department, and the next House of Representatives ought to pass into the control of the Opposition.

J. Laurence Laughlin.

Chicago, October 23.

[Mr. Crane's exact language was: "A brief conversation of mine with a newspaper representative contributed to the publication by him of a discussion of this agreement"—*i. e.*, between China and Japan; also: "As I was hurriedly leaving Washington a representative of an important paper asked me about the China-Japan agreement and I said the matter was under consideration . . . and I may have said that obviously no

statement would be prepared in the absence of Mr. Hoyt."—Ed. Nation.]

CONCERNING GREEN EYES AND GLASS SLIPPERS.

To the Editor of The Nation:

Sir: Is it possible to find any connection between green eyes and glass slippers? A little gossip may perhaps throw some light on this problem.

If to-day a British or American lover in praising the beauty of his beloved one declared that she had green eyes it would not seem to most of us an attractive portrait, and the lady, even if favorably disposed to him, might possibly think that he had sacrificed politeness on the altar of truth. There are some exceptions as we shall see, but since Shakespeare spoke of "green-eyed jealousy" emerald-tinted organs of vision have become almost impossible for attractive English-speaking damsels. Yet Dante's Beatrice had eyes which are likened to emerald. And in the modern languages of the Latin races green eyes are not held to be incongruous with either masculine or feminine beauty. Alain Morsang describing a Breton peasant girl, who is the heroine of his story, speaks of her green eyes smiling on her lover ("La Petite Yvonne dont les yeux verts lui souriaient"). There is a song by René Niverd which has been translated by R. H. Elkin. The French poet says:

> Tes yeux malicieux
> Ont la couleur de l'émeraude.

The English translator instinctively feels that this "will never do," and therefore renders it:

> The glint of your clear eyes
> Is as the light the emerald flashes.

This may be true to the spirit, but it is not faithful to the letter, for the French poet speaks not of the emerald's flash, but of the emerald's color. In Arsène Houssaye's story "Les Filles d'Eve" one of the three sisters whose history is recorded has "les yeux verts." This fact indeed plays an important part in the narrative of the tragic death of M. de Parfondval. Musidora, the heroine of Théophile Gautier's "Fortunio," has green eyes, and the fact is frequently mentioned. Alfred de Musset, in his "Namouna," has the phrase:

Sur les bras du jeune homme et sur ses pieds d'ivoire.
La nalade aux yeux verts pleurait en le quittant.

Mme. du Deffand describes Voltaire as having "petits yeux vert de mer." To La Fontaine Minerva is "la déesse aux yeux verts." Clement Marot describes Venus as having green eyes, and Ronsard speaks of the water-nymphs in the same way,

Vairs ot les oils e mult fier le visage ("Roman de Troie," 5157.)

Les yex ot plus vairs c'uns faucons ("Roman de la Rose," 533.)

There has been discussion as to the precise meaning of the phrase. No doubt it was sometimes held to refer to the piercing or shining quality of the glance, but in other cases it is quite clearly a color adjective. The passage from the "Roman de la Rose" is rendered by the old English translation:

> Hir yen grey as is a faucon.

Froissart describes that mediæval ruffian Gaston Phœbus, Comte de Foix—one of whose murders was that of his own son—as the handsomest man he had seen; and he had green eyes from which there came from time to time loving glances! This beautiful gentleman varied his atrocities by hunting, of which he was so enthusiastic a devotee that it drew him into literature. He was also most punctilious in his religious observances. In Old-French the phrase "yeux verts" is one of the commonest in describing the eyes of a beautiful woman; indeed so common that it became a mere convention.

Green eyes are found in Iberian lands. Thus José Rivera Indarte, a South American poet, puts into the mouths of the courtiers of Belshazzar these words:

> Los verdes ojos del rey
> Parecen dos esmeraldas,
> La purpura de la rosa
> Sus rojos labios no iguala.

And in old Spain there is in the description given by Cervantes of the gypsy girl Preciosa, a phrase which may have suggested to Victor Hugo the name of Esmeralda for his Romany maiden in "Notre Dame." For Doña Clara says: "Este sí que se puede decir cabello de oro: estos sí que son ojos de esmeraldas."

Longfellow has taken the same name of Preciosa for his gypsy girl in the "Spanish Student." Victorian describes her as

A pretty girl; and in her tender eyes
Just that soft shade of green we sometimes see
In evening skies.

Green was thought to be a hygienic color, and for this reason, as we are told by Isidore of Seville, the ancient libraries were paved with marble of that color. Dr. W. H. Engelmann states that the Portuguese and the Spaniards have a special word for a woman with green eyes. It is *zarca* and is borrowed from the Arabic. This precise meaning, however, does not appear in the ordinary dictionaries.

Nor are green eyes altogether unknown to English poets.

Don Adriano de Armado tells us that "Green indeed is the color of lovers" ("Love's Labour's Lost," Act 1, Sc. 2). This is not Shakespeare's only reference, for the Nurse, in "Romeo and Juliet," declares

> An eagle, madam,
> Hath not so green, so quick, so fair an eye
> As Paris hath.

Swinburne also, in his "Felise," says

> O lips that mine have grown into,
> Like April's kissing May.
> O fervid eyelids, letting through
> Those eyes the greenest of things blue,
> The bluest of things grey.

Such references are not so common in English as in French literature.

But the Old-French *vair* had another meaning in addition to that which has been described. It was the name of a particular kind of fur—that of a species of squirrel called *vair*. This fur, which was dove-colored above and white underneath, is now known as *petit gris*, as we learn from Littré. The peasants are represented by de Joinville as saying: "Ils sont fourrés de vairs et de gris, et nous sommes vestus de povres draps." Thus we have:

> *vair*, a kind of fur, and
> *vair*, green, or piercing
> *verre*, glass.

And to this identity or approximation of sound the English Cinderella and the German Aschenbrödel owe the famous glass slippers.

Cinderella's fragile foot-wear must have been a difficulty to many children. But if glass slippers are not comfortable for a ball-room, fur or furred slippers do not seem very appropriate for dancing. Cinderella's story had no doubt been long current orally before it was written down by Perrault. Is it just possible that the real word should be *vert*? If green is a beautiful color for a lady's eye it cannot be an ugly one for her dancing shoes.

And thus we see that there is a possible connection between green eyes and glass slippers.

William E. A. Axon.

Southport, England, October 12.

DEMOCRACY AND LEARNING.

To the Editor of The Nation:

Sir: Professor Webster's communication in the *Nation* of October 21 on "Science and Inaugurations" raises once again the interesting question whether our college and university life is necessarily less free than that of other countries. The quotation from Angelo Mosso's "La Democrazia nella Religione e nella Scienza," was especially to the point. That author says that no one expects to find real freedom in an American university! Is this true?

I call attention to this statement of Mosso not to air any personal views, but in the hope of eliciting the opinions of others who have had opportunity for wider experience in our academic life. The functions and powers of American college presidents, to which Professor Webster refers, are, at least, not difficult to account for; and one is not puzzled to understand how a leading university president could speak to a European audience last summer of the "poor college professor." But why Europeans should think there is little *academische Freiheit* in the United States, is a matter of more concern. It implies a criticism which goes to the very heart of our American life.

Is it the case that in a democracy, if there be such a thing, the wealthy and the privileged classes identify themselves with the university life—not as professors, but as trustees or benefactors, both of State and privately endowed institutions—and otherwise assume the position of authority which in monarchies or the older kind is occupied by the court or its hangers-on? In England, the universities have always been hostile to reforms and nearly always friendly to the court; in Germany, the university asserts its position as against both court and aristocracy; in Italy, it is the seed plot of Socialism; with us the academic life is said to be a bulwark of conservatism. If these statements are true, shall we admit that in England and the United States, the great teachers, the scientists, will generally be found on the side of reaction, of restraint, of privilege?

One thing is certainly true, all the colleges of the South before 1860 were positively and aggressively on the side of slavery in the prolonged conflict which ended in war; and I believe it is correct to say that nearly all of the schools of the North were opposed to Lincoln and the party of reform in 1861; and few will deny that the overwhelming majority of university and college men were, and still remain, indifferent or hostile to the reform movement of 1896.

This brings us back to the query: Is expert opinion, trained thinking, necessarily opposed in democracies to the feelings and

aspirations of the masses, who, in the final analysis, pay the bills, whereas in aristocratic societies, the reverse is true? It should seem to be so; and for the avowed reason that some one must "take care," some one conserve the heritage of the past, say what is true and what is "good form." If there be no king, we must create one. As Professor Mosso says, "where liberty is greatest, there tryanny is greatest." If this is the case, do we not run a very much greater risk of discord and civil war than the Germans whose teachers hold nothing quite so sacred as their privilege—and this privileged status, not high salaries, is what gives them their authority—to "say their minds" on all proper occasions?

How is democracy to get the greatest good from learning and from highly trained minds? Can we, for example, build up a public sentiment like that which supported Mommsen in his famous fight with Bismarck, a sentiment which will guarantee the greatest possible freedom to the best thinkers? How shall we attain a freedom independent of environment, of large endowments, of social fashion, and of popular feeling, so that a college teacher may publicly avow socialistic views in the South or vote the Democratic ticket in the North? Such liberty exercised with scholarly balance and with the firmness of real learning might be a priceless boon to us in the way of avoiding revolutions or wars like that of 1861.

WILLIAM E. DODD.

University of Chicago, October 25.

"THERE IS NO PEACE."

TO THE EDITOR OF THE NATION:

SIR: In your issue of September 23 you publish a letter from Mr. Edward Ginn, in which he sets forth an elaborate proposal for the founding of a school of international peace. As a Hindu, I cannot but view with joy the progress that the world is making towards large and noble humanitarian ideals. But as an Indian Nationalist, I beg permission to record a most emphatic and unqualified protest against a proposal that is dishonest, immoral, and subversive of all true humanitarianism. Peace and humanity, sir, are words indulged in by Saxon, Latin, and mongrel races as a cloak beneath which to conceal their aggressive militarism, their spread-eagle imperialism. Being free and independent themselves, they seek to support each other, by pretensions of mutual amity, in the work of robbery and vandalism that they have accomplished at the expense of "weaker" races. But the fact remains that there are subject races groaning under the tyranny of unscrupulous alien despots. There are the Irish, the Poles, the Indians, the Egyptians, and the Africans that have yet to be emancipated to take their proper place in the work of the world. And so long as their subjection continues we shall destroy every vestige of international peace in the Old and the New World, until every country shall be free, independent, and self-governing.

Peace and Humanity are very different things from this European cant of peace and humanity—born of colossal ignorance, unfathomable irreligiousness, unscrupulous selfishness, and inordinate conceit. There can be no peace until every race now subject shall have trod the red road to national freedom by the ruthless destruction of all tyranny and despotism. Not until there is national independence and international equality can we allow any talk of international peace and the abandonment of the horrors of war.

VIRENDRANATH CHATTOPÁDHYÁYA.

London, October 15.

SOPHIE JEWETT.

TO THE EDITOR OF THE NATION:

SIR: Sophie Jewett was almost a member of my family from her childhood, and her life and the plans she cherished for future work are well known to me. For this reason only, I beg to add a few lines to your brief and appreciative notice of her in a recent number.

Ad carmina condenda nata, her poetic feeling found expression throughout her childhood. More than one of the poems in "The Pilgrim" were written before she was twenty. She was only a few years older when she wrote "To-day's Daughter" for a Smith College commencement. During more than twenty years her poems, and quite recently her prose, have been appearing in the periodicals. Her poetic gift enriched her teaching. She was, too, an eager student; a frequenter of the libraries of Oxford and London, Rome and Florence, no less than of Boston. Milton's soleeism, "fairest of all her daughters," might be applied to her by a slight change, "most devoted of all her students." Yet she brought more than erudition to her Wellesley College classroom, and there was always something creative in her interpretation of poetry.

Miss Jewett's ready wit and her literary enthusiasm were never more brilliant than during the last months of her life. She had just published her masterly translation of "The Pearl" from the middle English into stanzas of the original complicated form and reiterated rhyme. She was at work on the transcription and translation of representative groups of folk-ballads in Romance languages and dialects. She might have added a few other ballads, but the collection as it stands is complete, and material is left for introduction and notes. This book will be published at an early day. Another piece of unfinished work is her translation of D'Annunzio's "The Daughter of Jorio." Extended passages are completed.

All of her critics have spoken of the wide range of her poetry. Her descriptive poems reproduce with vivid fidelity the very colors and sounds of nature, and the familiar outlines of the cities she loved:

> I see the far, fair city swim
> Through mists of memory bright yet dim
> Shining, even as it shone of old
> Through Arno's haze of subtile gold,
> By witchery
> Of distance, light and evening spun.
> Tall cypresses against the sun
> Distinct I see,
> Defiling darkly up the hill,
> As when we wandered at our will
> In Italy.

Splendid notes of indignation, courage, and faith are sounded in the poem "To Catherine Breshkovsky" (published two days after Miss Jewett's death), and in the ode which commemorates "the story of the Narva Gate." Even more characteristic are the poems which express an abiding consciousness of the endlessness of love and the victory of life over death. One finds this feeling in the rondeau, "If Spirits Walk," and in the lyric of simpler form, "Tasting the Wine of Death":

> Tasting the wine of death he found it sweet;
> Drank deeper draughts and only smiled the more;
> As if he touched the hand that held the cup,
> As if he saw the Christ look down on him,
> Content he whispered, "Lord, I drink to Thee."

WOLCOTT CALKINS.

Newton, Mass., October 29.

"THE WAY TO RESUMPTION."

TO THE EDITOR OF THE NATION:

SIR: In your editorial note, October 14, on abolishing tips, you allude to "Horace Greeley's maxim," "The way to resumption is to resume." Was not Salmon P. Chase the true author of the phrase? It occurs in a letter from Chase to Greeley, dated May 17, 1866, which can be found in Schucker's "Life of Salmon P. Chase," p. 410 (D. Appleton & Co., 1874).

NATHAN J. MILLER.

New York, October 25.

Literature.

"OLD UNHAPPY FAR-OFF THINGS."

Recollections of a Long Life. By Lord Broughton (John Cam Hobhouse). With Additional Extracts from his Private Diaries. Edited by his daughter, Lady Dorchester. 2 vols. New York: Charles Scribner's Sons. $6 net.

Byron: The Last Phase. By Richard Edgcumbe. New York: Charles Scribner's Sons. $3 net.

The books that Hobhouse published in his lifetime are now well forgotten, nor do we commonly stop to think that the elaborate notes to "Childe Harold" were from his pen. He is remembered as the friend of Byron, who travelled with his lordship in his first long journey to the East. Yet Hobhouse was a man of some note in his day, was fairly effective in Parliament, and a supporter of more than one beneficent reform. As early as 1817 (he was born in 1786) George Ticknor, who met him in Venice, speaks of him as one "who, after a youth of dissipation, has now become a severe student." The two volumes here edited by his daughter, and published (in London) by the descendant of Byron's "My Murray," are made up of selections from a vast mass of papers—autobiographical records, diaries, books, etc.—and bring his life down to 1822; there are indications that other volumes are to follow.

It must be confessed that as a whole these pages are pretty thin reading, being filled out with the ordinary "dined here," "went there," "met so-and-so," which a man records for his own memory and not for the world. The account of the first journey with Byron, for instance, is particularly jejune. Here and there a good anecdote slips in, such as the remark of Schlegel (Heine's "Au-

gust Wilhelm") to Madame de Staël's complaint that German literature was on the decline: "Quoi, Madame, vous oscz dire ça du pays de Frederick Schlegel devant William Schlegel!" Here and there, too, we get a glimpse of the older society, such as this curious comment on the narrowness, the family exclusiveness, so to speak, of eighteenth-century England:

Lord Holland told that such was the aversion formerly to foreigners that old Meynell said one day, after the American peace was made, "I wish we were all safe and at war again." Lady Holland mentioned, she remembers, when it used to be said on the invitation cards: "No foreigners dine with us."

But altogether the most interesting sections of the book are the chapter that gives Hobhouse's impressions of Napoleon at Paris during the Hundred Days, and the vindication of Byron written after the divorce. Napoleon was Hobhouse's hero; he misses no opportunity of recording what he hears of the great man, including a really extraordinary conversation between the prisoner in Elba and John Macnamara; and after the escape hurries over to Paris, in defiance of all his friends' warnings, to see the Emperor face to face. His portrait gives the usual traits, picked out with considerable vivacity. Evidently, he gazed at Napoleon with a whole-souled curiosity which even that commander of men found a little embarrassing, for twice it is recorded that Napoleon withdrew his gaze. But there is something more than the curiosity of the idle sightseer in Hobhouse's feeling. The awe and tragedy of power are not often more finely expressed than in these words:

I positively found my eyes moistened at the sight of the world's wonder—the same admiration of great actions which has often made me cry at a trait of Greek or Roman virtue caused this weakness; but I do not know that if Napoleon had not then stood before me as the man against whom all Europe was rising, and as the single individual to dethrone whom, or rather to destroy, a million of men were rising to arms from the banks of the Tanais to the Thames, that I should have felt such a sensation. No; there was something of pity, however unreasonable and unnecessary perhaps, which made me look upon him with such gratification and melancholy delight. Add besides the reflection of his recent exploit, the most wonderful of all his actions, and I am not astonished or ashamed at having experienced such feelings at the sight of the man who has played the most extraordinary, gigantic part of any human being in ancient and modern times.

But by far the most important section of these two volumes is the long concluding chapter which contains a detailed account of Lord and Lady Byron's unfortunate marriage and quarrel. The document was written by Hobhouse in 1816, immediately after the divorce, as a justification of his friend, to be published in case any attempt were made to fasten upon him the crimes which were not only the common scandal of the day, but the unavowed cause of Lady Byron's action. Though no allusion is made by the present editor to the infamous "Astarte" privately circulated in 1905 by the late Lord Lovelace (Byron's grandson) but everywhere discussed, it may be supposed that its attempt to prove the old charges against Mrs. Leigh are the occasion of the present publication, and of this renewal of the *infandum dolorem*. It should be premised that Hobhouse does not undertake to exculpate his friend of conduct which would justify Lady Byron in seeking a separation on grounds of incompatibility of temper. It is evident that Byron at that time, owing to pecuniary annoyances and to restlessness under the restraints of a marriage upon which he entered with misgivings, if not with repugnance, was in a state of excitement approaching phrensy. On that ill-fated day, January 15, 1816, when Lady Byron with her child left Byron's home to visit her parents, she believed, and was fairly justified in believing, that her husband was suffering from that form of mania (it is a common trick of hysteria) which turns its victims to hatred of those nearest and dearest to them. Throughout his life, as can be proved by abundant testimony, Byron affected a kind of diabolism which only amused his intimate friends; during his year of marriage he evidently displayed this trait to his humorless and unimaginative wife in the most exasperated manner. She thought it insanity; on being assured by medical counsel that he was morally responsible, she accepted his diabolism as a fact and was ready to believe any charge against him. She refused to return to him, and forced a separation. Hobhouse asserts positively that while his wife was with him Byron, with one passing exception of which Lady Byron was apparently ignorant, had given no statutable cause of divorce. She was forced, therefore, in applying to the Commons for separation, to place secretly in the hands of her "civilian," Dr. Lushington, what evidence she possessed of those charges of guilty connection with his half-sister, Augusta Leigh, and of another crime which Hobhouse characterizes as "more enormous" but "less terrific," *i. e.*, less likely to be believed. Into the details of the affair we have no desire to enter. We believe that Hobhouse's document gives ample proof, if such proof were necessary, that these accusations, particularly the former, were unfounded. They seem, at least the former of them, to have sprung from the evil imagination and prying curiosity of Mrs. Clermont, the servant-friend, who lived with the Byrons in London, and whom Byron has sketched as

Born in the garret, in the kitchen bred,
Promoted thence to deck her mistress' head.

. . . . . .

Exalted o'er thy less abhorr'd compeers—
And festering in the infamy of years.

At first Byron sought to keep the quarrel out of the courts, but when, after much inquiry, he discovered the true nature of the charges against him, he took the advice of his friends and demanded complete legal investigation. He desisted from this demand only when Lady Byron appealed to him in a letter to forego; that letter is given in full by Hobhouse. Further, Wilmot secured the signature of Lady Byron to a paper stating that she had not spread the rumors injurious to Byron's character, and that neither of the two specified charges would have made part of her allegations in court. Lady Byron, indeed, cannot be exonerated from a certain taint of duplicity through the whole affair and through her subsequent conduct. As a single example, the letter (now first published) may be quoted which Lady Byron wrote to her husband the day after leaving him:

DEAREST DUCK,—

We got here quite well last night, and were ushered into the kitchen instead of drawing-room, by a mistake that might have been agreeable enough to hungry people. . . . [There is nothing in the printed text to indicate what these points signify.] Of this and other incidents Dad wants to write you a jocose account, and both he and Mam long to have the family party completed.... Such . . . ! and such a *sitting*-room or *sulking*-room, all to yourself. If I were not always looking about for B[yron] I should be a great deal better already for country air. *Miss* finds her provisions increased, and fattens thereon. It is a good thing she can't understand all the flattery bestowed upon her. "Little angel" . . . and I know not what. . . . Love to the good goose [their pet name for Mrs. Leigh], and everybody's love to you both from hence.

Ever thy most loving,
PIPPIN . . . PIP . . . IP.

It is not surprising that Byron was astounded when five or six days later, Lady Noel (his wife's mother) and Mrs. Clermont came to London to secure a separation between the couple. Lady Byron scarcely mended matters by stating, afterwards, that she had written the letter under a physician's advice to soothe Byron and save him from a paroxysm of madness. The abruptness of Lady Byron's change of front, despite her own explanation, is a mystery which has not been cleared up.

Two entries in the journals of George Ticknor show in a measure the fearful effect on Byron of his public disgrace. In the summer of 1815, the American traveller visited Byron and his wife in London, and records that his "manner to her was affectionate; he followed her to the door, and shook hands with her, as if he were not to see her for a month." In October of 1817, Ticknor was

in Venice and was asked by Lord Byron to spend some days with him. The entry in the journal is brief and sufficient: "An invitation I, of course, felt no inclination to accept, in his present circumstances." Nor was Ticknor particularly Puritanic in his acquaintances.

It is the purpose of the first half of Mr. Edgcumbe's book to give a fuller account than has ever before been brought together of the last episode in Byron's life, which was a kind of redemption of those degraded Venetian years. It cannot be shown that Byron accomplished much for Greece beyond the encouragement lent by his great name to the Grecians and to their friends in England. Death cut him off too soon. But the documents collected by Mr. Edgcumbe do at least set his prudence and tact and humanity in a high light. Nothing, indeed, became his life like the leaving of it, and we regard this portion of Mr. Edgcumbe's work as a thoroughly desirable addition to the Byronic literature. Of the second section of his book, one must speak more cautiously. It is an avowed answer to Lord Lovelace's indiscretion, and if blame is to be properly distributed, the heavier share must fall on the shoulders of him who first reopened the whole scandalous debate. The negative part of Mr. Edgcumbe's argument seems to us fairly convincing; he has rescued Mrs. Leigh from the old infamy, but only by making her an accessory after the fact of an intrigue of Byron with the Mary Chaworth whom he loved as a boy, and from whom he has been supposed to have been entirely separated by her marriage to John Musters.

We cannot, for manifest reasons, go into all the details of this new theory. It has, however, important literary bearings which must be our excuse for touching its main points. In 1808-9, Byron, according to Mr. Edgcumbe, had not forgotten the Mary of his boyhood, but was seeing her at Annesley. Recognizing the danger of this intercourse and driven by her husband, she now avoided Byron, and during this time of separation (1811) the poet wrote to her the Thyrza poems, which have caused so much mystification. In 1813, Mr. and Mrs. Musters were estranged. At this time, Byron and she were again drawn together, and more intimately. On April 15, 1814, a child, Medora, was born to them, which Mrs. Leigh, then with Byron at Newstead (near Annesley), took as her own to prevent scandal. Mary repented bitterly of her fault and was afterwards reconciled with her husband. At the time of the divorce proceedings, she was driven temporarily, by fear of exposure, into a state of mental alienation. To shield her, Mrs. Leigh allowed the charges against herself to go unanswered.

The proofs of this story are in part flimsy; this must be admitted. Mr. Edgcumbe regrets "being unable more precisely to indicate the source of information," and in claiming unrevealed authority, he has, at least, this justification, that Lord Lovelace did not print the letters which would have made his argument, according to his own account, incontrovertible. One surmises that Mr. Edgcumbe has had access to documents preserved by the Leigh or Chaworth-Musters families. He has, on his side, indications that Byron's journal was destroyed because of its revelation of this secret; he draws also strong corroboration from the poems. Even "Manfred," which Lord Lovelace used as a support to his accusation, can be made to fit more perfectly into the new theory. On the whole, without being finally convinced of the part of Mr. Edgcumbe's story bearing on Mary Chaworth, we think that he has made out a strong case. It will be remembered that Moore, who had read Byron's journal and who otherwise was better acquainted than any other man with Byron's whole career, made this declaration in the Biography:

> It may be questioned whether his heart had ever much share in his passions. Actual objects there were, in but too great number, who, as long as the illusion continued, kindled up his thoughts and were the themes of his song. But they were little more than mere dreams of the hour. *There was but one love that lived unquenched through all.*

Critics have commonly held that Byron's profession of a single life-long passion for one named Mary was but a part of his romantic pose. It will be a curious outcome of a disagreeable, if not nauseating, dispute, if he shall be established as one of the great lovers of literature. Such a result would add a new meaning to the words "sincerity and strength," which to Swinburne and Matthew Arnold were "the splendid and imperishable excellence" covering all his offences and outweighing all his defects. It is because the negative testimony of Hobhouse and positive theory of Mr. Edgcumbe may possibly bring about so important a revolution in literary criticism and so enhanced an appreciation of the works of one of England's greatest poets, that we have written at such length and with such frankness of these far-off unhappy things that might otherwise have been best judged by silence.

CURRENT FICTION.

The Moccasin Ranch. By Hamlin Garland. New York: Harper & Bros.

Here Mr. Garland has afforded what many of his early admirers must have been waiting for: another adventure upon those "main-travelled roads" to which he first guided us now a good many years ago. No one had made us feel certain aspects of Middle Western pioneer life as he made us feel them—its racially composite nature, its toil and sweat, its everyday romance. These early stories were, as Mr. Howells said at the time, "full of the bitter and burning dust, the foul and trampled slush of the common avenues of life, . . . full of those gaunt, grim, sordid, pathetic, ferocious figures whom our satirists find so easy to caricature as Hayseeds, and whose blind groping for fairer conditions is so grotesque to the newspapers and so menacing to the politicians." The reader may recall one of those tales named "A Branch Road," dealing with the rescue of a faded drudge by an old lover from the killing morality of wedded slavery. Mr. Garland did not then point a moral; he stated a case; and in "The Moccasin Ranch" he states a similar or analogous case.

Here also an elopement and a desertion are involved, and here also the implication is that events have followed their necessary and normal course. In the later instance, however, the woman's provocation is far less, and the dénouement a mere making the best of a pretty bad bargain. The odd thing about it is the fact that the husband should be left, a mere pathetic fourth person, in the background. The third person, he who, after an impulse to stop and punish the runaway pair, forgives them and sends them off with his blessing, seems to have rather too little at stake to support the rôle of magnanimity thrust upon him. There is, in fact, a touch of strain in the speech and conduct of these four persons. The moving thing is that atmosphere of place which Mr. Garland knows how to make us breathe. These people are settlers in a newly opened stretch of prairie, and their personal drama is a mere incident in the scene:

> The smell of the fresh pines was around them. Geese were flying over. Cranes were dancing down by the ponds; prairie-chickens were booming. The open doorway—doorless yet—looked out on the sea-like plain glorified by the red sun just sinking over the purple line of treeless hills to the west. It was the bare, raw materials of a State, and they were in at the beginning of it.

Along the Way. By William W. Canfield. New York: R. F. Fenno & Co.

The steady increase and multiplication of books of this type must be a challenge to the attention of the reader who takes his fiction respectfully. He must be wholesomely reminded that the function of the modern novel is manifold. It is a tract, a chronicle, a vaudeville turn, a "human document"—least commonly of all a work of art. How judge it, then? The difficulty is somewhat like that of judging the drama. Even if it is to be taken as a work of art, who is the right reader, ὁ χαρίεις, the ideal person at whom fiction should be aimed, and by whom it may be right-

ly estimated? Is it the professional critic, the reader of ordinary or extraordinary cultivation, or the man in the street? The literary critic can find little to say for "Along the Way," for example. It is crude, obvious, half-tract, half-melodrama; its persons have little reality, its didacticism is a nuisance. The action is supposed to take place some ten or fifteen years in the future. The hero is a young engineer who has been abroad in Russia for ten years working at his profession, and who now returns to his native land. Apparently, he has allowed himself to read no American news during his absence, for his surprise at the condition of things in his beloved land is complete. It seems the railways have been turned over to the government, and the government is in process of making a frightful mess of things. Railway officials are now an army of grafters and incompetents. Trains no longer run even approximately on time. Politicians work their wicked way with time-tables as well as with employees, and there is no counting upon anything for the downtrodden public.

Of course, it becomes our young engineer's business, and pleasure, to correct these evils. There are exciting doings in connection with two fair young ladies from Denver, only one of whom, unfortunately, the hero is free to marry; but he rescues them both from a very awkward situation, in which they have been involved by the villain, a high railway official. The villain is driven to earth and gets his deserts, and the railways are restored to private ownership. The quaint and original detail of treatment is that this restoration is brought about by a popular uprising led by a band of patriotic multimillionaires, who have pledged "their lives, their fortunes, and their sacred honors" to the cause of "assisting this stupendous re-transfer" for the good of the people. Their victory is not bloodless. Preaching and sensationalism, fustian and platitude! sighs the critic. Yet the book is written with good purpose, and will no doubt find its own respectful audience.

The Eagle's Nest. By Allan McAulay. New York: John Lane Co.

The justification needed for a novel about Napoleon is that it shall be interesting. This condition is honorably fulfilled in Mr. McAulay's story, which has, besides, two other points of distinction: the nominal hero is not Napoleon himself, but a young Corsican, who is bewitched by him; and the action takes place wholly on Corsican soil. As a sullen, combative child, the conqueror sets out for school in France, and returns an argumentative idealist, a shabby student, a writer of romantic essays, a reader of Boswell and Rousseau—to his fellow-men "a queer fish," an *esprit sec et sententieux.* Yet the piquant mystery of this personality is felt through all these formative days—the power that even now made men follow his smile to bitter ends. There are vivid pictures of the political unrest, as well as of the private life of the untamed island. Paoli, banished as a patriot twenty-odd years before, is here restored to his islanders, and entertains secret schemes of English aid in ousting France. The Corsican-Italian-French-English tangle makes a stirring theme, while counter to it run the private pipings of the young "Nabulione" with his family interests and his as yet unformulated ambitions—and of the young Domenico, who walks down from the hills to Ajaccio and into the intimacies of the Buonaparte circle. The whole is written with a controlling sense of proportion in the distribution of history, geography, manners, landscape, character-drawing, and invention. This happy art, added to a fine dignity of construction, puts the novel quite above the too fluid current of modern historical romance.

The Wares of Edgefield. By Eliza Orne White. Boston: Houghton Mifflin Co.

This story leaves one with the impression of real power somehow missed; one is interested in the uneventful but human chronicle of the Wares and their connections, and pursues from page to page an elusive beckoning hope of the genuine master-touch that will give it all authority and significance. But though the writer plainly states her keynote—Sympathy—at the story's end we are left disappointed. The vital spark is lacking. It is something, however, to hold the reader's attention through an amiable ambling narrative of little doings, whose occasional attempts at lurid contrast are but too evidently mechanical shifts.

THE NEW WEBSTER.

Webster's New International Dictionary of the English Language. Editor-in-chief, W. T. Harris, Ph.D., LL.D.; General Editor, F. Sturgess Allen. Springfield, Mass.: G. & C. Merriam Co.

The standard books of reference have reached a point in evolution where further growth must run to thin paper and small type. We may regret the passing of the heavy page with its ample margin and generous print, just as we regret the lofty ceilings and broad staircases of our ancestors; life grows crowded with many people and many words. Dictionary, biographical lexicon, political almanac, and handbook of statistics, in every new edition, corroborate Malthus. The editors of the newest Webster, "the latest authentic quarto edition," call attention to the successive accretions of time, from 70,000 words in Noah Webster's first edition, to 114,000 words in the Unabridged of 1864, to 175,000 words in the International of 1890, to nearly 400,000 words in the present "New International." In 1900 a supplement of some 25,000 words was added to the 1890 edition. The latest revision, therefore, holds double the vocabulary of ten years ago. The great increase is largely accounted for by the expansion of encyclopædic matter, which constitutes one of the important changes in the volume before us. The publishers have aimed to make their dictionary a handbook for "the common man, woman, and child as they read their newspaper, book of travel, or novel." Consequently, where the edition of 1890 gave a column and a half to "grass," the "New International" gives more than a page with a list of, we should say, five hundred species.

A novelty of make-up, introduced, we are told, for greater convenience in consultation, is the division of the page into two sections. The upper section holds the main vocabulary; to the lower division, a sort of lexicographer's limbo, have been relegated unfamiliar words, obsolete words, and all the encyclopædie matter contained in the special supplements to the 1890 edition—proper names, foreign phrases, etc.—with the exception of the gazetteer and biographical lists. On æsthetic grounds, the change does not eommend itself. It is probable, on the other hand, that when the reader has learned to look for the more familiar term in the upper section and for utterly queer-looking words among the proletariat below stairs, there will be a saving of time. It is evident that there could be no hard and fast rule for separating the sheep from the goats. We find, for instance "Delzenne's Circle" in the upper section of the page when we should be inclined to look for it below the line, or, better still, among the encyclopædie data under "circle." In the edition of 1890, "delftware" was followed by "deliblate." In the new edition the two are separated by "Delia," a goddess and a shepherdess; "Delia," a Greek festival; "Delian," the adjective from "Delos," and, below the line, "Delhi boil," "Delhi sore" and "Delhi work."

The new edition is conservative on the mooted question of spelling and decidedly progressive on the question of neologisms and slang. The Websterian prefcrences of "meter" and "center," and the single "l" in "traveler," are retained. The claims of reformed spelling are thrown out of court. The forms proposed by the Simplified Spelling Board are unsafe to deal with, "since not only is it impossible, as yet, to tell what the result of the movement will be, but also the changes proposed by this board are being added to so rapidly as not to admit of their being recorded." Thus, while the changes recommended by the Philological Society of

England and the American Philological Association have been incorporated, and "program," "catechize," "criticize" have the preference, there is no mention even for poor "thru" and "tho." An innovation that calls for notice is the admission of "labour," "honour," etc., to equal rights with the American forms. For an international dictionary the step may be proper enough, but the American reader might have been warned that the "u" forms are English usage, and not alternatives for the shorter spelling.

A "chronicler of existing usage" in spelling, the New International is extremely susceptible to the appeal of slang. We are reminded that "historically, slang has been one of the experiment stations in which verbal candidates are tried out." Hence the inclusion of "bluff," "stand-pat," "cinch," "rough-house," and "make good." Do the editors imply that all those terms have been tried out in the laboratories of philology and received a title to immortality? We doubt it. We find no aspect of inevitability about "gold-brick" and "peach," to which the book extends its hospitality. As a matter of fact, the editors fall into speedy contradiction. "Their test-question has been: Is this word likely to be looked for by enough readers, within the next few years, to entitle it to a place?" But the reader who would turn to Webster's pages for "rough-house" or "peach" might also look for "talkfest," "hot air," and "pazaza," and be disappointed. Virtually "within the next few years" means that if a bit of slang has failed to hold its own we can drop it in the next edition. That was not Dr. Johnson's idea of the functions of a dictionary.

In the revision of the definitions, the editors' claim that they have reinforced the existing lucidity and exactness with a "closer analysis, a more historic order, and a fuller presentation," is, on the whole, justified. Since the Oxford Dictionary, no lexicon can overlook the importance of copious citation. We notice, however, that often the changes in definition have been changes of arrangement. The subdivision of definitions has sometimes been carried to an exaggerated point of refinement. It is doubtful, for instance, if the increase in the number of separate definitions for "baby," from two to seven, has brought a corresponding increase in the value of the article as a whole. Under "delicacy," the single obsolete usage of 1890 has grown to three. That, however, involves a fine point of lexicographical technique on which we do not care to pronounce. We do find the treatment of synonyms very satisfactory. The subject is handled with a degree of completeness that raises up a formidable competitor to the thesaurus. The etymologies have been revised by Professors E. S. Sheldon and Leo Wiener of Harvard.

The Babylonian Expedition of the University of Pennsylvania. Series A. Cuneiform Texts. Edited by H. V. Hilprecht. Vol. VI. Part 2. Babylonian Legal and Business Documents from the Time of the First Dynasty of Babylon. By Arno Poebel. Philadelphia: Published by the Department of Archæology, University of Pennsylvania.

This volume follows the same plan as the preceding volumes of the series. Dr. Poebel, to whom we owe its preparation, was formerly Harrison research fellow in Assyriology at the University of Pennsylvania; and from his preface we learn that the present book grew out of the dissertation presented by him in 1906 for the degree of doctor of philosophy.

The body of the work consists of facsimile reproductions of tablets, 138 in all, with a few half-tone reproductions. These are preceded by a series of dissertations, suggested by the contents of the tablets. We have, first, the transliteration and translation of tablets displaying the various schemes of legal documents; from which it would appear that regular blank forms were in use, differing slightly at such places as Nippur, Sippar, Babylon, etc. Then follows an explanation of the peculiar form of seal impressions on certain of these documents: impressions taken, not from the usual small cylinders of hard stone, the personal and often inherited property of the signer, but from small, rectangular slabs, made, expressly for the occasion, of some soft material easy to cut. Particularly interesting is a list of the date formulæ used by the Kings of the first Babylonian dynasty, with a discussion of the method pursued in naming the year: either after events of importance; or after religious ceremonials, or the dedication of statues and the like, at the feast of the new year. In Hammu-rabi's reign the dates generally stand for events—the year in which he took Erech and Isin, the year in which he built such and such a canal—and reveal the steps by which that monarch established and organized a kingdom stretching from the Persian Gulf up the middle Euphrates almost or quite to Carchemish, and up the Tigris to and beyond Ashur. The tablets of the later kings, on the other hand, are dated, rather, after religious events, the erection of statues, and the consecration of temple ornaments; indicating the decadence of the dynasty. Next we have a discussion and, to a certain extent, a reconstruction of the political history of a part of this period, in the light of these date formulæ. There is also a concordance of the proper names found in the tablets, a subject to which much space has been given in all these volumes; and, finally, a table of contents and a descriptive catalogue, showing, so far as it is known, the provenance of each tablet, the king to whose reign it belongs, and its year in that reign.

The tablets here published cover the reigns of five kings of the first Babylonian dynasty, from Hammu-rabi to Ammi-zaduga, with two kings of the dynasty of Larsam, Warad-Sin and Rim-Sin, Hammu-rabi's great rival and opponent. The Nippur tablets are derived almost exclusively from the earlier expeditions of the University of Pennsylvania (1888-90), like virtually all the material published up to the present time. The provenance of the tablets is very imperfectly given, but, from the introductory remarks of the editor, it appears that they were found, for the most part, in that part of "tablet hill" claimed by Hilprecht to have been the business section of the temple library of Nippur. As Dr. Poebel points out, the contents of these tablets prove the contention of the earlier excavators that there was no temple archive here, but that this section of the city was occupied by private houses of bakers, carpenters, and the like, in which the documents were preserved not in one or several large collections, but two or three in one place, half a dozen in another, in jars, or buried under the floors. But wherever the owners of these tablets lived, whether in "tablet hill," to the east of the great canal, or in the still more extensive ruins to the west, from which some of the tablets were derived, their business was largely connected with the temple of Enlil, the great god of Nippur, or with the minor temples of other gods of the same city. Clearly, Nippur was at this period a sacred city, not a political centre.

Some of these tablets deal with the sale or transfer of temple offices, which were treated as property inherited and transferable in the same manner as house and land. The oldest brother received a special portion, apparently half of the total estate, in which the temple offices were rated at a money value, and the remainder was distributed share and share alike. Among the more interesting documents are those dealing with adoption. This appears to have been a regular business procedure, by which parents provided for their support in old age. The person adopted was obligated to pay a certain annual sum to his adoptive parents, he on his part inheriting their property or a certain specified portion of it at death. In some cases the adopted child was purchased from his real parents, and in case of his failure to pay to the adoptive parent the specified annual sum, he was liable to be sold as a slave. Daughters, also, might be adopted. So we have one case where a woman purchased the daughter of another, to make her a "votary," with the stipulation that she should "eat" the "votary's" earnings.

Besides the tablets from Nippur, this volume contains also a considerable number discovered at other sites, notably Sippar and Borsippa, and purchased by the earlier explorers. There are also two or three documents discovered by the second expedition in a ruin-mound called Yokha, at two days' journey from Nippur, the ancient name of which has not yet been identified. In execution, this work maintains the high standard of handicraft and calligraphy established by its predecessors, while the introductory dissertations add considerably to our knowledge of ancient Babylonian history, domestic and religious life, and legal right.

The Life and Times of Master John Hus. By the Count Lützow. With illustrations. New York: E. P. Dutton & Co. $4 net.

This life of Hus by a fellow-countryman, written in English and addressed especially to English-speaking people, is an obviously partisan work. Its apologetic tendency is, in fact, put forward as an additional reason why the author should have taken especial pains to examine carefully and weigh thoroughly all hostile criticism of his hero. This rather unusual claim is well sustained by the book itself. It is written in a spirit of ardent admiration for the man who stands in the author's mind as the chief representative of their common fatherland, yet with admirable temper and evident anxiety to do justice to all reasonable opposition. Count Lützow's thesis is that the work of Hus was, in a very complete sense of the word, independent, a truly national and personal movement. He has felt himself called upon to open the subject at this time on account of vigorous efforts that have been made to reduce the personal merit of Hus to the lowest point, by showing his dependence upon others, more particularly upon John Wycliffe. The epoch-making work of Palacky, published more than fifty years ago, brought out clearly enough, one would suppose, the essentially Bohemian character of the Hussite movement; but since then a wave of German criticism led by Johann Loserth has almost swept away this fundamentally national quality of the Bohemian struggle. In his striking little book, "Hus und Wiclif," Loserth undertook to show that all that was significant in Hus's thought was derived by an almost purely mechanical process from Wycliffe. Even the "deadly parallel column" was invoked to make it perfectly clear that Hus actually copied word for word from Wycliffe in many extended passages. All that had a very convincing sound, but it required no very great familiarity with the literary processes of the time to show that even direct copying of literary material was no proof of dependence or even derivation in thought. What was written became common property and was freely appropriated by any one who found it serviceable in supporting his own ideas. The ideas were not, on this account, any the less his own. Such criticism as Loserth's was a challenge to the admirers of the Bohemian saint, and Count Lützow has accepted it.

It cannot be said that he has contributed any considerable amount of new material to the discussion. What he says has been said before, but he has put it in attractive form and has directed his argument straight toward the criticism designed to undermine it. We are inclined wholly to agree with him that Hus represents the culmination of a long and deep-seated discontent with the administration of the Church in Bohemia, and also with the existing doctrinal teaching of the Church in so far as that was used to support the practices then being called in question. Hus had his forerunners in Bohemia as obviously as Wycliffe had his in England. The movement in each case was complicated throughout with national considerations. It is no derogation from the merits of Hus to admit, as Count Lützow freely does, his obligations to Wycliffe, but it is a long way from that to making him an almost servile copyist whose work could not have been done without the help of his English predecessor.

Perhaps the most vivid impression retained by the general reader will be that of the conflict of the pure Bohemian element against the apparently rapid Germanisation of their country in all that pertains to the higher life. It is easy to describe this as evidence of a narrow Chauvinism, unwilling to receive the light except through a nationalist medium, but it is a conflict bound to appeal to every reader who values the force of a true patriotism that prefers its own way of salvation to the most benevolent assimilation.

The Hisperica Famina. Edited with a short Introduction and Index Verborum by Francis John Henry Jenkinson. Cambridge: University Press New York: G. P. Putnam's Sons. $1.75 net.

One of the most interesting problems in the history of the early Middle Ages concerns the nature of the contribution made to civilization by Ireland. According to roseate accounts of the matter, culture, including a substantial knowledge of Greek, flourished in the isle of saints from the middle of the fifth to the seventh century, during most of which period the continent lay buried in utter darkness; from Ireland proceeded the enlightening influence that brought learning back to Europe. M. Roger, in his careful but unsympathetic work, "L'Enseignement des lettres classiques d'Ausone à Alcuin" (1905), vigorously attacks this view. He acknowledges a familiarity with Greek on the part of Pelagius at the beginning of the period, and of John the Scot after its termination, but seeks to show that what culture Ireland possessed in the interval was insignificant, and may even have come to it from without.

The "Hisperica Famina," which Mr. Jenkinson, librarian of the University Library at Cambridge, has carefully edited, with its various texts, is one of the wildest things in literature. The strange dialect is a fusion of classical Latin, vulgar Latin, Greek, Hebrew, and perhaps some independently created elements, all cast in a mould that in general is Latin, but not what Cicero would have recognized as such. It is evidently an academic, not a popular product, and may be located on the borderland between esoteric refinement and drivelling nonsense. The subjects treated are simple enough—the praise of the scholar, a description of the daily life at the school, and what appear to be set themes, such as *De cælo*, *De mari*, *De taberna*, etc. The name Hisperic, scholars recently have believed, emphasizes the fact that the *Famina*, or diction, is Roman, in contrast with the base vernacular. In the "Glossæ Collectæ" of the Echternach manuscript, *Hisperica* is the last word explained, but, tantalizingly, the explanation is not legible. Bradshaw thought he read *scotica*, but nothing can be made out now. There are approaches to the new style in several late Latin authors, particularly Martianus Capella and Virgilius Maro, but it goes far beyond anything in such authors. Various specimens of it exist, the earliest published by Cardinal Angelo Mai in 1833, and all conveniently assembled in Mr. Jenkinson's book.

His edition is a distinct improvement on that of Stowasser, for more reasons than that it includes more. It contains facsimiles and reproduces the text exactly, without the disfigurement of emendation. The text is for the first time printed as lines of poetry, the nature of which has long been recognized by Bradshaw, Zimmer, and Wilhelm Meyer. The manuscripts themselves give a continuous text, but generally mark the ends of verses by punctuation, and their beginnings by capital letters; and Mr. Jenkinson's introduction includes a more careful description of these manuscripts than had before appeared. The complete Index Verborum has also something of the nature of a glossary, including references to the Echternach glosses; this feature might well have been developed still farther.

Now the significance of these curious documents for the problem stated at the beginning of this review is just this. If Ireland, as is probable, may be accredited with the invention of Hisperic

diction, we have apparent evidence that the knowledge of Greek, which it presupposes, was not altogether at second-hand. Mr. Jenkinson shows that there is no dependence on the Græco-Latin glossaries of the early Middle Ages; he believes that "the jargon represents an isolated growth or tradition of which whatever literary product there may have been has mostly perished." Further, if Gildas, the British historian of the sixth century, was acquainted with Hisperic—and Mr. Jenkinson adds a bit of confirmatory evidence on this disputed point—the existence of the dialect is proved for the very period when, according to Roger, Ireland was destitute of Greek. Finally, may it not be, after all, that the movement had a more popular nature than we suppose? After we become accustomed to the peculiar verbiage, we find it not inconsistent with poetic feeling. Mr. Jenkinson, after quoting the verse, *multiformis solifluis: pretenui nubium vapore sicmicatur arcus radiis*, remarks:

> We are left to wonder how such a vocabulary came to be associated with such artistic feeling. It is not enough to suppose that behind the Latin expression may stand thoughts conceived in native Irish. That seems likely enough. But apart from that, there is a directness and freedom in the expression itself which, as far as I know, cannot be matched among other remnants of contemporary literature.

It is easy to ask questions on a subject about which we really know next to nothing. As most of the fragments have come to light in most unexpected ways, it is not too much to hope that some *felice scopritore* may add others still, to supply more evidence on this fascinating subject.

Economic Heresies: Being an Unorthodox Attempt to Appreciate the Economic Problems Presented by "Things as They Are." By Sir Nathaniel Nathan. Boston: Houghton Mifflin Co. $3 net.

The sub-title indicates the purpose of this volume: it attempts to depict the industrial world from a positive, or objective, standpoint in contradistinction to the *à priori* idealization which its author imputes to the professional economist. Sir Nathaniel Nathan has some unusual qualifications for the task he has set himself. He has had a long acquaintance with public affairs. As a former burgess of Birmingham, he knows municipal trading from the inside. As attorney-general in Trinidad, he has seen much of the practical side of international trade. He knows the "service traditions" of the Crown's civil servants to perfection. His long absence from England has emancipated him from partisan allegiance, and his weighed deliverances upon England's national policy, financial and industrial, are courageously impartial. If in fairness one ought to temper this praise, it may be suggested that the author's views of foreign trade may have been unduly colored by his knowledge of the struggles of the West Indian sugar-grower; also that a busy officer of the Crown has hardly time to keep in touch with much of the best recent work in economics. In particular, Sir Nathaniel's acquaintance with American economics, so far as one can judge from this book, seems largely confined to Henry George, Upton Sinclair, and W. J. Bryan.

In a treatise so comprehensive as this, it is impossible to notice more than two or three of the important positions assumed. Perhaps its quality may best be indicated by noting, first, its somewhat novel use of the concept "means"; and then by scrutinizing its theory of tariff reform; and its verdict upon Socialism.

There is much to justify the insistence upon some such term as "means" in contradistinction to the term wealth. Wealth is employed by the author to cover what are generally known as commodities—"desirable material things susceptible of appropriation, excluding money . . . and also [excluding] . . . land" (p. 20). "Means," on the other hand, denote "the man's power to obtain commodities, . . . the whole of the accumulation of varying evidences of his title to participate in wealth" (p. 22). This distinction between two aspects of wealth has been implied, or even explicitly exploited, by several modern economists. F. A. Cleveland's "funds" are the analogue of Nathan's "means." The same is true of Davenport's "loan funds" which he contrasts to actual material "wealth used as an aid in the reproduction of wealth." T. Veblen's "loan credit," portrayed as "a pecuniary fact, not an industrial one," is also akin to Nathan's "means"; and Irving Fisher's "rights" of "obtaining some or all of the future services of one or more articles of [material] wealth" are of the same genus as "means."

The relation of "means," or claims upon wealth, to actual goods is a *locus vexatissimus* of economic casuistry. The view commonly imputed to Macleod that the creation of such claims is tantamount to the simultaneous creation of an equal amount of wealth is certainly one extreme of error. Making out the title-deeds to a farm and putting them on the market is certainly not a doubling of wealth. On the other hand, the view of Professor Irving Fisher that "existing property rights (claims) are rights to the use of existing wealth, so that *existing* wealth underlies all *existing* property rights" seems also extreme. A government bond promising interest for fifty years is, at least in part, a claim on the income to issue from the labor of the unborn. *To that extent* no existing property, either material goods or human producers, underlies the bond. The truth seems to be that "means," "claims," "credits," "rights," may or may not imply the contemporaneous existence of correlative material wealth; may or may not connote well founded correlative expectation of future income.

Without attempting to index the various places where his conception of "means" betrays our author into what seems to us to be error (as, for example, pp. 251, 252), it will suffice to say that it leads him to deny the essential truth of the barter theory of trade, either domestic or international. Thus he declares that "any attempt to treat of commerce as a regulated process of 'barter' or 'exchange of commodities' *inter se*, simply facilitated by the employment of money as a sort of denotation of market values, issues in fallacy and confusion" (p. 119); and again that "neither nations nor communities conduct commercial operations by way of barter or exchange of goods at all . . ." (p. 308). It follows logically that a nation's power to obtain imports depends not on its material exports, but on its "means" available for purchasing foreign produce. Apparently then a nation can obtain goods from abroad without selling goods to the outside world. So far as an accretion of "means" arises from the income on investments abroad or from freights earned on carrying the world's commerce, no one would dispute the allegation. But it seems almost a childish proposition to insist upon, that apart from the credits arising from sources similar to the two just mentioned, the export of commodities creates the claims that suffice to defray the cost of the residue of imports. If certain commodities, instead of being imported, begin to be produced at home, and if the productive power of the nation is thus diverted from producing goods for export to supplying the domestic demand directly, the "means" for paying for residual imports is diminished *pro tanto*. So that, after all, the essential core of truth would seem to lie in the traditional statement of the theory of foreign trade—that it is essentially an organized and elaborate system of barter rather than what it seems to be in the individual instance, a purchase or sale of goods for money, or "means." If our author can propound no more plausible "economic heresy" than his doctrine of foreign trade, it should seem that he might content himself with the economic "orthodoxy" he so fiercely impugns. One is reminded of Bacon's remark that "a little philosophy inclineth man's minde to *Atheisme;* but depth in philosophy, bringeth men's mindes about to *Religion.*"

Sir Nathaniel's advocacy of tariff reform, however, is infected with no blind worship of colonial preference by

treaty. "The day for" commercial treaties "that will be economically effective has passed away" (p. 299). The "inflated cant" about the "British Empire" moves him to contemptuous pity (p. 198). His argument for a limited dose of protection is based on the desire to absorb the unemployed proletariat in industry. He thinks internal competition will keep down undue profit, and that improved productive processes will prevent any permanent enhancement in prices to consumers. The "real danger attendant on the adoption of Protection; the principal real argument for adherence to Free Trade," he declares, is the danger of corruption and abuse best illustrated in the United States (pp. 310 sq.).

The best part of this vigorous treatise is the analysis of Socialism. Its attitude to many of the specific proposals of state Socialism is open-minded. One would guess that the pending budget would not necessarily find an enemy in the author. But long experience in office has given him an insight into the limitations of bureaucracies which makes him quite impervious to the blandishments of collectivism. His long official activity in a Crown colony has taught him that "officialdom is essentially the domain of safe and mediocre respectability, the sanctuary of 'use and wont,' discarding all initiative and entrenching itself in precedent" (p. 356); and that "by no process known to us can we attain to the cruel accuracy of the automatic selection of private adventure, which has brought productive industry, competitive commerce, and regulative finance to their effectiveness" (p. 358).

The Historic Exodus. By Olaf A. Toffteen, Ph.D. Chicago: The University of Chicago Press. $2.50.

In a former volume, entitled "Ancient Chronology" (noticed in the *Nation*, May 14, 1908), Professor Toffteen discussed the chronology of Palestine, Babylonia, Assyria, and Egypt down to B. C. 1050; here he undertakes to give the component parts of the Pentateuch, to determine their dates and demonstrate their historical trustworthiness. After examination of a great mass of particulars he reaches the conclusion that P, the Priestly document (which comprises most of Leviticus and Numbers, half of Exodus, and parts of Genesis), was composed in the time of Samuel, Saul, and David; the book of Deuteronomy (D) in the time of Joshua; and the Elohist (E) and Yahwist (J) documents in the time of Moses (that is, they were received by Moses from God). He recognizes the apparent discrepancies in the account of the exodus and gets rid of the difficulty by assuming two "exodi," one in 1447 B. C., described in J E D, the other in 1144, described in P. All the documents, he thinks, are fragmentary and defective, and he prefers the Greek text to the Hebrew.

To discuss all the details of this volume would require another volume of equally formidable size. Professor Toffteen is well acquainted with the Egyptian and cuneiform material, and seems to be embarrassed by its richness—in the dense collection of facts he fails to get the perspective. The search for points of connection between the early Biblical narratives and other ancient records is a fascinating, but sometimes treacherous, pursuit; Winckler was thus beguiled into his astralism, and Toffteen has not entirely escaped the pitfalls of his subject. He has no sense of the differences of spirit and tone in the various parts of the Pentateuch. The elaborate ritualism of the priestly document seems to him to be quite appropriate to the time of David in spite of the crudeness of that period as it is described in the historical books. He has lost sight of the fact of historical development, allows practically nothing for Phœnician, Assyrian, and Babylonian influence on the Israelite cult, and uses the book of Chronicles (a late idealization) as an authority for very early times. He cites many Biblical passages, but does not refer to the decisive statement of Jer. vii, 22, where Jehovah is represented as saying: "I spake not unto your fathers, nor commanded them in the day that I brought them out of the Land of Egypt, concerning holocausts and communal sacrifices," which can only mean that the writer of this passage (about B. C. 604) did not regard the sacrificial ritual as of divine appointment, knew nothing, that is, of the P legislation at Sinai. In regard to the priestly document in general, Professor Toffteen seems not to understand exactly the position of the critics he opposes—he appears sometimes to suppose that they hold this document to have been composed *in toto* in the time of Ezra (fifth century). This, however, is not the case; the view of recent writers is that, while it received its present shape in the fifth century or later, it contains some material belonging to an earlier time; and different strata (P1 P2, etc.) are distinguished.

The author's apologetic aim sometimes leads him into questionable forms of argumentation. The absence of Persia in the P list of Japhetites in Gen. x, 2 has long been noted. A country Parsua appears in Assyrian inscriptions of the ninth century, and Professor Toffteen thence infers that it is improbable that the P document should be much later. But the list in Gen. x is Israelite, not Assyrian, and it is not probable that the Jews knew of the Persians before the advent of Cyrus. Of another people mentioned in this list, Tiras (which Toffteen persists in writing "Tirash"), the ethnological character is confessedly doubtful. This people, says our author, is undoubtedly identical with the Teresh who appear on Egyptian monuments in the twelfth century; and he adds: "We are inclined to identify this Teresh . . . with the Etruscan people of Italy—now, the Etruscan migration into Italy can hardly be placed later than 1100 B. C. . . . At least this portion of the P document must depend upon a written document which is not later in origin, or at least not very much later, than this date." Here, within the space of a short paragraph, with a Biblical name misspelled, an inclination is converted into an historical fact. The contention (p. 23) that P's "polytheism" points to a very early date is not well founded. The term "Elohim" in Gen. i, 26 ("let us make man in our image") is not "used in a polytheistic sense"; Elohim addresses certain subordinate supernatural beings, who are to be identified with "sons of the Elohim" and angels, figures that run through the Old Testament; and the Psalter recognizes the existence of the gods of foreign nations (Ps. xcvi:4 *al*). The refusal to refer the Aaronic priesthood to the postexilic time is nullified by the whole history of the priesthood, which shows a steady differentiation and organization of sacerdotal functions. The assumption of two exodi is a counsel of despair.

Professor Toffteen has brought together many facts of importance; as to his theory, we must agree with him (p. 282) that it "may and probably will have to be modified on future investigation."

Notes.

The issue of Miss M. E. Lowndes's "The Nuns by Port Royal: As Seen in Their Own Narratives," through Henry Frowde, coincides with the bi-centenary of the final suppression of the convent; whose history is touched upon, also, in a biography of Pascal by Viscount St. Cyres, which Smith, Elder & Co. (London) have now in press.

The diary of Ethan Allen Hitchcock, edited by William A. Croffut, Ph.D., is announced for publication by the Putnams. This grandson of the Ethan Allen of Ticonderoga was engaged in our Seminole wars and in the Mexican campaign; during the civil war he was the military adviser of Secretary Stanton and of President Lincoln. His diary is said to contain the most vivid and complete account of our Mexican war ever written and is to be entitled "Fifty Years in Camp and Field."

The first section of Doubleday, Page & Co.'s "Every Child Should Know Encyclopædia," which comprises ten volumes on "Manual Training, or Practical Things Every Child Should Know," will be ready for distribution in 1910, and will be followed by sections of ten volumes on literature, and ten more on nature, science, and art.

Fisher Unwin (London) is issuing in Alfred Perceval Graves's "Irish Fairy Book" a companion volume to Jenkyn Thomas's

"Welsh Fairy Book" of two years ago. Mr. Graves is known as a poet; and here he brings together a rich treasure of fairy-lore. Illustrations by George Denham are one of the promised features.

It is announced that the library of the late Henry Charles Lea of Philadelphia, which is exceptionally rich in unpublished manuscripts, will pass into the possession of the University of Pennsylvania.

William Hamo Thornycroft, R. A., is the sculptor of the statue of Tennyson recently unveiled in the ante-chapel of Trinity College, Cambridge, in this, Tennyson's centenary year. Arthur Sedgwick delivered an oration on the occasion.

In the appointment of the Rev. George Adam Smith, a representative of the Higher Criticism at its best and most distinguished, to the Principalship of Aberdeen University we find a fitting recognition of one eminently fitted for his new position by services as geographer, theologian, and Orientalist.

Sir Arthur Conan Doyle issues, through Hutchinson & Co. (London), "The Crime of the Congo," with a distressing picture and the price of the volume—sixpence—prominently displayed on the jet-black cover.

Lewis Melville's new "Life of Thackeray" is promised for early publication by the John Lane Co. It is said that Mr. Melville has been able to make use of many hitherto unpublished letters.

It is rumored that the Nobel prize for literature will be awarded this year to Anatole France. Former recipients of the prize have been Sully-Prudhomme, Theodor Mommsen, Björnsterne Björnson, Frédéric Mistral, José Echegaray, Henry Sienkiewicz, Giosué Carducci, and Rudyard Kipling. No Russian writer has as yet received this distinction, and no American.

Popular novels at a shilling is the latest experiment of the London publishers. Stanley Paul & Co. announce a full-length novel by Mr. Le Queux ("The Fatal Thirteen"), to be published at that price. It will be interesting to see whether going to the other extreme will prove a successful step in the land of the six-shilling novel, and whether the example set is followed in this country.

Austin Brereton's excellent "Literary History of the Adelphi and Its Neighborhood," first published in 1907, has been reissued in this country by Duffield & Co., with a new introduction. Mr. Brereton divides the Adelphi estate of three acres and a quarter into three parts as follows: houses only, 78,400 sq. ft.; roadways, terrace, and areas, 45,400; foreground, 19,200. It is but a small bit of London, but its associations are peculiarly rich and varied.

We shall soon have a book on "The Quintessence of Nietzsche," by an English writer, J. M. Kennedy, which will be issued through Werner Laurie (London). *En attendant*, a life of the great man has been written by Daniel Halévy, and bears the imprint of Calmann-Lévy. In the nine years which have elapsed since the death of the philosopher, his influence has never ceased to expand. Nietzschelsm is doubtless at the bottom of the contemporary reaction against Socialism. Apart from more general considerations, it seems reasonable to think that the great sympathy expressed for things French by the author of "Ecce homo" is responsible, in its turn, for some measure of the interest and sympathy for the author on the part of the French themselves. In the most recent study of the prophet of the Superman, one finds cited once more his belief that he was of Polish origin: a descendant of the Counts Nietzki. Perhaps this pretension of his played an important rôle in exaggerating his animosity for Teutonic culture. It is likely, too, that his friend, the historian, Burckhardt, was responsible for heightening his animus. Burckhardt, also, loved the Latin genius and the Latin nationalities.

From D. Appleton & Co. we have received a well-printed new edition, with map, of W. J. Gardner's "History of Jamaica," a standard work.

A volume of selections from Michelet's "Histoire de France," annotated by Dr. D. L. Buffum of Princeton, and intended for academic use, is announced for publication by Henry Holt & Co.

Gustave Davois is preparing a bibliography of French works relating to Napoleon which appeared before 1908, which promises to be much fuller than any earlier bibliography of Napoleon, as he has been assisted in his task by members of the Bonaparte family, and by many others.

To celebrate the bicentenary of Samuel Johnson, an exhibition of manuscripts, rare editions, and engravings has been arranged by Professor Tinker of Yale University. First editions of Johnson and Boswell from the Yale Library will be shown, together with interesting Johnsoniana from private libraries in New Haven. The Messrs. Keppel and others will exhibit contemporary engravings from all the known portraits of Johnson; A. E. Newton of Philadelphia has contributed several first editions; J. P. Morgan has lent from his library some Johnson manuscripts; R. B. Adam of Buffalo has sent his manuscripts, autograph letters, and other Johnsoniana. The exhibition will be held in the Yale Library, and will be open to the public daily until November 6.

A privately printed pamphlet, "Lampy's Early Days, By an Old Lampooner" (Cambridge: The Harvard Lampoon Society), is interesting both in text and pictures. Nor need one have been a fellow-editor of Sherwood and Otis, Curtis and the Wheelwrights and Martin, to enjoy its pleasant humor. Presumably the text of the little book is a labor of love; and its illustrations, reproduced from early issues of the paper, were well worth publishing. In its beginnings, the Harvard Charivari bore many resemblances to that partial source of its inspiration, *Punch* of London. As time wore on, the likeness grew dimmer. Meanwhile, the founders of the *Lampoon* had founded *Life*. It seems to us, as we renew our impression of the early issues of this college jester, that they connote a riper humor and a fuller mind than do contemporary numbers. There was, certainly, that greater "collegiate solidarity" of which President Lowell has spoken, to lend them a significance sometimes wanting to-day. The humor of the college papers we see now is almost as stridently "American" as that of the cheaper vehicles of shopworn jokes one finds in barber-shops. But perhaps we are aging. And it may be doubted whether, to-day, the *Lampoon* has the collaboration of Longfellow's successors on the Harvard faculty—there are two of them. That the poet was not above contributing to "Lampy" appears from the inclusion here of his epigram:

> If you have a friend to dine,
> Always give him your best wine;
> If you happen to have two,
> Then the second-best will do.

In the preface to his "Gilbert White and Selborne" (Scribners) Henry C. Shelley speaks of the "Natural History" as "a serious candidate for first honors among English classics." It is true that the work has appeared in innumerable editions—upwards of eighty, to be more precise—but it is a question whether White's grave and elegant letters have been able to maintain any real popularity against the more highly spiced nature books that are now flooding the market. There can be no doubt, however, that his life and writings have furnished Mr. Shelley with material for a pleasant little volume. It may even be said that the record errs rather in brevity than in length. For a charming and easy glimpse into the best aspect of eighteenth-century life we can commend these fluent pages.

The "popular" quality of the price and the binding of the reprinted "Black Dwarf, and A Legend of Montrose," and "The Bride of Lammermoor," which come to us from Henry Frowde, is not achieved at the expense of clearness of type or fairness of paper. That the price is no large one is in itself evidence of the Scottish novels remaining some one's favorite reading—and not specimens of Lamb's *abiblia*, bound expensively in every gentleman's library. One is grateful that the numerous illustrations here are woodcuts rather than the staring photographic reproductions which disfigure so many reëditions of standard novels.

A manual training school on wheels is now being employed in Anson County, N. C., to teach children the use of tools. At eight central points there will be a demonstration on an elevated platform by trained boys and girls as well as teachers. The making of butter-moulds will be exhibited before all the children. In addition all kinds of useful school fixtures and appliances will be exhibited, and in the afternoon and evening there will be some interesting shows, such as glass blowing, wood and metal carving, and moving pictures. The promoter of this novel educational enterprise, John T. Patrick of Wadesboro, offers prizes to all the school-children of the county for the best butter-moulds as well as for excellence in other home and farm industries.

Hugh Black confesses himself an optimist as to American life on the basis of his observations in the many colleges and universities, East and West, where he has served as college preacher, and held intimate conversation on religious themes with large numbers of students. In his introduction to "The Gift of Influence," a volume of university sermons (Fleming H. Revell Co.), he says:

> Superficial observers sometimes speak of the materialism of America. Nothing could be further from the truth, when we look deeply and broadly. It might even be said

with far more truth that America suffers from unregulated idealism. Certainly no one can know intimately the mass of students without being struck by the ready response they give to every high thought and every generous passion. No one can despair of the future who knows the splendid material the colleges of the land contain, and how eagerly men long to attempt great tasks.

The latest issues of the Historical Manuscript Commission of Great Britain are the second report on the manuscripts of the Earl of Egmont, chiefly Irish, and the fifth report on the miscellaneous manuscripts in various collections, in this case chiefly Scottish. The Egmont papers concern in largest part the fortunes of the house of Perceval from the beginning of the reign of Charles II to the end of that of Anne, and refer in the main to the management of the Perceval estates in Ireland. As the Percevals played no conspicuous part either in English or in Irish history their records, except in a few instances, are of local interest only. The most important correspondence, throwing light on contemporary conditions in England and Ireland, is that of Sir Robert Southwell, Whig politician and diplomat, uncle and brother-in-law of Sir John Perceval, the grandfather of the first Earl of Egmont. There are also observations of interest to the student of British history after 1660, but almost none that have any bearing on American history. We learn, indeed, that the Irish merchants were greatly depressed in 1685 by the revival of the act forbidding them to trade directly with the plantations, and we get two or three glimpses of William Blathwayt, auditor-general of the plantation revenues, which bring into somewhat sharper relief his versatile character. But as a whole this report on the Egmont papers is less important than was the first; and the report on the miscellaneous Scottish collections has even less general interest. This last covers the Hay (1300-1736), Edmonstone (1288-1829), and Graham (1200-18th century) manuscripts. The first relates solely to the ancient possessions of the Hay family in Upper Tweeddale and Berwickshire, and is valuable for the history of Scottish tenures. The second, preserved at Duntreath Castle in Strathblane, contains title deeds, official papers, and domestic correspondence, among which are several letters and papers, such as the articles drawn up by the Scottish parliamentary army in 1648 and the declaration of the Presbyterians in arms in 1679. Attention may also be called to a curiously mature letter written in French by Mary, Queen of Scots, at the age of twelve to her mother, the Queen Dowager. The third group, except for a few Jacobite papers and an important letter not hitherto known, from the Episcopal ministers of Scotland to William III, concerns Scotland only.

Some twenty years ago Professor Jacobi published the Prākrit text of a number of Jain stories under the title "Ausgewählte Erzählungen in Mâhârâshtrî." These have been translated by Dr. J. J. Meyer, already well known from his previous rendering of the "Kâvyasangraha," and other Sanskrit works belonging to the classical period. The present text, published by Luzac & Co., London, deserves special mention not only as a faithful version of the original but also as a useful critical commentary on Jacobi's text now partly antiquated. The student of Jain religion will find here new and attractive material, since the tales are above the average of Hindu moral literature, which is apt to leave much to be desired from an æsthetic point of view. As the native proverb has it, "two swords do not go into one scabbard," and generally the Hindu is didactic in his aims even at the cost of beauty.

After a lapse of above thirty years Dr. Claes Annerstedt has published the second part (in two volumes) of his "Upsala Universitets historia" (Upsala: Akademiska bokförlaget), the first part of which was published on the 400th anniversary of the founding of the university, in 1877. The intervening time includes the author's incumbency, for twenty years, of the office of chief librarian of the university, and the publication, in 1894, of a sketch of the history of the university library until 1702, and, in 1893, 1899, and 1905, of four rectorial programmes containing Olof Rudbeck's letters concerning the university from 1661 to 1702, with an introduction. Of the two volumes forming the second part of the history the first narrates the fortunes of the university from 1655 to 1718, while the second describes its organization and activities during the same period. It was a time of almost continuous wars and a well-nigh fantastic patriotism. A large part of the first volume is taken up with Olof Rudbeck, elected rector of the university in 1661, at the age of thirty-one, and with the account of Rudbeck's conflicts with his colleagues, men of smaller stature. Among the other professors at the university we find many who stand in the front rank of Swedish science, such as Rudbeck's colleague in the medical faculty. Peter Hoffvenius; the German Johannes Loccenius and Johannes Schefferus, who both did much to promote the progress of antiquarian and legal studies; Jesper Swedberg, afterwards bishop of Skara, and as such the supervisor of the Swedish congregations in Delaware and Pennsylvania, and others. The theological faculty was preëminent, and every student was obliged to take a preliminary theological course. Its professors had higher salaries than those in the other faculties, and transfers from these to the theological faculty were regarded as a promotion. The theologians demanded and exercised supervision over the opinions and views expressed in the dissertations before the other faculties as well as in the publications of the professors themselves. We see this particularly in the controversies over the Carteslan philosophy which became acute in the 1660s and in the later 1680s. At first introduced by the representatives of natural science, particularly by Petrus Hoffvenius, the system propounded by Descartes eventually spread to the logicians and metaphysicians who hitherto had been bound up in the Aristotelian-scholastic methods. Freedom of thinking was, however, ultimately victorious when Charles XI, in a royal resolution of 1689, declared that "the free use and exercise of philosophy were permitted in order to find and demonstrate the truth with good reasons and experiments, and to promote all lawful sciences."

The Weimar Goethe Society has made a grant of one thousand marks for each of the six volumes now published, and the promise of another thousand on the completion of the seventh and final volume, to the author of "Goethe über seine Dichtungen" (Frankfort-on-the-Main: Rütten & Loening). Certainly this work is one of the most valuable of recent contributions to Goethe literature, yet it has thus far failed to receive, in this country, the recognition due it. This is reflected in the failure of some American editors to mention it in their bibliographies. And yet literary historians long ago established the importance of Goethe's own utterances concerning his writings, and here we have a work which undertakes to collect and arrange systematically his utterances concerning his purely literary writings, including even those lost and those only projected. The action of the Goethe Society now definitely assures the publication of Volume VII, which had been abandoned because the publisher, like Hans Gerhard Gräf, the author, had made to the good cause as great a sacrifice as he felt able under the circumstances to afford.

For convenient reference Gräf has arranged the titles of Goethe's poetical works alphabetically under the three general heads: Epics, Dramas, and Lyrics. The material on the epics fills the first two volumes, that on the dramas the next four (the Faust material alone filling 608 pages of Volume IV), and the seventh volume is to contain all that Goethe had to say of his lyrics. Gräf had the manuscript of Volume VII practically ready for printing when the above-mentioned grant of money was made him, but that appreciation of his labors made him feel that he ought to reciprocate by working over the possible material once more before publishing his results. He expects to have the volume out some time next year. Meanwhile the Weimar edition of Goethe will be completed, except the index to the *Tagebücher*. When this monumental edition is complete Gräf will be able to compile a small supplementary volume to his own work, containing the material not yet published when his earlier volumes were put out. As for his own work, voluminous as it is, its contents are rendered easy of access by means of excellent indexes and tables covering each general division. Another feature that ought to appeal to American scholars is the fact that the author has not given mere refererces to pages in out-of-the-way periodicals and rare books, but has, instead, quoted at length. His text is free from misprints, and in some passages gives the first correct reading of the original; it is accompanied by a sound and suggestive commentary and a statement of his position regarding moot questions, with references to the literature upholding the opposite view. Many a scholar would be justly proud of these volumes as a life work, and yet Gräf has barely reached his prime.

The death of the Swiss moralist and jurist, Charles Hilty, is announced. Born at Grabs, in the Rheinthal, in 1833, he read law in Germany and at Paris, and established himself as a lawyer at Coire (Grissons). Later, he was a professor in his specialty at the University of Berne. He published yearly a political "Jahrbuch," and was a member of the Swiss Legislature. Among his books, expressive of a philosophy at once humanitarian, optimistic, and eva-

gelical, the best known is that entitled "Glück" (Happiness).

From Berlin is reported the death, in his seventieth year, of Lieut.-Col. F. C. Gerhard von Pelet-Narbonne, a well-known writer on military subjects. Among his works are "Hilfsbuch zur Erteilung des theoretischen Unterrichts im Relten" and "Aussichten der Kavallerie im Kampfe gegen die Infanterie und die Artillerie."

Science.

DARWINISM TO-DAY.

Darwin and Modern Science. Cambridge University Press; New York: G. P. Putnam's Sons. $5 net.

Under the auspices of the Cambridge Philosophical Society, arrangements were made for the publication of a volume of essays in commemoration of the centenary of the birth of Charles Darwin and of the fiftieth anniversary of the publication of the "Origin of Species." In response to an invitation to take part in this celebration, some of the most prominent biologists of the world have written on those evolutionary topics with which they are most familiar. Among the contributors are found not only leading champions of Darwin's teachings—*e. g.*, Haeckel, Weismann, Poulton, Lloyd Morgan—but others who have opened lines of investigation that have thrown a flood of light on problems only incidentally touched on by Darwin, notably such naturalists as De Vries, Bateson, W. B. Scott, and Klebs. Still other writers, who can scarcely be ranked as Darwinians, in the most generous extension of that term, have given voluntary testimony to the broadening influence of Darwin's thought and method. All offer their tribute to a great naturalist. One name alone is conspicuously absent, that of Alfred Wallace.

It is not without significance that Great Britain supplies seventeen of the twenty-nine contributors (ten from Cambridge alone), Germany six, the United States two, France, Holland, and Norway one each—significant as an indication of the place of Darwinism in modern thought. It is sometimes said that Darwinism has become an English asset, and, whether the statement be true or not, certainly in England Darwin has had his greatest following. Germany, too, has felt his influence deeply, and while other countries have also come under the spell, his teaching has never had the same paramount importance as in England and Germany. The absence of contributors from many countries is no less anomalous than the excess from Great Britain.

The present volume is addressed primarily to that nondescript person, the "educated layman," rather than to the specialist, and undoubtedly the chief value of the essays is for that class for whom they are designed; but the expert also will find much to entertain him and something for his instruction. The choice of topics covers almost the whole range of intellectual interests: descent, natural selection, heredity, psychology, history, religion, language, double stars, and the evolution of matter. While it is true that the revival of interest in the whole philosophy of evolution was directly the outcome of Darwin's writings, it is unfortunate that the distinction between the evolution of living things (organic evolution) and the conception of evolution applied to other spheres is so often disregarded. The laudable effort of these essays to show the far-reaching influence of evolutionary thought may lead still further to obscure this fundamental distinction. Organic evolution is based on the recognized processes of variation, heredity, and survival, which take place through a chain of living beings, each starting with the egg. The application of the idea of evolution to religion, language, double stars, and matter ignores the fact that we are here dealing with an entirely different process.

Any attempt to summarize or to criticise the twenty-nine essays that cover collectively nearly 600 pages, is out of the question. No finer tribute to Darwin's personality has been offered than that of Höffding in his essay on "The Influence of the Conception of Evolution on Modern Philosophy":

> His deep love of truth, his indefatigable inquiry, his wide horizon, and his steady self-criticism make him a scientific model, even if his results and theories should eventually come to possess mainly an historic interest. In the intellectual domain the primary object is to reach high summits from which wide surveys are possible, to reach them toiling honestly upwards by the way of experience, and then not to turn dizzy when a summit is gained. Darwinians have sometimes turned dizzy, but Darwin never.

No less significant is the statement that, while Darwin foresaw that his doctrines would occasion "a whole of metaphysics," he himself was reserved before ultimate questions, and his answers to such questions were extorted from him.

Concerning Darwin's special theory of natural selection or the survival of the fittest, these essays have a good deal to say, but they speak very diversely, and the complete ignoring of this theory in several essays is no less marked than its laudation in others. One of Darwin's most formidable opponents, Samuel Butler, admits that "to the end of time if the question be asked, 'Who taught people to believe in evolution,' the answer must be that it was Mr. Darwin." And a more modern expert on the theory of heredity does not hesitate to write:

> Not for a few generations, but through all ages, he should be remembered as the first who showed clearly that the problems of heredity and variation are soluble by observation and laid down the course by which we must proceed to their solution.

After all has been said, Darwin's own estimate hits the mark more nearly than that of either his followers or his opponents:

> Hence if I have erred in giving to natural selection great power, which I am very far from admitting, or in having exaggerated its power, which is in itself probable, I have at least, as I hope, done good service in aiding to overthrow the dogma of separate creations.

Historically, Darwin's influence lies exactly here, as he himself surmised; for, whether we accept or deny the efficiency of natural selection to account for the process of evolution, it is a fact that, after 1859, the prevailing theory of special creations died a quick and painful death.

As an expression of modern thought concerning evolution and its tributary studies of heredity and variation no more admirable compilation than these essays has appeared in recent times. We are once more at the turning point; the old is giving place rapidly to the new, and here, perhaps for the last time, the older writers of the earlier Darwinism meet the newer contributors to advancing thought in friendly discourse.

In Prof. Charles L. Poor's "Nautical Science," promised by the Putnams, we look for an account, in language intelligible to the layman, of the astronomical facts and the scientific principles upon which navigation is based. This book will contain a description of the tides and tidal currents, and the most valuable results of researches by our Coast and Geodetic Survey.

Henry Holt & Co. announce for autumn publication two works of physiology entitled, respectively: "Physiology of Man and Other Animals," by Anne Moore, and "The History of the Human Body," by Prof. H. H. Wilder. The former book is an elementary treatment of pure physiology; the latter, intended for advanced students, is a study of technical human anatomy.

On November 11 and 12 will be held in Lampson Hall, Yale University, a conference on the prevention of infant mortality; this being the third mid-year meeting of the American Academy of Medicine. The exhibits by the Boston committee on milk and baby hygiene, and other organizations, are under the supervision of Professor Fisher. Four sessions will be held, at which more than twenty papers will be read by members of the conference.

Drama.

Das Drama: Wesen, Theorie, und Technik des Dramas. Von Dr. Hermann Schlag. New York: Imported by G. E. Stechert & Co.

Few Germans have had the years' ex-

perience of the well-known Weimar professor in the editing and preparation of plays for the Continental stage, and it is not surprising that his latest volume, summing up the impressions of a life in which the theatre has passed through several evolutions, should prove the most notable book of its kind since the publication of Gustav Freytag's "Technik des Dramas." Very likely it surpasses, in some respects at least, Freytag's epoch-making work, for whereas Freytag confined himself chiefly to tragedy and the outward construction of a play, Schlag in his compact pages —containing scarcely less than 160,000 words—has sought to cover the entire field of the playwright, and much more satisfactorily than either Hessen or Nossig has done. Writing from his own observation and experience, Schlag avoids the too scientific bias of Weitbrecht, on the one hand, and the Emersonian disorder of Bulthaupt in his four huge volumes, on the other. Apparently, too, he has escaped the mistakes marring Harlan's new "Schule des Lustspiels." Like Bulthaupt, however, Schlag chiefly occupies himself, so far as the foreign stage is concerned, with Shakespeare and Ibsen. These dramatists apart, Shaw alone seems to challenge Schlag's attention; nor does Shaw fare very well at his hands. Herr Schlag admits the talent shown here and there by the "phosphorescent Irishman," but considers that Shaw soon wearies his audience, and holds him, in one stage-direction at least, "absolutely daft"—*ganz verrückt!*

Schlag is one of those who look back, with Goethe, to the good old times "when one could, without trouble, always pick up a repertory from among the plays at hand and lying about loose." He finds the sources of dramatic art-theory chiefly in Aristotle and Lessing, and outlines, in some twenty-eight chapters, the five fundamental laws of dramatic composition. These, according to Schlag, have still to do with *die Handlung, die Charaktere das Verstandesmässige, die Sprache*, and *die Anpassung an die Bühne.*

Two quite practical chapters on the dramatic materials, dramatic methods, the relations of the playwright to his public, and the qualities which the poet must possess in order to become a successful dramatist close, with a good bibliography, this excellent volume.

It is natural that the author of a work of this order should again and again refer to "the modern." Professor Schlag sees in Hauptmann (referred to both as Gerhart and Gerhard) a poet deserving of far more consideration than the rest of contemporary stage aspirants. The praise is not unqualified, however: for he regards Hauptmann as having striven to extricate himself from the naturalistic morass, but as having only partially succeeded, and as having failed, thus far, to fulfil the promise of his early work. In Sudermann, Schlag sees not a poet, but a fruitful stage-craftsman, who is a good delineator of character and an able word-painter, but who has not begun to do with his precious talents what the world has a right to expect of him. Hauptmann has failed to climb; Sudermann has positively sunk, year by year, deeper and deeper into the mire of the commonplace and the disgusting. According to our critic, the saviour of the modern stage has, however, appeared in Wildenbruch, who, although he, too, passed through the humiliation of repeated failures following early success, at last, and shortly before his death, gave to the German theatre his *Die Rabensteinerin.* From this single achievement of Wildenbruch's, one may see that art remains art, and that it matters little whether the poet, when he comes, be romantic or classic, prosaic or prosodic, realistic or idealistic: if only he appears as a true dramatist, he will come into his own. For the future of the dramatic art, this writer is in the highest degree sanguine.

The latest play by Alfred Sutro, "The Builder of Bridges," which is now to be seen in the Hudson Theatre, shows the author's technical skill and instinctive sense of theatrical situation, but is purely commercial, not serious, drama. Although it is smartly written, in places, and contains more than one clever character sketch, it is so insincere in sentiment, and so conventional, as well as so unlikely in action, that it has no value as a reflection of actual life. The heroine, after trading disgracefully on the emotions of two honorable men—to both of whom she engages herself—in order to raise money to settle a thieving brother's defalcation, is finally pardoned by the lover who has been most egregiously deceived, on the ground that she erred simply through sisterly affection. The piece is immoral because of the gloss put upon bad and treacherous actions, and has no special literary or dramatic quality to offer in justification. Whatever success it may have will be due chiefly to the artistic acting of Kyrle Bellew as the complacent hero.

The play Roy Horniman founded upon the main incidents of W. J. Locke's novel, "Idols," which was produced with some success in London, was presented in the Bijou Theatre here on Monday evening. Like the great majority of similar adaptations, it contains but little of the charm, power, or illusion of the original book. In its bare outlines, the tale becomes crude and unsympathetic melodrama. The purely theatrical and unreasonable nature of the plot is clearly revealed. The court episode itself, the main object of the dramatization, is seen, upon the least reflection, to be based upon inadmissible premises. If it be granted that a respectable and happily married woman might, in open court, in a fit of emotional ecstasy, falsely declare herself an adulteress, in order to prove an alibi for an innocent man to whom she owed a great debt of gratitude, and whose lips hitherto had been sealed by his honorable obligations to another woman, it is utterly inconceivable that a brave and gallant man—such as the beneficiary is described to be—could allow himself to profit by such a sacrifice, even for an instant, when a revelation of the simple truth would save him and hurt nobody. There are other equally glaring improbabilities in a scene which has no real dramatic value other than its alleged realism. The acting at the Bijou is not of first rate quality by any means, but the merely sensational value of the murder and trial scenes may keep the piece alive for a season. The representation is something entirely apart from the book, in spirit and value.

At the MacDowell Club, in New York city, Josephine Preston Peabody will read, on November 15, her new play, "The Piper," which is a re-creation of the Hamelin personage. This play, the first by Miss Peabody to be published since "Marlowe," is to be issued through Houghton Mifflin Co.

David Belasco has three new productions in course of preparation. One is a political play, by William C. De Mille, entitled "The Machine"; another is a play in which Charlotte Walker is to be the star, and of the third he claims the authorship himself, while confessing his obligations to the French. For this production he promises a cast of the rarest excellence, to be secured by some process which the press agent describes as a combination of all the best that there is in the old stock company and the present star system.

The latest historical character to be sacrificed on the altar of costume-melodrama is Sir Walter Raleigh, who is made the hero of a "Romantic Play" at the Lyric Theatre (London) by William Devereux The gallant soldier, sea-captain, poet, statesman, and historian emerges here an inferior swashbuckler of the type of *cap et d'épée.* No one profits by all this but Mr. Lewis Waller, of picturesque pose and lively eloquence.

The tercentenary of Shakespeare's death will fall on April 23, 1916, and with a view to its commemoration, it is proposed by the special committee for the erection of a National Shakespeare Theatre in London to raise by subscription a fund of £500,000, so that the theatre may be an accomplished fact by that date. The committee declares that only thus will be removed from London "the unenviable distinction of being perhaps the only great capital in Europe which does not possess such an institution."

Wedekind's "The Awakening of Spring: A Tragedy of Childhood," Englished by Francis J. Ziegler, is to be issued this month through Brown Bros., Philadelphia. The drama's thesis is that "it is a fatal error to bring up children, either boys or girls, in ignorance of their sexual nature" (we quote Mr. Ziegler's "Poem for Prudes"). "Frühling's Erwachen" has gone through twenty-six editions in its original language, and has been translated into Russian and French. The play has been successfully produced in Germany, but proved a failure on the Paris stage. There can, of course, be no question of its American production.

Victorien Sardou was, from 1864 until the time of his death, a resident of Marly-

le-Roi, and that village has now honored the dramatist with a bust. Sardou always interested himself in the affairs of the little community of which he was the most distinguished citizen, and even served, in 1870, as its Mayor. The dedication of the bust brought together a distinguished gathering; from Paris came members of the playwright's family, MM. Hervieu, Richepin, de Croisset, Bernstein, etc., and the widow of Dumas, *fils*. Among the speakers were René Millet, *conseiller général*, and M. de Nolhac, curator of the Museum of Versailles.

At this moment, two plays by M. Brieux hold the Paris stage. At the Français is seen "La Robe rouge," the play which has for its theme the abuses of the French magisterial procedure, first enacted upon the stage of the Vaudeville, in 1900. One may fairly call this the dramatist's masterpiece, and at the Maison de Molière it has renewed its youth. M. Brieux's new piece, "Suzette," is to be seen at the theatre where his earlier play was first produced. It is doubtful whether this drama of outraged motherhood (it suggests, too, at moments, the central situation of Mr. Pinero's "His House in Order") has attained much more than a *succès d'estime*. Its excellent passages do not close the eyes of the spectator to the fact that it has, in high degree, the usual defect of the plays of this capable dramatist: it contains almost too many *petites conférences*. Brieux's "La Foi," elaborately staged this autumn at His Majesty's Theatre, in London, and called, in translation, "False Gods," was blamed by London critics, it will be remembered, for this same excess of intellectuality, not to say dulness. "Suzette" deals, it should be said, with the rupture of the spouses Chambert, and the separation of the sinning mother, who retains the public's good wishes, from the child whom she loves, and who gives the play its title. In the judicial separation, the mother is accorded the privilege of seeing her child once each month, but the difficulties thrown in the way of their meetings, and the conduct of the father and his contemptible family, who seek in every way to poison the child against her mother, are, of course, a terrible experience for Suzette, and the mother in the end gives way: this that the child's breast may no longer be torn by a conflict so ruinous to her proper development. It is, in itself, an unpleasant performance; and one cannot congratulate M. Brieux upon having created characters which command our admiration as theatric personages. Neither is our sympathy sufficiently kindled, even for the unfortunate mother herself.

Music.

The rivalry between the two opera companies in this city, which has reached an acute stage, has caused both of them to announce the attractions of the opening week longer in advance than usual. Mr. Hammerstein, who begins next Monday, has even taken the public into his confidence regarding the many offerings of the first two weeks at the Manhattan. Among these will be two novelties, two French operas never before sung in this city, both by Massenet, for whose works Mr. Hammerstein has had a deep affection ever since he secured Maurice Renaud and Mary Garden. "Hérodiade" is to be produced, in the newer version, on November 8, the first night of the season, and "Sapho" is to have its première on November 17. Among the other operas of the first two weeks are "Traviata," "Lucia" and "The Daughter of the Regiment" (for Tetrazzini), and "Aïda." The Opéra Comique branch of this house is to open the following week with "La Fille de Madame Angot" on November 16, and "La Mascotte" on the twentieth.

The Metropolitan does not open till November 15, and it has no novelty to offer in the way of operas during the first week; but there is to be a revival of "Lohengrin" that will eclipse even the glories of "Parsifal," while "La Gioconda" and "Otello" are to enjoy the advantage of new singers and fresh scenic attire. "La Traviata," "Madama Butterfly," and "La Bohème" will also be heard during the first week. But the Metropolitan Opera Company's most notable achievement will be the annexation of the New Theatre, which is to be musically dedicated on the evening of November 16 by a performance of Massenet's "Werther," to be followed the next afternoon by Smetana's "The Bartered Bride."

Mme. Sembrich will be heard in her annual recital in Carnegie Hall on Tuesday afternoon, November 9.

Dr. Alfred Christian Kalischer, the editor of the recently issued "Beethovens Sämtliche Briefe," has died at Berlin. Among his other publications we may note editions of Wegeler and Ries's "Beethoven," Anton Schindler's "Beethovens Biographie," and Lenz's "Beethoven." His "Beethovens Frauenkreis" was issued on the very day of his death (October 6).

From Dresden we learn of the death, at the age of sixty-five years, of one of the most celebrated Wagnerian tenors of the last generation, Heinrich Gudehus, long an interpreter of the part of Parsifal at Bayreuth. Gudehus belonged, for many years, to the Royal Operas of Dresden and of Berlin.

Art.

THE WATER-COLOR EXHIBITION.

Of the 363 paintings now exhibited at the Fine Arts building by the New York Water-Color Club only a few are water-colors in the stricter sense. Oils are naturally excluded, but pastel, gouache, tempera, and mixtures of all the slighter mediums hang together in confusing juxtaposition. Similarly, fully conducted pictures tend to efface the more summary sketches. With the vigorous works of C. W. Eaton, Gruppe, and C. C. Cooper prominently displayed (painting in the full gamut), how is one to catch the evasively exquisite quality of H. M. Camp's twilights, of Louis Tiffany's California Squash Field, of F. M. Marsh's two-skied drawings, of Jane Peterson's city nooks in the Old World? In short, this is neither a water-color exhibition nor for that matter an exhibition of any sort. It is merely a casual collection of disparate matter, with a fair number of interesting items.

This is no fault of the New York Water Color Club or of its hanging committee. They have done their best with galleries unfitted for the purpose. Some day there will be a series of low galleries in light tones, in which finished paintings, sketches, and even the slightest notes may find congenial quarters. Until the time when the art societies possess a suitable building, the minor shows must continue to have a makeshift character. Meanwhile let us forget a diffused discomfort and enjoy the particular goods the jury has provided.

The stately talent of Charles Warren Eaton appears to rare advantage in a series of nocturnes, mostly on Lake Como. He has carried a simplification very far without falling into emptiness, and without undue formality he displays a thoughtful sense of arrangement. The tone of these pastels is often exquisite, though the uniform employment of blue and gray sometimes approaches mannerism. Alexander Robinson's African and Venetian scenes are crisp in drawing, sonorous in color, vivacious in general effect. Their execution gives a fillip, but is there much behind all this bravura? For that desirable something behind, turn to C. C. Cooper's Columbus Circle. Out of a confusing and complicated appearance he has wrought a unified vision. The restlessness and motion of New York at full current here settle into something that is at least exalted prose and perhaps poetry. These three men and Gruppe, whose sterling talent needs no new comment, are, as has been hinted, hard and possibly unfair company for the run of the exhibitors. In a better world, the pampered pastellist and the practitioner in tempera will be forced to choose between the oil shows and those in water-color, or, better yet, will be hung according to the completeness or suggestiveness of the execution. As it is, the happy adept of tempera and pastel may joyously conduct a continuous exhibitionistic performance.

The present writer grudges no painter his favorite materials, but confesses to a liking for water colors that do not keep him guessing. There is an authentic, if limited, charm in the pure color boldly applied that no other medium shares. It is refreshing to find men who still can do something expressive with the edges of the wash. John J. Redmond's Sunset Glow in the Alps, Charles H. Wright's The Jungfrau, or the pasturing cattle of F. D. Marsh, Mrs. Nicholls's Laundry Maid in a garden, and Hilda Belcher's two portraits of girls, one of which receives the Beal prize, reveal a similar spontaneity. Ernest D. Roth's little Venetian sketch, and Harold Camp's delicious twilights, par-

ticularly his November, with its pellucid evening sky and wind-blown shrubs, again satisfy greatly an old-fashioned lover of simple ways of seeing and doing. Frank J. Mulhaupt's Meadow and Hillside is lovely for the discreet contrast of a pale green tree set against distant russet groves, and is rarely impressive for the simplicity of the main planes and the large scale of the whole. It combines in unusual fashion a delicate realism with decorative quality.

To particularize the pictures that stand out for one reason or another is neither possible nor desirable. Popularity may be predicted for Edward Dufner's Moonlit Lake, which holds a place of honor. To many it will seem oversweet. Walter Palmer's able and somewhat arid snow studies lend themselves to no fresh comment. E. Luis Mora's Spanish scenes occupy an entire end wall of the second gallery. They have a Pasini-like brilliancy. It is difficult to to see anything amiss with them, or anything personal and interesting. Take the Gorge of Ronda (No. 311). Was ever tremendous romantic scenery more placidly painted? It is a dandified Spain that Mr. Mora gives us. There is no thrill in it. Among the figure studies, nothing is more interesting than Jerome Meyer's sombre and trenchant studies of East Side children.

The beginning is also the ending. When will the art societies have galleries in which sketches, black and white, etc., may be shown as favorably as they now are at the dealers'?

The exhibition is open until November 21.

At Keppell's is being shown until November 6 a group of drawings by old masters, mostly Dutch and Flemish. A composition sketch by Rembrandt for a Beheading of John the Baptist is, perhaps, the most notable exhibit. It is a studio note, and without charm, but carried through with a stalwart economy that makes it a model of swift and masterful execution. Few but artists will read the merit of it fully. Rembrandt in a more conventional vein is represented by a sketch of a couchant lion. Ruysdael, Craesbeeck, Adrian van Ostade, Bakhuisen, and Maas are shown in characteristic examples. The little group of washed drawings by Van Goyen deserve a more specific attention, while a sketch of a village school by Isack van Ostade is a little marvel of animation and gusto. We comment elsewhere in this issue on the sketches by the great Claude exhibited. Brosmaer, Pencz, and Canaletto are also represented.

The following exhibitions will be held this season in the galleries of the Salmagundi Club: Work by the late C. Myles Collier, opening November 8; work by Carl Rungius, November 22; annual illustration show, ecember 3; annual water color show, December 17; work by C. A. Needham, January 18.

The Metropolitan Museum has issued the illustrated catalogue in two volumes of its art exhibition, held in connection with the Hudson-Fulton celebration. They are handsome volumes, profusely illustrated with excellent reproductions. The first volume, which is dedicated to the paintings by Dutch masters of the seventeenth century, contains a reproduction of every picture exhibited except a Pieter de Hooch—a woman at a washtub in a yard with another woman drawing water from a well—which J. Pierpont Morgan recently purchased in this city, and which was lent to the collection after the catalogue had gone to press. The second volume deals with the exhibition of American paintings, furniture, etc. It contains an article by Miss Florence Levy, giving a lucid description of old American silver, the rich collection of which, at the Metropolitan, has been a revelation to the public. The price of the two volumes, which are not sold separately, is $5.

Washington Irving died on November 28, 1859, and the anniversary of his death is noted by the New York Public Library in an exhibition of his works, and of various prints, in the lower hall of the Lenox Library building.

The twentieth annual exhibition of the Art Club of Philadelphia will continue until December 5. One hundred and seven paintings, the work of eighty-eight exhibitors, are shown. Frank W. Benson, Elliott Daingerfield, Birge Harrison, Childe Hassam, Philip Hale, W. E. Schofield, Willard Metcalfe, and Edmund C. Tarbell are among the painters sending canvases. Robert Henri's The Blue Kimona has been awarded the club's gold medal. Honorable mention has been given to Daniel Garber for his In Winter—Richmond. Whistler is represented by his Study in Rose and Brown.

"Artists, Past and Present" (Moffat, Yard & Co.) contains a dozen "random studies" by Elisabeth Luther Cary of artists from Crevelli to Carl Larsson and Zuloaga. Miss Cary has the qualifications of intelligence, flexibility, sympathy, and a pretty, flowing style, and these are so many more than are often thought sufficient for the practice of art criticism that her book is distinctly above the average. What she lacks is a natural or trained insight into technical matters, which are, after all, the important matters in art, so that she seems seldom to be talking of the real thing. What she sees is not the work of art, as an artist recognizes it, but something else—something with intellectual and moral qualities, but not made of lines or surfaces of paint. And while you may learn to know a man in many ways you will never know the artist until you understand the quality of his lines and his surfaces.

Dr. Luigi Pernier is to be the first director of the Archæological Institute newly established at Athens by the Italian government.

Announcement is made of the death of Hippolyte Dubois, director of the Algerian Ecole des Beaux-Arts. A pupil of Gleyse, his prominence as a painter dates from 1873, when he obtained the gold medal of the Salon.

Dr. A. Bredius, who has held, since 1889, the directorship of the Royal Museum at The Hague, is succeeded by Dr. W. Martin. In 1895, it will be remembered, Dr. Bredius published, with the assistance of Dr. Hofstede de Groot, an elaborate *catalogue raisonné* of the works of art of the Mauritshuis.

William Powell Frith, R.A., died at London, November 2, in his ninety-first year. He was in his time the most popular of British painters, and some day several of his pictures, such as Derby Day, Life at the Seaside, and The Railway Station, will be valued as faithful and excellently drawn representations of mid-Victorian life. Probably he received in his heyday higher prices than any contemporary painter. For The Railway Station he received $45,000, and the painting was resold for $80,000, with a subscription list to the engraving, so well known in this country. For his Marriage of the Prince of Wales (the present King), which was exhibited at the Philadelphia Centennial Exposition, he was paid $40,000. The painter was on intimate terms with the London celebrities of his period, and in his "Autobiography" and "Further Reminiscences" has left a charming record of his friendships and impressions.

Finance.

THE "STEEL DIVIDEND."

Directors of the United States Steel Corporation last week raised the quarterly dividend on the common stock to the rate which was paid in the first two years of the company's history. When the so-called billion-dollar steel combination" was organized and incorporated, early in 1901, animated discussion began at once in Wall Street as to whether dividends would forthwith be paid on the $500,000,000 common stock. The consensus of conservative opinion was that such action, at so experimental a stage in the company's affairs, would be unwise. It happened, however, that "Steel common" had been issued in exchange for the common stock of nine other existing combinations in the steel trade. Of these nine corporations, four had previously been paying dividends on their own common stock and five had not; and it is quite conceivable that, in the course of the merger negotiations, some at least of the companies of which control was sought had been promised dividends on the new combination's common shares.

However this may be, the initial controversy was quickly settled by the paying of a 4 per cent. annual dividend on the stock. The results were not altogether fortunate. Two years later came a decided reaction in the steel trade; net earnings of the Steel Corporation fell for a time to barely one-third their previous quarterly average, and the dividend on the common stock was for two years entirely suspended.

When, in the opening months of 1906, prosperity returned to the industry, dividends were resumed, but this time in an extremely cautious way. Only 2 per cent. was now paid annually on the common shares, and, even in periods of unprecedentedly large earnings, the management pursued the far-sighted

policy of making heavy appropriations from the annual earnings, not only for depreciation account but for the necessary new construction. The result of this wise plan was that the next severe trade reaction found the company in a strong position. The panic shock of 1907 cut its earnings so low that, in order to pay the next quarter's dividend, construction and replacement expenditures, which had been $15,000,000 in the same three months of the year before, had to be entirely suspended; but the accumulated surplus was regarded as a sufficient safeguard to permit continuance of that dividend. It was paid at an unchanged rate thoughout 1907 and up to the middle of the present year.

With the reduction in the price of steel early this year, and the consequent rapid revival in the trade, earnings of the company increased steadily, though they did not attain the heights of 1906 and 1907. In the quarter ending last June, net earnings were greatly in excess of the year before; but they were still smaller than in any other previous year save one; they were barely 64 per cent. of the same quarter's earnings during the active trade of 1907, and the management had not seen its way to resume the special appropriations for construction, suspended since the panic of 1907. It was on that occasion, nevertheless, that the directors decided on an increase in the common stock dividend to an annual rate of 3 per cent.

It cannot be denied that, in raising a dividend before earnings had fully recovered from the setback of 1907, the directors did not follow the lines marked out and observed in the experience of cautious railway corporations. In many minds, however, the higher dividend of last July found legitimate defence in the continued improvement of the steel trade. But instead of merely contending that this improvement warranted the 3 per cent. rate, a still higher dividend was at once predicted. Rumors of a return to a 4 per cent. annual rate at the October meeting circulated persistently in Wall Street, and last week the rumors were confirmed.

Earnings reported for the September quarter showed a large increase over those of the three months ending with June, and they reflected a highly encouraging situation. But they failed by 10 per cent. or more to reach the magnitude of two or three quarterly periods during 1906 and 1907, when the annual dividend was 2 per cent. They exceeded by only a million and a half the net earnings of the corresponding quarter in 1902, when the corporation's scope of business was much smaller and when it reported fixed charges less by $6,000,000 than in the quarter past. It is in the light of these facts, as well as in the light of the past quarter's large increase in earnings, that the company's dividend policy must be judged.

The answer made from the Stock Exchange to all such qualifying considerations is, that the Steel Corporation may not be making the most brilliant of all exhibits now, but will soon be doing so. It is not necessary to question or throw doubt on such predictions; every one hopes that they will be fulfilled. But it is well, especially in the midst of a violently excited market for the stock of the company concerned, to remember that predictions are predictions, and that the misfortunes of investors and speculators ordinarily arise from mistaking expectations for certainties. The history of the Steel Corporation itself, as this brief review has shown, has not been wholly free from occasional misjudgments of the sort, and the extent to which the "Steel shares" seem to have appealed to the plain and uninformed investor gives reason for some cautionary words at a time when extravagant inferences may be drawn from last week's action on the dividend.

Jane Grey Perkins's Life of the Honorable Mrs. Norton

With hitherto unpublished letters. Illustrated. 8vo, $3.50 net; by mail, $3.72.

Mrs. Norton was the great Sheridan's granddaughter; the author of novels, poems and songs, contesting contemporary popularity with Mrs. Browning; her influence was potent in politics; Meredith undoubtedly had her in mind when he drew "Diana."

W. R. Hereford's The Demagog

A novel of to-day.

The main figure, the owner of a chain of great daily newspapers, aspires to the Presidency. In a vigorous campaign his chief opponent is an eloquent and forceful District Attorney.

The love interest is absorbing.

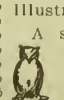
As a story this has the strength of plot, the clearly drawn characters, the varied incidents that insure wide popularity.

The author is a newspaper man of wide experience. ($1.50.)

Alice C. Haines's Cock-a-doo-dle Hill

A sequel to "The Luck of the Dudley Grahams," now in its 4th printing. Illustrated, $1.50.

A story of home life on a poultry farm that will appeal particularly to girls from 9 to 16 years old.



Henry Holt & Co. 34 W. 33d St. New York

MAGAZINES (including THE NATION) bought by A. S. CLARK, Peekskill, N. Y.

The Nation.

NEW YORK, THURSDAY, NOVEMBER 11, 1909.

The Week.

Senator Cummins of Iowa invaded Illinois on Saturday to utter his flat defiance of Speaker Cannon and all the let-us-alone tariff lotus-eaters. The speech was significant because it expressed the thoughts of many hearts in the West. This was the chief point that Senator Cummins made. He spoke as but the representative of thousands of Republicans who are bitterly disappointed with the Payne-Aldrich bill, and are determined to work and vote for its speedy amendment. If these people are to be "read out of the party," with them will go the Republican majorities in many of the States, from Ohio to the Rocky Mountains. But the men for whom the Iowa Senator speaks do not propose to be read out. They are going to keep up the good fight which they made in Washington last spring. In particular, as Senator Cummins intimates, they intend to strengthen and make use of the Tariff Commission in every way possible. A hasty remark of President Taft's was taken to mean that the Commission would do nothing for the next four years except compile information and produce a "glossary." But the President's original statement should not be forgotten, in which he plainly said that the inquiries of the Commission might be expected to be made the basis of "executive recommendations" to Congress.

Not so alarming as the bad Republican slump in Massachusetts, but perhaps as disappointing to a certain gentleman who has been sailing down the Mississippi River and making love to the people of the South, is the Republican showing in Virginia. The Democrats have elected their Governor by a majority of 23,000 and probably kept their majority of one hundred in the Legislature in joint session. Such comfort as exists for Mr. Taft is found in a reduction of 15,000 votes in the Democratic majority of four years ago. He probably hoped for better things. He had made excellent Federal appointments in the State; Postmaster-General Hitchcock had not been idle; the liking between the President and the people of the State was mutual. But even in the romantic Southland, sentiment and business are two different things. The line that bounds the solid South will take a good deal of scouring before it disappears. That it must fade in the course of time follows not only from the ardent courtship of Republican Presidents but from events within the South itself. When Southern manufacturers shall have completely gone over to the game of Protection grab, when Southern Senators shall have all awakened to the fact that if there is any stealing going on they are entitled to their share of it, there will be no reason left why the South should not go Republican.

On the Saturday before election, Senator Lodge made a speech in Boston which was evidently intended to check the Republican defection in Massachusetts, but which in effect could only have intensified it. For it was all about the tariff. After denying that the tariff question had anything to do with the State campaign, and affirming that the Democrats were "chattering" about it simply because they could not attack "Gov. Draper's admirable Administration," the Senator indulged in a couple of columns of tariff chatter of his own. The drift of it was that the recent tariff revision was a masterpiece of statesmanship; that its many grave defects were due to the fact that "we could not do what we wanted"; and that there may soon be another revision by which the tariff will be "still further improved." Mr. Lodge observed in a detached and far-away manner that "an especial attack has been made on the wool schedule." Not a word as to the chief attacker, namely, President Taft himself! Even the Senator had to admit that iniquities were wrapped in Mr. Whitman's wool, but still he contended that "on the whole, the interests of Massachusetts have been well guarded." His audience was gravely assured that Senator Crane and he in all that they did "thought first and always of the half-million people who work in the Massachusetts industries." Before the reader exhausts his powers of laughter over this, let him save something for the Senator's economic discovery that Cleveland's tariff message of 1887 was the "principal cause of the panic of 1893"!

There was a time when it would have been well to have included in the oaths of Southern Governors a special obligation to oppose and defeat lynching mobs. But the necessity for this appears to have passed by. Even Gov. Vardaman, victim of negrophobia that he was, balked more than one mob, and nearly every one of the present Governors has taken more or less vigorous action against those who would violate the laws in the name of order. Last week it was Gov. Glasscock of West Virginia who earned the gratitude of his State, and of law-abiding people everywhere, by taking from the jail in Gassaway two negroes, who were accused of assault and in danger of lynching. Gov. Glasscock marched with the militia and the prisoners, directed the strategy which outwitted the 200 armed men lying in wait, and saw that the prisoners were taken to another town where the militia will continue to guard them, until all danger is over. This is the kind of distinguished active service which ought to insure to Gov. Glasscock a long political career. In no other direction can he serve his State as well.

The commendable habit of giving money to colleges to be used as the colleges think best is growing. Libraries, dormitories, and stadia impress the popular imagination and gratify the vanity of the donor, but many a university president has had reason to fear the benefactor bearing gifts in the shape of a new building that has to be kept up and furnished with classes and instructors. Additions to their general endowment funds the colleges have been pleading for, and these they are now beginning to get. An unrestricted donation, like the two and a quarter million dollars which Columbia University receives under the will of the late John Stewart Kennedy, the New York broker, may be made to mean almost as much in the true evolution of a university as can a ten-million-dollar campus and a set of fine new buildings. It means an increase in the number and efficiency of the teaching staff. Courses given by under-

paid and overworked young instructors can now afford better-trained men and men less harassed with the vulgar worries of bread and rent. Courses that are needed, and not given because of the millions that go for interest charges and athletic fields, may now receive some attention. The teaching staff must always be the prime care of the college administrator. Buildings can wait, but a half-starved Ph.D. will sooner or later desert the academic halls for a place in the wholesale starch or dress-goods business. From the famous log with a student at one end and Mark Hopkins at the other we have changed to marble halls with a tired instructor at one end and a bored class at the other.

It is a relief to be told that the rumors of a Martian catastrophe, involving the destruction of all life upon that planet, are false. To have that bright young life snuffed out just when eyes on earth have discovered it would have been the saddest event in the whole range of cosmic history. Better that life had never come into being beyond terrestrial bounds, if it really has come, than that it should disappear just when we are about to question it. Better that the Martian canals had never been built, if there are such canals; better that the Martian vegetation had perished ten thousand years ago, if those dark patches are really forests; better that the polar ice-cap on Mars—taking it for granted that the ice-cap is actually there—had drawn tight over the entire rotundity of the planet, than to have the tragedy enacted before our straining and somewhat imperfect vision. If life on Mars were to be wiped out while our scientists are still debating the comparative advantages of a ten-mile mirror or a bell 100,000 feet in diameter as means of interplanetary communication, it would have shown that Chance, and mocking Chance, does rule the universe.

Like many another important item of Philippine news, the official announcement that W. Cameron Forbes, the Vice-Governor-General of the islands, has succeeded Gen. James F. Smith as Governor-General of the archipelago has attracted practically no attention. Mr. Forbes would seem in many respects to be admirably fitted for long service in his new post. A member of a distinguished Massachusetts family, of independent fortune, with an unusually advantageous business career opening before him when he gave up everything to go to the Philippines in 1904, he is but thirty-nine years of age. He has already done hard and faithful service in Manila as secretary of commerce and police and as Vice-Governor. In Mr. Taft's eyes he finds special favor because he is thoroughly in sympathy with the President's policy of indefinite control of the Philippines. Just here enters the scruple of doubt. A grandson of J. Murray Forbes, the great Boston merchant and abolitionist, the new Governor-General has yet to show that he shares the family views on the vital issues of democracy and human liberty. The Philippine future is full of sinister omens, despite the final rendering of tariff justice to the islands. To Mr. Taft this means prompt economic prosperity, and it ought to help greatly, though the last figures show a falling off in our trade with the islands. But the trouble is that the Filipino is absolutely ungrateful for all favors, so long as they come from American hands.

To the outsider who is not quite up on the fine points of mind and matter in the universe, the quarrel between New York's leading Christian Science church and the mother church in Boston is now in a hopeless state of complexity. When a witness may testify to the truth verbally in one way, and spiritually in another, we face a condition of affairs where nothing but a firm belief in malicious animal magnetism can help us. At first sight the quarrel would seem to be about very tangible things. A gifted and successful "reader," a woman, is suspected of cherishing personal ambitions dangerous to the unity of Christian Science, and, presumably, to the material interests of the governing body in Boston. In addition to so seemingly tangible a cause, we have such other seemingly corporeal facts as congregational meetings, a presiding officer, speakers on either side, a casting of ballots, a victory for the majority, and a vote of confidence. But the outsider's puzzlement begins when majorities are described as "truth" and minorities as "evil" and "error." This testifies to a blending of body and spirit which most of us have not yet attained.

The tension in England over the Budget is indicated by Mr. Balfour's language in reply to some utterances of Mr. Ure, Lord Advocate for Scotland. Mr. Ure had in several speeches stated that the aged poor of the country were fearful of losing their pensions if there were a change of government, and that he shared their apprehension. These statements were made the basis of a terrific arraignment by Mr. Balfour in a speech before the Junior Constitutional Club. "I do not wish," he said, "to judge too harshly the expressions of an excited orator talking to an excited audience. . . . It is the frigid and calculated lie which moves my indignation." And this was but the beginning of the ex-Premier's denunciation. The accusation of deliberate falsehood is based on the assertion that "no Government could if they would, or would if they could, interfere with these old-age pensions, and that you might as well think of repudiating your obligation to the national creditors as repudiating your obligation to those recipients of the national bounty." To this it is replied by Mr. Ure and his defenders that such may be the feeling of the Opposition, but that ways and means must be provided, and that Mr. Ure's statement was simply a challenge to Mr. Balfour to produce his programme and show that he could raise the necessary sum.

Whatever the merits of this personal controversy, there is one conclusion which it can hardly fail to force on the mind—that of the probable far-reaching effect of the old-age pension policy upon the whole character of British politics and government. The combination of democratic institutions, in a highly developed commercial and industrial country, with a vast system of governmental bounties to individuals, is something the working of which the world has never yet had an opportunity to witness; but it requires no gift of prophecy to forecast some of its inevitable consequences. One of these, and by no means the least serious, is sharply indicated in this Ure-Balfour episode. It was not for nothing that the leader of the Conservative party went so far beyond his own usual practice, and that of English statesmen generally, in the violence of his language; a new force, with untold potentialities of mischief, was invoked by Mr. Ure's appeal. If every contest for the

possession of the Government is to be made the occasion for bids by one party, or both, for the votes of the old-age pensioners and their friends, men who cherish the traditions of English government must feel that the outlook is dark indeed. The history of the war-pensions issue in our own politics may serve to give a faint indication of the demoraiization that may be possible in a democratic country when, instead of a temporary issue affecting a special class, it becomes a permanent issue involving a large part of the entire population.

The chances of a better understanding between Germany and Great Britain grow brighter. Rumor persists in dwelling on the imminence of peace overtures from the side of Germany. The new Chancellor's somewhat vague aspirations towards peace are reinforced in other influential quarters. Throughout the late years of Anglo-German strain our attention has centred entirely upon British scares and fears. But it would be absurd to think that the German Government, too, has not had its qualms, or that the German Empire has not its problems, which, like England's, work for peace. The recent sudden development of the Socialist menace cannot help influencing the Emperor's foreign policy. When five-sixths of the people of Berlin cast their votes for Socialist candidates, it is plain that the Kaiser's subjects are sick of the burdens imposed upon them by the Dreadnought fever. Von Bülow must have been aware of the true state of public feeling, but, satiated with office, preferred to resign rather than abandon a policy pursued for years. No such reasons exist to keep the new Chancellor from working for the restoration of common sense.

In Ambassador Bernstorff's address on Saturday, before the Academy of Political Science at Philadelphia, he urged that the almost entire drying up of the stream of emigration from Germany was a complete answer to those who charge the Germans with vast colonial ambitions. In particular, the Ambassador pointed to the German population in Brazil—some 400,000 all told—and showed that it receives scarcely any additions from the mother country. Fewer than a thousand Germans a year now emigrate to Brazil. This certainly looks as if that deadly attack on the Monroe Doctrine by way of Rio Grande do Sul, against which our Germanophobes used to warn us, is not likely to come off. Count Bernstorff dwelt on the other evidences that Germany is now able to provide work and opportunity for her increasing millions at home. There has been, indeed, a great change in conditions with the rise of German industrialism and commerce. Whether it is to be permanent, we must wait to see; but at present Germany is intensively cultivating her own garden with wonderful success. All told, Count Bernstorff's address was peace-loving and peace-promoting.

M. Briand, in his new capacity as head of the French Cabinet, won his first Parliamentary victory on Monday, when the question of electoral reform came up in the Chamber. After that body had voted to change the system of voting for Deputies from the *scrutin d'arrondissement* to the *scrutin de liste*, the Premier intervened and by making the question one of confidence in the Government forced the Chamber to reverse its previous majority of nearly 240. Under the *scrutin d'arrondissement*, at present in force, every Department of France is divided into electoral districts, of which each elects a single Deputy. Under the *scrutin de liste*, every elector in a department voted for the entire number of Deputies to which the department is entitled; in other words, the same method by which our own Presidential electors are chosen in the different States. The French Republic has repeatedly experimented with both forms. The vote by departments was introduced in 1871, replaced by the vote by arrondissements or districts in 1876, restored in 1885, and once more abandoned for the arrondissement system in 1889. That there was not one more change, between 1876 and 1885, is due to the Senate's rejection of a bill for reëstablishing the *scrutin de liste* passed by the Chamber in 1881 after a great campaign by Gambetta.

The attitude of the judge who is presiding over the sensational murder trial now in progress in Paris can but strike one bred to our notions as unfair and outrageous. Instead of a neutral umpire, he makes himself a violent prosecutor. But all depends upon the point of view and age-long practice. When Charles Sumner as a young man went to France, he frequented the courts both of primary jurisdiction and appeal, and at first was shocked by the intervention of the judges. To his Anglo-Saxon conceptions of judicial propriety, this seemed intolerable. But later he came to a different view, and was ready to concede that the rigid examination of suspected criminals by the judge was often a splendid instrument of justice. A similar opinion, we believe, was expressed by Sir James Stephen. With the complete *dossier* of the case before him, an examining magistrate is often able to succeed better than any one else could in eliciting the exact truth. His bias against the prisoner is more assumed than real, for behind all the rigors of his cross-examination lies the high sense of judicial obligation, and the fear lest, as the judge in the Steinheil case expresses it, a "judicial error" may be committed.

Turkey is the latest victim of Dreadnought fever. Prosperous, peaceful, contented Turkey, with no vast problems of governmental change to work out, with no foreign loans to be negotiated, with no hereditary feuds between Moslem and Christian to appease, with no rebellions in Arabia and Anatolia to subdue, with no bothersome Cretan mix-up on her hands—this happy nation rolling in wealth has decided to spend $100,000,000 on battleships in the course of the next seven years. It may be that the Turkish Parliament which meets next week will hesitate to tread where the Minister of the Navy has rushed in so violently, but that navy-building on a large scale will be taken up by the new régime there is little reason to doubt. Turkey's enhanced reputation among the Powers is due to the demonstration of military efficiency which accompanied the fall of Abdul Hamid, as much as to sympathy for Constitutional government. Ottoman chauvinists probably see in a powerful navy the recovery of Crete, Cyprus, Egypt even—who knows? The significant thing, in the meanwhile, is that the Mediterranean, which only four or five years ago was supposed to have been removed from the sphere of naval competition, is now falling back within the mad circle. Austria is building Dreadnoughts, Italy is building Dreadnoughts, Greece and Turkey plan to do the same.

SENATOR ALDRICH ON THE CURRENCY.

Senator Aldrich's speech of last Saturday to the Chicago Commercial Club makes one thing plain beyond dispute—that no plan for currency reform has yet been agreed on by the Monetary Commission. It is true that Mr. Vreeland, whose chairmanship of the House Banking and Currency Committee makes him an influential member of the Monetary Commission, has taken ground in a public speech for a Central Bank. It is also true that Mr. Aldrich himself, in private statement of his views, has shown his own attitude to be similar. The coincidence, last September, of President Taft's public reference to the Central Bank plan and of the formal launching of an "educational campaign" for such a plan at the National Bankers' Convention, led to popular belief that the scheme would at once be pressed. The truth was, however, that the Monetary Commission had not yet acted formally on any plan. Secretary MacVeagh declared, after Mr. Taft's speech, that the Administration would assume no official attitude in the matter until after the Commission had reported, and Senator Aldrich said as positively on Saturday that "the question of a definite plan for reforming existing conditions has not yet been taken up by the Commission."

Under such circumstances, it was hardly to be expected that the chairman of the Commission would at this time set out to tour the country in advocacy of an expedient of his own, which might or might not be adopted by the full Commission. There seems to have been a prevalent idea that this was Senator Aldrich's purpose, but he is making no such blunder.

There were nevertheless certain passages in the Senator's speech of Saturday which showed that he had a Central Bank in mind. His four important stipulations as to what should be "guarded against or eliminated from any possible scheme" were these: a "credit organization that would interfere with or control existing banks"; an organization "whose resources or credit could be used for speculative purposes"; one "that could possibly be dominated by the financial men or institutions in one section of the country," and one that should introduce the system of branch banking. A glance at these four "eliminations" shows that only a central institution could be referred to, and this brings the discussion fairly back to the Central Bank.

The "branch banking" question is of practical importance, because it touches on an aspect of the matter which has largely inspired such suspicions of the project as exist among inland bankers. If Senator Aldrich's statement, that he does not believe it possible to adapt that system to existing conditions in the United States, is to be interpreted as meaning branches of a Central Bank, it might tend to reassure these local misgivings. But Mr. Aldrich did not touch on the seemingly unavoidable alternative, also objectionable to interior markets—namely, that if a Central Bank were to be the sole depository of government surplus funds, and yet were to have no branches, it would necessarily, at a time when public revenue ran far beyond expenditure, pile up in one locality the proceeds of Federal taxes raised in a hundred other places. We doubt if such a plan would appeal to markets whose own actual money supply might thus be drained away.

That a Central Bank could properly aspire neither to control existing banks nor to interfere with their business through direct competition of its own, is a proposition which will command universal assent. So will the two propositions that its credit resources must not be used for speculative purposes or manipulated by financial interests for their personal advantage. No one in his senses would in the same breath propose an institution of the sort and admit that such use of its machinery was probable. We are not sure, however, that Senator Aldrich realizes how important is the bearing of these considerations on the whole project of a Central Bank.

To forbid by law the lending of such an institution's money to speculators in commodities or stocks, as Mr. Reynolds proposed in his recent speech to the Bankers' Convention, would be simple; but every one conversant with the history of the money market, and especially with the history of the great state banks of Europe, is aware that this would not end the matter. In Europe's experience, the relations of such an institution to the speculative influences of the day are well understood. Only a few weeks ago, the president of the Imperial Bank of Germany, in a speech to the governing board, formally declared that the raising of the bank's official discount rate "was dictated in the main by the wish to curb the excesses of speculation." It is precisely at such a juncture that the question of a central bank's policy being dominated, in its broader aspects, by men or interests who may have a stake in the speculation, becomes of high importance.

The *Yale Review*, in its current number, is impressed with this as the supremely important phase of the problem. It asks how far an American Central Bank could be trusted to perform the function, and answers that, in its judgment, "it is questionable whether men could be found, who, at the head of a great bank of immense resources, would use their power in this conservative way." For ourselves, we are not prepared to go so far as that. There are conservative men and conservative institutions in this country whose ideas are not shaped in Wall Street speculative circles. But the serious question remains as to the pressure which would surely be applied to prevent the exercise of such restrictive powers. The mere assertion from London, a few weeks ago, that the Bank of England had advanced its rate to check the recourse to London's money market by the managers of an extravagant Wall Street stock speculation, was received in America, even in banking circles, with an outburst of angry denunciation. That is not altogether a happy omen.

HONORS TO PEARY.

The award to Commander Peary of the gold medal of the National Geographic Society, and the action of that body preceding and following the award, should have the effect of bringing the question of Dr. Cook's claim to a new stage. The event happens to be coincident with Dr. Cook's return to New York, and it ought to be evident to that gentleman and his friends that the time has come when he must manifest a different attitude, if he is to retain any standing among thinking people. For the salient peculiarity of his conduct has been the apparent desire to put off as long as possible the meeting of any such test as even the most favorably situated claimant to the honor of the discovery of the North Pole would, as a matter of course, have to undergo; not to speak of a man placed, whether by

his misfortune or his fault, under grave suspicion. Commander Peary, whose return from the Far North was considerably later than Cook's, has presented his records, has had them examined, has appeared personally before the committee, and has had his story authoritatively passed upon; while Dr. Cook has allowed nine weeks to pass without furnishing a single item in the way of evidence in support of the bare assertion made in his first story.

The action taken by the National Geographic Society in arranging for the appointment of a committee of experts to inquire into "the question of whether or not any one reached the Pole prior to 1909" points the way for Dr. Cook to correct, if he will, the impression that his conduct thus far has produced. Even if he feels that he cannot, out of regard for the authorities of the University of Copenhagen, submit to this committee the records of his journey, it is perfectly possible to put himself into such relations with it as to give evidence of good faith. And if he should take the ground that the personnel of the committee is such as to give him reason to believe that it is biassed against him, he might easily suggest some other committee before which he would be willing to appear. In default of some move on his part to indicate that he is anxious, or at least willing, to coöperate with those of his own countrymen who desire to arrive at the truth of the matter, there can be but one feeling as to his course. Many weeks are sure to pass before the written evidence he is preparing gets to Copenhagen; the chances are that when that has been done, a personal appearance on his part will be called for, as it was at Washington in the case of Peary; and so another long vista of delay opens up. It must be remembered, moreover, that the University of Copenhagen is in the peculiar position of a tribunal that has pronounced judgment in advance of the trial, and that therefore if its second judgment shall be in Cook's favor, it will still be necessary for an uncommitted body of experts to inquire into the case before the decision is accepted as really authoritative.

The National Geographic Society deserves special commendation for undertaking to probe this question to the bottom. President Moore of the society is quoted as saying that, in its efforts to get the truth before the society's membership of 50,000, it will spare no expense or trouble. In executing this task the society will be performing a public duty; for it would be a reflection on the national character if a question of this kind were allowed much longer to remain in its present condition. The incidental features of the early history of the controversy were such as to throw into the background the essential thing. Here was a man returning successful from a quest which had engaged his unremitting efforts for twenty-three years, and which had enlisted the heroic endeavors of generation after generation of dauntless explorers. The event was one in the acclamation of which the whole world would have united, an occasion of a kind rarely to be paralleled in history; but instead of this exhilarating triumph for the discoverer and this moment of sympathetic jubilation throughout the world, what actually took place was a most unpleasant discussion of the question whether another man, claiming prior discovery, was an impostor or not. Everything else was lost sight of; and we are very much in the same state still. With a firm determination to bring the question to an issue at as early a date as possible, the gentlemen constituting the special committee of the National Geographic Society will, we confidently hope, bring this situation to a close in a reasonable time. What is wanted to this end, above all else, is the personal confrontation of Dr. Cook with a group of competent persons, prepared to put to him those crucial questions which offer no difficulty to the man who has been telling the truth, but which are sure to bring to grief the pretender or the impostor.

CAPITALIZING THE OUTDOOR LIFE.

The pernicious habit of translating human values into money values has invaded the realm of sports. We Anglo-Saxons are looked upon by the rest of the world as the race peculiarly addicted to violent exercise and hypocrisy. The first charge is undoubtedly true; the second may be true. In any case, we seem to reveal a combination of both traits in the fashion we have lately fallen into of showing how moral, how useful, how civilizing a thing it is to kick a football or to shoot partridges. Kicking a football enforces temperance, teaches self-restraint, fosters the spirit of coöperation and universal brotherhood, and generally explains why America has conquered a continent and is destined to shape the future of the world. Partridge-shooting won Trafalgar and Waterloo, covered the Seven Seas, rules India and Egypt, and is now rebuilding South Africa. At first sight it should seem that so beautiful, so spontaneous, so universal an occupation as play would be its own sufficient reason. But we breathe the air of utility; wherefore cricket can be defended only on the ground that it holds together the British Empire by supplying it with calm, resolute, fair-minded administrators, while football is justified in numberless bank-presidents and successful mining engineers.

The argument is stated once again by Professor Mahaffy in the November *Outlook*. His text is a remark by Signor Ferrero, who holds that the old type of English gentleman, the fox-hunting, partridge-shooting English squire, is now an antiquated and false idea. "Against such a theory," says Professor Mahaffy, "I felt in me the protest of a whole life." And the man who has gone into classic erudition as deep as very few other men of his time, tells us how fond he is of angling and shooting, how much it has done for him, and how much it has done for our old friends, the men who rule the British Empire. Says the author of "Greek Social Life" and "The Art of Conversation":

> If I were to regard physical pleasures as the *summum bonum* of life, then I will confess that even if to-day, when I am old, any one were to offer me the choice of spending to-morrow in a noble picture gallery, or at a splendid concert, or in an antique city, with its palaces and churches, or of going out in pursuit of sea trout or salmon, or snipe or grouse, with good hope of success—though the artistic pleasures would be to me a certainty which I have been trained all through a long life to understand and enjoy, though the sport must be an uncertainty and might result in a blank day—I should at once take the day's sport in the country.

But then, on the other hand, it is pretty certain that Ferrero, or Anatole France, or Wilamowitz-Möllendorff would not.

Professor Mahaffy's argument from utility would be convincing if it were not for certain reflections evoked by an article entitled "Sport and Decadence" in the last number of the *Quarterly Review*. This deals with another familiar topic, the deterioration of the sporting ideal—the inroads of professionalism,

the growth of the spirit which plays to win at any price, the cultivation of physical exercise to the exclusion of every other interest. The *Quarterly* writer bewails the fact that cricket is not what it was forty years ago. Boys play without the enthusiasm of boys, and with all the cold calculation of veterans. Veterans do not always play fair. Spectators do not always prefer fair play. Gone, in other words, is the ethical content of sports, its influence for self-restraint, fair-mindedness, mutual helpfulness. But if that is so, how does it happen that during the same time the British Empire has gone on expanding? British administrators brought up on the right kind of sport made a bad mess of things in India—witness the Sepoy rebellion—and nearly drove Canada into revolution. British administrators trained on demoralized cricket and rowing have added Egypt and the Boer Republics to the Empire, and set up three great commonwealths in Canada, Australia, and South Africa. The close connection between field sports and foreign dominion stands imperilled.

The truth would seem to be that athletics and efficiency are not necessarily related as cause and effect. The connection is probably accidental, or at most, incidental. The destinies of the world, we believe, lie at present in the hands of Great Britain and America, and both like outdoor exercise. But let us remember that two hundred years ago the destinies of Europe were shaped by Frenchmen who did not care overmuch for sports. Three hundred years ago unathletic Spaniards conquered a new world. Fifteen hundred years before that, the civilized world was ruled by a race which preferred the enervating hot bath to the cold tub on which the sun never sets. And there are at present some eighty-odd millions of unathletic Germans who have definite ideas concerning Europe's and the world's near future. The Englishman in India probably finds his university cricket stand him in good stead; but the French administrator finds his gift for conversation useful in dealing with African natives; and the German finds his gift for discipline and order equally useful. If a nation passionately fond of stereopticon views and moving-pictures were to win a great naval battle, the connection between vaudeville and victory would not be irrefutably established.

Tying up outdoor exercise with ethics and world-dominion is, therefore, only a disingenuous way of saying that we like to be a good deal out-of-doors. If the foreigner thinks we go in too much for that sort of thing, why not admit that we have had the habit for a thousand years and get a lot of enjoyment out of it? As a matter of fact, our outdoor habits are less closely connected with the march of history than with the phenomena of digestion. If one breakfasts on oatmeal, eggs, mutton-chops, potatoes, griddle-cakes with syrup, ale, and tea, one is apt to feel the need of a fair amount of animated locomotion. Every nation has its favorite method of stimulating the gastric juices. Britons do it by violent exercise. Frenchmen do it by good cooking, light wines, a bit of cheese, and lively conversation. Germans do it by means of beer, tobacco, and silent reflection. An acute French observer would have no difficulty in tracing a good deal of America's love of the open-air to dyspepsia. Not all who walk ten miles a day are drawn by the call of the open. They begin the day by swallowing hot biscuits and wonder why they find it so difficult to stand still. The practice, of course, is not inconsistent with a real love for free air and the trees. We may start under doctor's orders and get to love nature for her own sake. In fact, it would not be out of line with Nature's roundabout methods if she gave us dyspepsia for the express purpose of sending us into the open to observe her miracles.

THE NEW SATIRIC VEIN.

That William Watson's metrical attack upon an unknown gentlewoman should be cabled to this country with columns of speculation and comment, shows, we trust, less a hankering after the sensational than the rarity of the event itself. Satire has pretty well perished, just as modern society seems to need it most. In an England that once had Pope, Gifford, and Byron, your poet rarely names a contemporary except to praise. In fact, the satiric vein hardly outlasted the middle of the nineteenth century. Lowell's "Fable for Critics," with the "Biglow Papers," may be regarded as the afterglow. The poets, Swinburne and Hugo notably, continued to fulminate against dominions and powers, but the old traditions of personal attack were in abeyance. Such a laceration as the Italian poet Carducci dealt to the pedantic grammarian Fanfani was exceptional.

At this point one would gladly yield the theme to Mr. Chesterton. He would prove that this weakening of the contentious note in poetry is the index of our general moral flabbiness. We can hear him demonstrating the futility of pretending to love our neighbor most of the time unless we are sufficiently preoccupied with him to hate him heartily on occasion. One might also cite Whistler's experiments in the gentle art of making enemies. But in spite of Ruskin and "'Arry," the white-plumed champion really hated not individuals, but middle-class institutions. Mr. H. G. Wells in a charming essay on the "Decay of Quarrelling" comes nearer to establishing the laws of war between friends and neighbors. Has the slow music of melodrama, has the insistent bassoon of commerce, replaced the invigorating drumbeat of satire? Mr. Watson rises to answer, No.

Personally, we are a bit discomfited to find the sonneteer who boldly renewed the ample manner of Milton and Wordsworth, in satire a running mate of Kipling. "The Woman with the Serpent's Tongue" is too obviously half-sister of "The Vampire." And Mr. Watson departs from the finer traditions of the satirical code in aiming not to cripple but to kill. The appropriate response would seem to be not a more stinging poem, but a caning from the male relatives. Where absolute violence comes in at the door, poetry escapes through the window. We might refer Mr. Watson and his followers to the debate between the French and the Italian schools of swordsmanship. The Italian tactics are summary, direct, and formidable. In a bout, the Italian *maestro* will usually pink his man. But lovers of the classic duel have justly pointed out that the institution exists, not for the sake of slaughter, but for adjusting affairs of honor, to secure which end it suffices to win a mere tactical or moral advantage on the stricken field. To jump in tiger-like and impale your opponent abridges a stately spectacle and deprives the event of that traditional element of give-and-take which is the essence alike of true sword-play and fine manners.

Yet we heartily hope that Mr. Watson is a harbinger. Our age needs the satir-

ist. Never were pretence and fatuity so full blown. Just one month of Pope or Boileau, or better yet a reincarnated Horace vouchsafed for a space, might help us to see ourselves; one Rabelaisian laugh might dislodge the tabernacles of conceit, in which we sojourn so complacently. One could wish that Mr. Watson had chosen to be less an innovator than a renewer of the broken tradition of classic satire. Why should one wish to slay folly in institution or individual? There is something cramping to the imagination in so definite a purpose. The excuse for satire is the immortality of folly. The sport lies in prodding the monster, in making him forego the solemnity through which he imposes himself upon mankind. The satirist should, in a manner, acquiesce in the fatuity of the world that he may undermine it the more effectually. He may even succeed in loving his victim a little, or if this be impossible, he should at least find his theme too engrossing to be rashly exhausted. The new satire, when it does come, will, we trust, partake rather of the humane indirection of Erasmus than of the bludgeoning of the Kipling school. Or if Erasmus and Horace seem a shade too genial for work-a-day purposes, at least let us try to revive the merciless wit of Pope and the volcanic raillery of Byron.

POETRY AND ELOCUTION.

Questions about the decadence or the revival of poetry, its present state, and its prospects, are nearly always discussed in terms of the supply rather than of the demand. One is apt to ignore the essentially social character of the art, and to forget the function of the consumer—a brutal word—not only in his desire for poetry, but in his appreciation of it at its noblest and best. Years ago, a young instructor at Harvard was asked to join in the public readings then coming into vogue, and was advised to give Spenser or one of the modern English classics. Full of ardor, he hied to the chief of his department, and, sweeping aside the moderns, begged leave to read and interpret "Beowulf." "'Beowulf!' Why?" "I should like to do some missionary work." "Good! But where," and the words clicked out in harmless malice, "where are you going to find your heathen?"

Where can the poet now find his heathen, his gentle readers? What is the poet's public to-day? Who reads him, who quotes him? Along with Greek and Latin literature, English poems are assuming the part of a protected industry; they are studied more and more in the classroom, and are read less and less by the fireside. What would the publishers' books reveal about this case? Certainly they would show that except for school and college editions of the standard poets, and except for a pair of clever versemen whose popularity rests mainly on feats in prose, the publication of poetry is unprofitable and undesired. Not very long ago, to be sure, "new" poetry was marketable. When an untried and inferior poet once sent a specimen of his verses to Swift and asked for advice about getting them into print, the dean, without satiric intention of any kind, simply assumed a regular market for the stuff, quoted the usual rates, and advised his correspondent to try no publisher outside of the metropolis. A decade or so later, Johnson's "London," the work of an absolutely new man, took the town by storm. Dryden's "Absalom and Achitophel" had been the champion "seller" of its day. Next came the turn of the popular narrative poem, compressed, rapid, memorable, such as could make fortunes for Byron and Scott. We seem to have passed, scarce a generation ago, the end of this era. Tennyson's "Enoch Arden," in 1864, sold at once to the extent of sixty thousand copies, while, not far from the same date, Whittier and Longfellow made more modest successes with the poetical tale. Then fell the modern blight upon all verse save lyric; and even lyric has to live mainly on the compassionate magazines. It is no longer true, as it was in George Herbert's day, that "a verse may find him who a sermon flies." Even sermons, of a kind, have a better market than poetry.

Poetry, then, is asking not simply for its poets but for its gentle readers. It looks for help not from those who read it for revenue or under the ferule, but from those who demand great verse because they love it, and who make the mute but vital response to genius. The supply of this genius rests upon the knees of the gods; but the demand for it is controlled by the actual conditions of society, and these conditions to a large extent are susceptible of reform. Poetry in some shape is a primary instinct of social man; but an instinct can be repressed and its activity can be confined by agencies so wholly within our power and so close to us that we fail to appreciate what they are doing. If poetry is losing its vogue, one reason for the loss is because we fail to treat it as poetry. We stop our ears deliberately to the charm of verse as verse; we ignore the appeal of rhythmical utterance. Whenever poetry is quoted or recited in these latter days, its fundamental quality is suppressed; and in the silent reading of it no attempt is made to realize, to make audible to the inward ear, that purposed march and cadence of its lines. Elocution, as one styles the art of reading passages so as to bring out all that was put into them, is thus at disastrous odds with poetry; and teachers from kindergarten to college are striving to make us forget what noble numbers mean.

This journal has already insisted on the need of reviving the forgotten habit of reading books aloud. Mr. W. B. Yeats, on the wider theme of restoring "democratic" poetry to its rights, would revert altogether to oral delivery of verse. But how is this verse to be read aloud, whether by the poet or by the lover of poetry? As verse, to be sure, said our forefathers. As prose, say our modern teachers of elocution, along with the noble army of platform-men. "Be natural; be colloquial," they bid; "avoid in reading poetry all suggestion of a metrical scheme." Here is fine revolution from older practice! Originally sung, poetry came to be chanted, then read aloud with full emphasis upon the rhythm; but centuries of silent reading have at last reacted on oral delivery, obscuring this rhythmic throb and stifling the pulse of verse, while an over-strained fear of the pathetic and sentimental helps nowadays to condemn all recognition of metrical values as bad taste. If then we desire to win back some of the lost delights of poetry by reading it aloud, we must not simply retrace the steps from sound to silence, but we must restore to poetry its primary intention as cadenced and melodious verse.

Where shall the reform begin? With that chief of sinners, the platform-man, the reader by profession? With the teachers of elocution? Or shall we plead with the lords of the stage? Booth and even Irving still let one know that they dealt with verse; but they are lapt in lead and their elocution with them—save for such sporadic and not quite relevant cases as Mr. Bispham's reading of the "Antigone," and Dr. Furness's wholly adequate reading of Shakespeare, now so seldom heard. French and German actors got rid of poetry in their drama decades ago. Scherer, writing at Berlin in the eighties, said that the best German players, in order to perfect their colloquial tone, had their parts in iambic verse written out for them as prose; and he contrasted with this precaution the rules of the Weimar stage, under Schiller and Goethe, which demanded a metrical declamation. He traced the parallel change from rhythmical to "natural" utterance among French actors, setting against the pathetic tremolo and cadenced line of Talma the colloquial though exquisitely modulated style of Sarah Bernhardt.

Well, the lords of the stage are many; and they are arrogant; and it is vain to appeal to them in the name of injured Poesy while the shadow of Ibsen

and the substance of Mr. Shaw still prevail. Poetic drama, too, is dead, though our hopes are with Mr. Brander Matthews for its resurrection; and so we turn to the one vital part of poetry, the lyric, and submit a modest plea that when it is read aloud, in school, on the platform, by the fireside, it shall be read as verse. Read in these places now, it is nearly always a case of calculated and effective slaughter, so far as rhythmical values are concerned. And what is a lyric without its rhythmical values? What is the wild water of a brook when it is dammed into a duckpond? The very tropes and figures depend upon this charm of movement, like flashes of light thrown back by the hurrying waves. Yet we are so afraid of singsong, and even more afraid of the pathetic and sentimental, that we suppress all cadences, and come out triumphant with a hybrid sort of performance that reminds one of a bird which should flap its wings without flying. We sin against the nature of poetry, in order to be natural as we conceive nature in these latter days. Scherer, whom I have just quoted, falls into a fine quandary on this matter of reading lyrics aloud. Of course, he says, one ought to read verse in "natural" tones; but there was Emanuel Geibel, as good a lyric poet as Germany could then show, who read his own poems in what seemed at first an "unpleasant" way. "There was something 'singing' in his elocution, something that strove above the natural tones"; but, Scherer goes on, one soon began to feel that the "something" was not unnatural at all, but "a peculiar poetic element, a mode of speech *sui generis*," a method which carried its own conviction of truth. Geibel, in a word, was reading poetry as poetry; that was all. If Scherer could have heard Tennyson, he would have learned something more to his advantage. Coleridge, Wordsworth, Scott, by good evidence, all read their verses in "a kind of chant"—so Hazlitt affirms of the former two—which "acted as a spell upon the hearer." This chant was not singsong; singsong simply shows the "feet," baldly asserts metre, while rhythmical reading does justice to cadence and the harmonious movement of the verse.

Cannot, then, the restitution of rights to poetry be started, in however humble fashion, by a stout insistence upon its rhythmical values and by a branding of the Philistine, whether teacher or professional reader, who refuses to acknowledge them? If we think that Tennyson knew how to make a lyric, let us concede the soundness of his ideas on the way in which a lyric should be read aloud. Let us root out utterly that abominable cheerfulness with which school children, particularly girls, are taught to "render" threnodies like Cowper's "Toll for the Brave." And let us ostracize, or, more simply, lynch the adult who reads "Lycidas" as if it were the trial scene in "Pickwick."

Francis B. Gummere.

Haverford, Pa.

THE FERRER AFFAIR.

Paris, October 28.

A spontaneous explosion of free thought is insufficient to explain deliberately organized demonstrations among widely varied popular masses, who are as ignorant of free thought as they are of Ferrer. There are, indeed, four likely sources of party ebullition in politics and religion—Freemasonry; anticlericalism, which comprises all hatred, inherited or acquired, of Roman Catholics and their religion; Socialism as a political party living by agitation, and anarchy both of the intellectual and militant sort. With all their lack of union among themselves, there are certain electioneering interests common to these parties, at least on the Continent of Europe. In France recent events can leave no doubt about this.

Are the negative union against the Catholic religion and the positive union of political interests enough to produce spontaneously, without a directing head, this international resultant with its wonderful unity of crowds of so many different nations and antecedents, all insisting on some facts and ignoring other facts equally notorious, all taking for granted facts not yet ascertained, all giving vent to violent passions for or against certain abstractions which can only mean, in real life, that they are inspired to sympathy for certain classes of men around them and to distrust and hatred for certain others? Or, as the German Socialist, Liebknecht, thought he discerned in the corresponding development of the Dreyfus affair, is there some hidden *chef d'orchestre* who waves his bâton and directs the concert of all these bands?

Several of the most eminent Liberal journalists and correspondents of Spain have thought it their national duty to protest with the foreign press. They have done so with great clearness and reason, but to little effect. Anatole France gave notice long before the trial that the whole world would refuse to accept any condemnation of Ferrer, "whether by civil or military court," in Spain.

Keir Hardie, in the British Parliament, made it his chief grievance that Ferrer had not been turned over to the civil courts; but this the Spanish minister pointed out to the Cortès would have been contrary to law. Others have made capital of the trial by "court-martial," which it was not in the sense of summary jurisdiction, such as was exercised in France against thousands of the Paris Commune. As the minister also pointed out to the Cortès, the government did not use its rights of passing the Barcelona insurrectionists through a court-martial, but handed them over to the regular routine of law, which, in Spain, means the legal military tribunal. Whatever one may think of Spanish law, it is the only law existing in Spain.

This legality of the trial and condemnation of Ferrer is a first fact universally ignored by the agitators in France and elsewhere. The constitutional limitations of the royal prerogative in Spain have been equally ignored in the direct attacks made on King Alfonso for not exercising his power to pardon. These attacks in the French and Belgian press, and in countless meetings, have gone to the length of suggesting plainly to anarchists that the King is a fit object of their vengeance.

Another series of facts has been systematically ignored in all these international demonstrations; and in France, the demonstrators have done worse than ignore them. Señor La Cierva, in his last unlucky speech to the Cortès, which upset the Maura ministry, enumerated them briefly: "The number of religious buildings burned in Barcelona was sixty-eight; among the victims there were 138 dead and forty wounded."

The nuns of Barcelona, who were the chief victims, have been accused, tried, judged, and condemned—without any production of evidence—as the real criminals. The *Dépêche* of Toulouse is one of the most prominent republican journals of provincial France. This paper allowed itself to print an article about Barcelona convents in the most approved Maria Monk fashion. Some of the nuns are sisters and daughters of French families of high position. A French priest, with the permission of the Archbishop of Barcelona, has obtained the signatures of all the nuns and sisters of the convents to a suit for libel to be brought in the French courts. It is little likely they will have redress, although the ignoble stories were obviously taken in whole cloth from dime novels and correspond to nothing in present-day convents.

Camille Pelletan, in the Paris *Matin*, related over his own signature that a dealer in Barcelona (he does not give the name) told him that a sister from a convent asked him for the job of printing indecent postcards; and, when her attention was drawn to their character, she answered that the work would be sanctified because it would be done "in the interests of the Church." The use of such a formula, impossible among any Roman Catholics, nuns or not, as any one knows who has associated with them, but which is found constantly in anti-Catholic controversy, at once earmarks the story. M. Pelletan, as Jules Lemaître remarks, has not forgotten the revocation of the edict of Nantes. Thus women who have lost the homes they had chosen freely, the property which they had earned, and even their

lives, are now condemned, on irresponsible hearsay, to the loss of their good name, while Ferrer is glorified.

On the other hand, it is assumed in all the demonstrations that "Jesuits" or priests in control of the Spanish government directed the execution of Ferrer. If men, and not phantoms, they should have names; but no one even pretends to answer the Irish member of Parliament's request for them.

Yet other facts, which are known on evidence other than hearsay, are equally ignored in France and elsewhere. They concern the person of Ferrer, whom the Manchester *Guardian* describes as "a noble-minded servant of the truth, as he saw it"—his execution, of course, being a "judicial murder." From less unexpected quarters similar phrases were used of the Chicago protomartyrs of anarchy and of Vaillant, who inaugurated in France the anarchist terror by throwing into Parliament a bomb which killed no one, but for which he was guillotined.

The Spanish Government declares in vain that Ferrer was not tried or condemned for teaching anarchy—"the truth, as he saw it"—in his modern schools, nor for indirectly preparing the Barcelona insurrection, nor for any other "political crime" or *délit d'opinion*, as the demonstrators universally assert. He was condemned and executed for direct participation in acts which even *Le Radical* newspaper of Paris, before his trial warned his friends "excite universal reprobation"; for which reason, perhaps, they are now ignored. The new Moret ministry has begun by renewing the promise of Señor Maura that all the evidence in the case shall be published. Without prejudging what this may be, it is certainly unfair to ignore the perfectly well known record of Ferrer both in France and Spain.

Self-educated (which is to his credit as a man, but not as a thinker reforming others), he began in Paris as a teacher of Spanish at the Grand Orient of the Freemasons. For whatever reason, his wife left him and took with her their two daughters, who have been brought up without his influence and support. One earns a few francs a day as a working woman; the other is a promising actress. It is the two infant children of the former whom the Socialist Board of the Municipal Council of Paris probably wishes the city to adopt, although it has paid no attention to the needy widow and children of the Paris policeman killed in the Ferrer riot. The daughter of Ferrer who petitioned King Alfonso's clemency for her father, has taken care to write to the newspapers that the friends with whom she has now taken refuge do not share his opinions. The comic note in the tragedy is furnished by the address of Liverpool Nonconformists, condoling with the "wife and family" of the executed man. The picturesque and even heroic woman who appeared with him at the end in Spain never professed to be his wife, nor did his teachings make it proper that she should.

In Paris Ferrer as Spanish teacher met the unmarried French woman of means who, at her death, bequeathed him a house and revenues estimated at 750,000 francs. Her executor, M. Coppola, referring to the Paris notary with whom the will was deposited, M. Tabouret, now comes forward to say that her intention was to found in Barcelona an infant asylum, and not to subsidize the anarchist schools to which Ferrer applied the money; and that, as her instructions were contained in private letters and not in the will itself, it was impossible to prosecute him for abuse of confidence. She did profess the Catholic religion in her will, and leave a bequest for masses for her soul.

For his propaganda Ferrer issued in Spain translations of the popular primers of Reclus, Kropotkin, Jean Grave, and Charles Malato, who was his closest friend in France. Whatever may be the sincerity, high personal character, scientific acquirements, labor, and simplicity of life of such men, it is impossible to blink the outcome of their teachings in practice. In France they were marked by a train of bomb explosions and blood from Vaillant to Emile Henry. It must be a singular vision which sees better things in the still longer succession of Barcelona bombs, fire, and bloodshed. The explosion which killed its score of innocent bystanders at the King's marriage, and stained red the bridal robe, was also traced directly to one who had been domestic, secretary, or school-teacher of Ferrer.

Up to the present writing, fifty-nine French municipal councils have resolved to name a street in honor of Ferrer. In Paris, on Sunday, the 31st, the University Association of Republican Students, with the Dreyfus League of the Rights of Man, the Popular Universities, Socialist Youth, and numerous Masonic lodges, under the National Federation of Free Thought, are to place a monument of Ferrer just in front of the great memorial church of the Sacred Heart. The Freemasons of Troyes have asked the French Grand Orient to begin a movement for placing his statue over against the Vatican in Rome; and Mayor Nathan of Rome, where he was long Italian Grand Orient, has officially eulogized Ferrer and blamed his execution in violent terms, although Barcelona nuns have not interested him. Yesterday the German Socialist organ—*Vorwaerts*—declared that "the heroes (not the nuns) fallen at Barcelona have not died in vain." In France the General Federation of Labor, in various meetings and resolutions, even proposes the Barcelona insurrection as an example to French workmen.

Camille Pelletan and the Radical Socialist politicians have found their sorely needed electioneering issue for next May in the renewal of anti-Clericalism excited by the execution of Ferrer. In England Primitive Methodists and the Congregational Union have voted their preference of Ferrer, atheist and anarchist, to Roman Catholic Christianity. Who has led all these otherwise discordant bands? S. D.

NEWS FOR BIBLIOPHILES.

In gathering first editions of American authors Frank Maier has covered a broader field than most other collectors. His collection, the first part of which will be dispersed by the Anderson Auction Company on November 16 and 17, and the second part on November 22 and 23, contains several volumes of colonial verse, the most important being "The Poems on several Occasions by Aquila Rose," printed by Benjamin Franklin in 1740. Rose was a printer in the shop of William Bradford, and was also clerk of the Pennsylvania Assembly. He died in 1723. His poems were collected by his son, Joseph Rose, who was apprenticed to Franklin. In the *Pennsylvania Gazette* of June 21 to 28, 1739, there is a notice signed by him to the effect that he was intending "to collect and print the poetical writings" of his father, and asking "all persons who are possess'd of any of those pieces in manuscript to bring them to" him, promising "to give in return for each manuscript, one of the printed collections, as soon as they shall be finished." The Maier copy of the book was secured at the Proud sale in 1903, where it brought $250. No other copy seems to have come upon the market in recent years. Other early volumes are Mather Byles's "Poem on the Death of King George" (Boston, 1727); Benjamin Church's "The Choice" (Boston, 1757); Thomas Godfrey's "Juvenile Poems" (Philadelphia, 1765); "The Patriots of North America," a Tory tract in rhyme, printed in New York by James Rivington in 1775; novels by Charles Brockden Brown; a long series of plays by William Dunlap, and first editions of poetical volumes by Freneau, Peter Markoe, Mrs. Morton, and others.

Of interest to a larger number of collectors, and often of much greater value, are the first editions of the great authors who, about the middle of the nineteenth century, took the position they still hold. The Bryant collection (ninety-seven lots) includes "The Embargo" (1809), "Poems" (1821), and "The White-footed Deer" (1844). The Emerson collection (ninety lots) includes "The Historical Discourse before the Citizens of Concord" (1836), "Nature" (1836), "Essays" (1841), and "Poems" (1847). Among the Hawthorne rarities are "Fanshawe" (1828, the copy which brought the record price of $840 in Boston in October, 1902), "The Gentle Boy" (1839), "The Sister Years" (1839), "The Celestial Railroad" (1843), and the little children's books "Famous Old People" (1841), "Liberty Tree" (1841), and "Grandfather's Chair" (1841). The Holmes collection begins with the six numbers of the *Collegian*, containing twenty-four poems by Holmes.

Some special Longfellow, Lowell, and Poe

items (the most important of the collection) will be noted next week.

On November 18 and 19 the Anderson Auction Company will sell a collection of standard books, including first editions of Oscar Wilde and other modern authors, a series of books from the Ephrata press, a first edition of the Sauer Bible (1743), etc.

On November 17, 18, and 19 the Merwin Clayton Sales Company will sell a collection including the library of Daniel Kaine of Uniontown, Pa. But few, if any, items of note are included.

The following are some of the most important records at the sale of the second part of the J. C. Chamberlain collection, held at the rooms of the Anderson Auction Company on November 4 and 5: T. B. Aldrich's "Père Antoine's Date Palm" (1866), two presentation copies, the one given to B. H. Tieknor bringing $76, and the one given to Bayard Taylor bringing $85; Aldrich's "Pansy Wish" (1870), put in type by two girls, and two editions printed for sale at two different fairs in Boston, first issue, with A. L. S. of Aldrich, $70, second edition, with these two words in the author's autograph on front cover, $31; Hawthorne's "Fanshawe" (1828), $350; Longfellow's "Outre Mer" (1833-1834), the very rare original issue in two parts, in paper covers, as issued, but top of the cover and three leaves of Part I injured by mice, $310; Lowell's "Poems" (1844), removed from binding and cleaned, $60; R. H. Stoddard's "Footprints" (1849), a thin pamphlet, his first volume of poems, suppressed by the author, $150; and Whitman's "Two Rivulets," etc., Camden, 1876, with many manuscript corrections for a new edition, $137.50. Many old books sold low, the large paper copy of Lowell's "Poems" being a real bargain. The Brown University duplicate copy, which sold in 1901 for $150, resold in the first Chamberlain sale last winter for $330.

Correspondence.

SHIP BUILDING SUBSIDIES.

To the Editor of The Nation:

Sir: In view of the present agitation for government subsidies to aid our mercantile marine, the following facts may be interesting to your readers.

In 1886 the International Navigation Company, then operating the American line (with four American and four English ships) between Philadelphia and Liverpool, and the Red Star Line (with all ships under the Belgian flag), between Antwerp and New York and Antwerp and Philadelphia, bought out the well-known Inman (English) line, running between Liverpool and New York. In 1892 Congress, influenced by the clamors of the subsidy hunters, repealed the navigation laws in favor of two of the newest and fastest ships of the International Company (the City of New York and City of Paris). One of the conditions of this transfer from the English to the American flag was that the International Company should build an equal amount of tonnage in American yards.

At the same time, the government granted these boats a subsidy of $4 per mile for carrying the mails, a much higher rate than the British government ever paid.

In March, 1893, a new service was inaugurated by the International Company between New York and Southampton, called the American Line, and patriotic Americans were assured that at last they had a transatlantic line of their own in every respect. How far this was correct can be judged from the following facts: Capt. Frederick Watkins, the commander of the City of Paris (or Paris, as she was called when transferred to the American flag), was an Englishman who had been in the employ of the Inman Line since 1862. When his ship changed flags, in order to retain his command and, at the same time, comply with the American laws, he became an American citizen by naturalization. Fully ninety per cent. of the officers and crews of this and the other ships were foreigners also. In 1895 the now well-known St. Louis and St. Paul were built for this line by the Cramps at Philadelphia. They were "to beat everything afloat," but so far have never broken a record. After her accident in 1899, the Paris was renamed the Philadelphia. She was rebuilt at the Irish ship yard of Harland & Wolf, Belfast; and here it is edifying to note that when Congress was originally applied to for a subsidy to the American line, one of the reasons given was the help to the American shipbuilding industry. The repairs of the Philadelphia in Ireland must indeed have been a great help to our shipbuilders. From 1895 to the present day, while other companies have been continually building new ships, the American Line has not added a single new vessel to its fleet; but this, it is to be supposed, matters but little to them, as they have long been under the sheltering wing of that polyglot combine called the International Mercantile Marine Company (better known as "Morgan's Shipping Trust").

In 1902 the Shipping Trust had built by the Cramp Shipbuilding Company at Philadelphia two steamers for their Red Star Line, the Kroonland and the Finland. Last year these boats, and this year another one called the Samland (also owned by the Shipping Trust), were transferred from the American to the Belgian flag, the reason given being "that it was too expensive to run them under the American flag." To the initiated however this is only another scheme to try and influence Congress to grant our mercantile marine subsidies.

Francis B. C. Bradlee.

Marblehead, Mass., October 24.

[It is but fair to say that the Paris, after her wreck on the English coast, could not have recrossed the ocean for repairs on this side. Otherwise we think that the points of this letter are well made.—Ed. Nation.]

OLIVER WENDELL HOLMES—DOCTOR AND GENTLEMAN.

To the Editor of The Nation:

Sir: One of the most pleasing diversions of a desultory traveller in England is found in the book shops. It makes little difference whether one strays into a great London house, where rare volumes and hand-tooled works are a delight to sense and sight, or into a low-ceiled room in a crooked Oxford lane, where the oldest, the newest, the best of the world's literature is heaped together, or into some unfamed, dim-lit shop where the stranger becomes a guest having once passed the threshold.

At the stationer's at Ilkley-on-the-Wharf I stumbled upon a British edition of "The Autocrat." Nothing, I am sure, would have given more pleasure to Dr. Holmes than to have placed this little book upon his shelves. In justice to Mr. Chesterton, who has given us in the introduction his critical analysis of Dr. Holmes as doctor and gentleman, it should have a place among the ana of the autocrat and humorist; and in justice, moreover, to Mr. Blakeney, M.A., of Trinity College, Cambridge, who has annotated the text with such fidelity to British opinion, who has chased the vagrant thoughts of the author to the uttermost recesses of the University Library, and impaled them so inflexibly that not even through the genius of the man who dared not write as funny as he could, would it be possible to make them live again.

I had been loitering over the book shelves here, hoping to find some old friend or new acquaintance to take with me over the moor, and when this attractive volume came to hand I paid Dr. Holmes the respect of opening it, intending to read a few words and lay it aside. But some happy instinct directed my hand to the last pages of the book; for a moment only a column of indistinguishable "notes" met my eye, then from this wealth of information a single line took shape and meaning:

Note 48, Somerville, mad-house near Boston.

I couldn't place Dr. Holmes's allusion to the city across the Charles, but I at once understood why the ancestral residence of some aristocratic friends of that town is now found at Winter Hill. My curiosity was aroused; what might I not find to bear this company! I turned a leaf and was rewarded by this ingenuous bit, which followed notes on "Linnæus," "Infelix Dido," "Gil Blas," "Disraeli," and "Great Pedlington:

Note 74, "that fair sheet," *i. e.*, Frog Pond on Boston Common. As the "Autocrat's" boarding house was in Boston, he naturally found the local names and associations of the place sufficient for his use.

That decided me; I had found something old *and* something new; right cheerfully I gave up my half-crown, pocketed my find, and hastened to a sheltering cairn on the moor-side, where I could explore this mine of brilliants at my leisure.

Mr. Blakeney's "Note 74" is especially delightful, because not one-tenth of the three hundred and fifty notes has reference to any colloquialisms. The bulk of the forty pages deals with translations, quotation, and "what Dr. Holmes had in mind." But if the quantity of strictly American notes leaves something to be desired, the quality, I believe, is unsurpassed. I pass over the mere pleasantries to seize this comment on "The One Hoss Shay":

Note 285, "Hahnsum Kerridge": surely an anachronism. The patent for "Hansom Cabs" was not taken out till 1834, or twenty-four years after the date, 1810, given here.

And with careful regard for *all* the facts a footnote is added:

So named from the inventor, Hansom, architect of Birmingham town-hall.

Not wishing to dim the brilliancy of this gem by heaping lesser lights about it, I turned to the beginning of the book and

there discovered the introduction, a joyous effort of Mr. Chesterton's to explain Dr. Holmes to the British public. So far as I could gather from later investigation the public accepted the explanation with the same complaisance as it showed to the "anachronism" of the "Hahnsum Kerridge." Possibly this exposition of how a man may be a doctor and yet be a gentleman is too entirely British to be properly appreciated on this side of the water, but the presentation of Oliver Wendell Holmes as the literary voice of the South cannot fail to arouse enthusiasm.

"General and fantastic," says Mr. Chesterton, "as was the characteristic writing of Oliver Wendell Holmes, there was at least one element in it which was really dominant and consistent, and that was the influence of his profession. A good doctor is by the nature of things a man who needs only the capricious gift of style to make him an amusing author. For a doctor is almost the only man who combines a very great degree of inevitable research and theoretic knowledge with a very great degree of opportunism. He unites, as it were, the exact virtues of a botanist with the wilder virtues of a commercial traveller. . . . The result of this fusion is a certain quaint wisdom, a certain variegated experience, and sudden synthesis which is preëminently characteristic of Holmes. This is preëminently characteristic of him, and it is characteristic of the one other man in literary history who bears a curious resemblance to him. Sir Thomas Browne was also a physician, he was also a fantastic, he was also a humorist and devout philosopher. In him also we have the same bewildering ingenuity of allusion and comparison, the same saturnalia of specialism, the same topsy-turvydom of learning."

Just here, Mr. Chesterton catches a comparatively long breath—several lines—before his superlatively adjectivized utterances get the better of him and he loses himself in "luminous mysticism" and "Elsie Venner." However, he recovers in time to assure us that "It would be false and exaggerative in the last degree to speak as if Holmes's warm-hearted rationalism threw him into antagonism either with the Christian churches or with the Declaration of Independence." We wonder if Mr. Chesterton could possibly have come across that schoolroom perversion recorded by Mark Twain: "Oliver Wendell Holmes is a very profligate writer."

But no, Mr. Chesterton has really a high opinion of "Wendell Holmes."

"Of all American writers," asserts Mr. Chesterton, "he is the least democratic; he is not only the doctor, he is very decidedly the professional man, the gentleman. In American literature, indeed, he may be said to be, not by actual birth or politics, but by spirit, the one literary voice of the South. He bears far more resemblance to that superb kingless aristocracy that hurled itself on the guns at Gettysburg or died around Stonewall Jackson, than to Hawthorne, who was a Puritan mystic, or Lowell, who was a Puritan pamphleteer, or Whitman, who was a Puritan suddenly converted to Christianity. . . . This war of Holmes against everything that hurt that liberality and dignity of living which we summarize in the word gentleman was really a fine thing finely done, a thing needed everywhere, especially in a new country. Still, the fact remains that the union in Holmes of a gay impatience with theologians and a gay impatience with cads is, looked at from another point of view, an evidence of that tendency of all fine naturalistic thought towards oligarchy."

Did Mr. Chesterton "have in mind" when he expressed himself thus emphatically that a surgeon of the old country may also be very decidedly the professional man (so may the hair-dresser), but that only individually is the doctor accepted as a gentleman? As a consequence of this a gay impatience with cads is not one of his characteristics, and he refrains from using his title of M.D. except under strictly professional circumstances, although it is more than probable that his naturalistic thought is all towards oligarchy. But let Mr. Chesterton have the last word, for in summing up he thinks best to qualify somewhat. "In fact," writes he, "there are characteristics in Holmes's books which, when recalled, make me think I have been too sweeping in my reference to the aristocratic flavor of his work."

M. L. ANDREWS.

Providence, R. I., November 3.

A FORGOTTEN SOCIOLOGIST.

TO THE EDITOR OF THE NATION:

SIR: In view of the fervid discussion caused by Prof. Henry Jones Ford's article on "The Pretensions of Sociology" (*Nation*, April 29), it may not be without interest to recall the work of a Virginian who used the word "sociology" in his writing just one year after the publication of Harriet Martineau's translation of the great Positivist's works appeared, and who used the phrase "social science" with a certainty and assurance which many workers in the same domain to-day have longed for and have not seen. Two books were written by George Fitzhugh, a citizen of Port Royal, Va.: "Sociology for the South" which appeared in 1854, and in 1857 a volume with the somewhat startling title, "Cannibals All," to which is added a secondary name, "Slaves Without Masters" Both of these books were published by Adolphus Morris and were printed in Richmond.

The theme of the volumes is the same: the failure of individualistic society. In the first chapter of "Sociology for the South" Mr. Fitzhugh attacks the theory of free trade, so popular in the South of that period, and at the same time hews at that other darling doctrine of the followers of Jefferson, who held that the least government is the best government. The maxims, "Laissez-faire" and "Pas trop gouverner" are the foundation of democratic society, thought the author, and upon them he dealt his most valiant blows. Mr. Fitzhugh held that society is the creator of the individual. His words are:

> He (man) and society are congenital. Society is the being—he one of the members of that being. He has no rights whatever as opposed to the interests of society; and that society may very properly make any use of him that will redound to the public good. Whatever rights he has are subordinate to the good of the whole, and he has never ceded rights to it, for he was born its slave, and had no rights to cede. Government is the creature of society, and may be said to derive its just powers from the consent of the governed; but that government does not owe its sovereign power to the separate consent, volition, or agreement of its members.

Upon these words as a foundation, with the additional idea of the State as the depository of sovereignty rather than the Federal government, his whole structure is reared. Examining society from this angle with the aid of socialistic literature, he found government based on individualism a failure. In England, in Europe, in the Northern States, he thought this universally and inevitably true, since these societies were built upon the conceptions of liberty and unrestrained competition. In his thinking the "Iron Law of Wages" was approximated. In the closing chapter of the "Sociology for the South," he puts it in these words: "Free society is theoretically impracticable, because its friends admit that in all old countries the supply of labor exceeds the demand. Hence a part of the laboring class must be out of employment and starving, and in their struggle to get employment reducing those next above them to the minimum that will support existence." In the first chapter of the same book he likewise came close to the theory of natural selection as a result of severe economic competition, but he failed to see any progress, nor did he christen his doctrine evolution. With him it was all destructive; the strong overcoming the less strong, the weak the weaker, with no upward tendency.

From the socialists came his proof of widespread economic failure of competition. Carlyle's passionate cry, "We must have a new world if we are to have any world at all," rings out again and again through the pages of "Sociology for the South" and of the later "Cannibals All." Stephen Pearl Andrews, Horace Greeley, and William Lloyd Garrison in this country furnished him with background, while St. Simon, Fourier, Owen, Fanny Wright, and others less noteworthy across the ocean contributed to his views. But he had his own method of treatment of the ailment, and his originality consists in the association of Socialism and slavery; for as he viewed things in a slave society, the evils complained of under free competition were never found. In domestic slavery was the secret of salvation. That institution united labor and capital, since labor was capital. Then Mr. Fitzhugh, looking on slavery as it was natural for a kindly Virginia gentleman to see it, conceived of slaves as members of the larger family, and domestic affection seemed to him so to unite slave and master that the cruel antagonism of employer and employee was impossible. Under domestic slavery, as he saw it, the "Iron Law of Wages" was never operative. The master cared for the slave because the slave was his own, and thus the cares and anxieties of the wage-earner were escaped.

Mr. Fitzhugh also contributed a few articles to the *New York Day Book*, the *Southern Literary Messenger*, *De Bow's Review*, and to other papers and magazines. In 1856 he lectured successfully at Yale on the failure of individualism, and it is interesting to note that late in the same year William Lloyd Garrison published a long communication from him in the *Liberator*. The war between the States ended his literary career, decreeing as it did another state of society than that for which he argued.

WILLIAM LUDLOW CHENERY.

Hull House, Chicago, Ill., November 3.

LLOYD-GEORGE'S "SOCIAL DYNAMITE."

To the Editor of The Nation:

Sir: In your article on "Troubled English Politics" in the *Nation* of October 28, you quote certain rather rhetorical sentences of the Chancellor of the Exchequer as specimens of "social dynamite." Divested of rhetoric, the dynamite seems to lie in the charge that the ownership of the larger part of Great Britain is in the hands of a few people who draw an immense income from the proceeds of the enterprise and labor of the nation, without rendering any equivalent service; and that the House of Lords is a political anomaly. In other words, Mr. Lloyd-George points to two obvious pieces of injustice, one of them, namely, the control of the rental of the land in the interest of non-producers, a crying outrage that rests like a yoke upon the necks of many millions of poor people. Surely the *Nation* does not wish to imply that the people of England ought to endure these injustices? But if the Chancellor sees certain great political and social wrongs, oppressing his people, why should he not frankly talk about them? Through many years of reading the *Nation*, I have not been accustomed to liken telling the truth to the throwing of dynamite. But perhaps the *Nation* wishes to suggest that the truth is a kind of dynamite, and will prevail. Charles F. Dole.

Jamaica Plain, Mass., November 3.

CAMBRIDGE CLASSICS.

To the Editor of The Nation:

Sir: Now, when there is so much comment upon ex-President Eliot's assertion that a five-foot shelf of the right books might prove as royal a road to a liberal education as attendance in university classrooms, it is interesting to recall the expression of a somewhat similar opinion in sturdy Roger Ascham's "Scholemaster" (1563-8), written in the early years of Elizabeth's reign. Ascham, of course, wrote before many of our English classics had come into being; when, as yet, neither Spenser nor Shakespeare had produced anything. He was thoroughly versed in Greek and Latin literature—the test of scholarship in his time—as the "Scholemaster" amply testifies. The following passage, taken from "the second bookc teachyng the ready way to the Latin tong," contains his list of essential masterpieces, which, in view of his and Mr. Cheke's important connections with St. John's College, might be termed, by analogy, the Cambridge Classics:

> If a good student would bend him selfe to read diligently ouer Tullie (Cicero), and with him also at the same tyme, as diligently *Plato*, and *Xenophon*, with his bookes of Philosophie, *Isocrates*, and *Demosthenes*, with his orations, and *Aristotle* with his Rhetorickes: which fiue of all other, be those, whom *Tullie* best loued, and specially followed. . . . What perfite knowledge of both the tonges, what right and deepe judgement in all kinde of learnyng would follow, is scarse credible to be beleued.
>
> These bookes, be not many, nor long, nor rude in speach, nor meane in matter, but next the Maiestie of Gods holie word, most worthie for a man, the louer of learning and honestie, to spend his life in. Yea, I haue heard worthie *M. Cheke* many tymes say: I would haue a good student passe and iorney through all Authors both *Greke* and *Latin:* but he that will dwell in these few bookes onelie: first, in Gods holie Bible, and than ioyne with it, *Tullie* in *Latin, Plato, Aristotle: Xenophon: Isocrates:* and *Demosthenes* in *Greke:* must nedes proue an excellent man.

Dorothy Foster.

Literature.

CLEVELAND: AN INTIMATE VIEW.

Recollections of Grover Cleveland. By George F. Parker. New York: The Century Co. $3 net.

This book is properly named. There is a preliminary sketch of Cleveland's life before he became a national figure, and hardly any really important event of his career goes entirely unmentioned: but the book is not a biography. It is a *mémoire pour servir*—and a very good one. Every future biographer of Cleveland will be much indebted to it.

Mr. Parker's own recollections amply justify him in making the book. He prepared (in the White House) the "Democratic Campaign Text-Book" of 1888, collected and edited, with Cleveland's consent and coöperation, his "Writings and Speeches," and wrote the campaign "Life" of 1892. He knew Cleveland long and well, evidently enjoyed his confidence, and kept all along the note-taking habit of an old-fashioned editor. But his are not the only recollections the book contains. Others of Cleveland's friends have contributed to his store, and perhaps the most valuable of all are certain of Cleveland's own, given from time to time in conversation, dealing with some of the most interesting episodes of his career and with the best-known of his contemporaries. And yet, although thoroughly reminiscential, the book is not light and gossipy, or of a newspaper or magazine flavor, but a careful presentment of a great public character as seen by his intimates. Interesting as it is, considered merely as the revelation of a strong personality, it deserves to be treated as a contribution to history and a serious study of the personal factors in some extremely important political happenings.

The tone and attitude throughout is admiring, respectful, almost reverential; and possibly the book is open to criticism on the score of not being sufficiently critical. Cleveland is nowhere much dispraised, and seldom found seriously at fault. But the effect is not of adulation. There is no attempt to endow him with gifts and qualities he did not possess, or to invest him with any kind of sanctity. The defects in his equipment, due to his meagre education and the suddenness of his rise, are candidly dealt with. It is admitted, for instance, that he had not the art of managing and directing legislative bodies—although the admission is, to be true, coupled with the explanation that he never felt that to be a part of his business as an executive. His inability to get on with newspaper men is likewise confessed; but the description of his unbending independence in this regard sounds more like praise than blame:

> He would neither court any man, nor permit any man to court or flatter him, and this, of course, was the fundamental reason why, as a public man, he would have nothing to do with newspaper editors or proprietors. . . . He not only would not go out of his way to invite such men to luncheons or dinners or to social occasions, but he would not do so at all. If this method was suggested, he would reject such overtures with a positiveness that shortened many an interview.

And he quotes Cleveland himself as saying, late in life:

> I simply could not and would not use these methods to ingratiate myself with the editors or owners of newspapers. I realized fully the fate that I invited, but I looked upon my table or my parlor as my own, places reserved for my friends and for the congenial men whom they might send to me, and not proper means for bringing me support for public acts or policies.

Yet he admitted that such methods had become "accepted as a necessary way for moving public opinion." The unreasonable man did probably understand fairly well the game he declined to play! It is not improbable that with a little coaching he could even have been made to see the particular advantage of favoring the press with interviews and outgivings on Sunday, rather than any other day of the week.

This is by no means the only respect in which the old-fashioned quality of Cleveland's integrity is brought out in these pages, as in all the more intimate accounts of him we have. Sometimes one is moved to admit that it became sheer obstinacy, and a fault. For instance, he never learned to dictate to a stenographer with any facility, but wrote everything of importance with his own hand—a practice which, of course, kept him overworked at times when he needed to spare his strength. To have suffered since his day from a too-ready acceptance of stenographic aid to expression in the White House does not permit us to condone this neglect of labor-saving devices in a President who found composition difficult and considered it necessary to think before any kind of utterance. His method with state papers and public speeches was, in fact, extremely laborious. He not only, as a rule, made two or three drafts with his own hand, but he was too loath to accept help in any form more positive than mere criticism. Criticism he always sought, for he was painfully aware of his deficiencies of training as a writer; but he carried his independence so far that, as Mr. Parker puts it, "he must think himself original, whether he was or not," and would always "plug along," as he himself phrased it, in his "blun-

dering way," sometimes unconsciously absorbing suggestions which he had at first seemingly rejected. This kind of stubbornness was also, we must probably consider, a fault, and blameworthy. Indeed, his chief failing as a public man, as a fighter for great causes, lay, doubtless, in the very stiffness of his integrity, in his lack of suavity and agility, in his utter inability to be all things to all men—or, rather, to be either more or less than he was, or other than he was, to anybody.

But lest the stressing of this characteristic prove misleading, there should be set beside it another fact, which Mr. Parker makes clearer than any one else has ever made it; the fact, namely, that Cleveland was, by training as well as instinct, a far better politician than has been commonly supposed. He himself is quoted as saying:

> Before I reached my majority I had begun work in the capacity of what would now be called a practical politician. I had no aspiration to be a boss, even if either the word or the thing had then been known; but I only followed the custom of my time in taking my place at the polls and distributing ballots to all those who asked for them, using my influence to convince the wavering or to confirm those who belonged to my household of faith. . . . From 1858 until my election as Mayor, in 1881, I went to the polls, took my place, ballots in hand, as a voluntary helper to my party and its candidates.

And again:

> I have been amused, since I entered the larger public life, in 1882, at the spirit of patronage with which I have been treated by the so-called politicians. Somehow there seems to have been an impression that I was dealing with something I did not understand; but these men little knew how thoroughly I had been trained, and how I often laughed in my sleeve at their antics. From the beginning I never felt at a loss in dealing with them, because I knew that, back of the machinery with which they screened themselves, there was still a great and interested mass of people who did not wait for permission to form their opinions.

Cleveland's chief political gift and power lay precisely in his ability to reach and sway that "great and interested mass of people" which the machine men could not control, and his disregard and defiance of the machines may be considered as not merely an expression of his independence, but an essential feature of his political method. His was deep-sea fishing. The machine men thought him a poor politician, because his method was not theirs, because they did not understand him as he understood them. After praising, in the highest terms, William C. Whitney's work in 1892, in the fight for Cleveland's third nomination, Mr. Parker remarks that, although most of the effective "anti-snapper" moves of that year were accredited to Whitney, who, with all his ability "had the defects of the training incident to New York politics," most of them were, in fact, suggested by Cleveland himself. Through a prodigious personal correspondence, and through many "voluntary and intelligent agents," he kept in closer touch than any of his friends and advisers with the really controlling, because honest and independent, public opinion of the country. Again and again, when, contrary to his friends' advice, he took some bold and decided course, the event proved his judgment to have been better than theirs. It was so with his speech before the Boston Merchants' Association, in the autumn of 1888, which made the beginning of his recovery from defeat. It was so with the Ellery Anderson letter, against free silver, in 1891. It was so with his utter refusal to make any kind of terms with Croker. It was so, in the long run, with the single-topic message of 1887.

No contribution Mr. Parker makes to our understanding of Cleveland is more valuable than this; and no part of the book is better reading than the account of the preliminary campaign of 1892, of which Mr. Parker himself probably knew more than any other one man who had a part in it. He describes it thus:

> It was the oddest of campaigns. Its most curious and unusual feature was the comparative absence of men close to the party machine. In every State, except Massachusetts and Pennsylvania, our original correspondents and advisers were men not known in active management, either then or since. In many States, in fact in most, the machine was a persistent, often a malignant, enemy. If there ever was a movement which derived both its origin and its strength from the people, it was this one, with no organization behind it, or anything except the personality of a man who, having espoused an idea, thus made real appeal to popular sentiment.
>
> Nor was its conduct, so far as correspondence was concerned, anything like so difficult or intricate as might have been supposed. Letters were continually coming in to me, making report of local conditions in many States, but it must also be recalled that others were arriving in still greater numbers to Mr. Cleveland, and that these were common property. . . .
>
> . Once started, the movement ran itself, gathering momentum without concerted effort or central direction. Even the most efficient State boss, if the coöperation of such an one could have been imagined, would have been wholly lost in the overmastering, irresistible public sentiment to which it was early possible to make appeal. It was not only public sentiment to which appeal could be made, but by this time the most effective, because a thoroughly popular machine had been constructed—exclusively a Cleveland machine, having only the smallest connection with anything that was in existence at the close of the first term, or with the official organization of the party in even so much as one State.
>
> As this organization grew without the use of money, or the intervention of any recognized leader, new or old, or anything resembling routine or conscious management, it becomes, as an historical fact, as spontaneous, and in its final results and conduct—the management at headquarters in 1892—perhaps as artistic as any known to American experience. Its motive power was not new: it was merely the application to the country at large, on modified lines—though without money to sustain or promote it—of the methods so successfully employed in New York a few years earlier by Samuel J. Tilden. Without definite plans to be followed, it brought to the front the best men of the party, who, interested in politics, but more in a man and a cause, without personal ambitions of their own, did their work and passed off the political scene.

This was written of the earlier stages of the movement, before Mr. Whitney, on his return from Europe in the spring of 1892, put himself at the head of it. The account of it from that time on, in which all the chief actors are named and their parts described, is even more intensely interesting to the student of the politics of the period. There was the secret conference of leaders from all parts of the Union, except the Pacific Coast, at Mr. Whitney's house, on June 9, which blocked out the programme for the impending convention; the adjourned meeting at Hotel Richelieu, Chicago, on June 17; and the carrying through of the programme, in all essentials, under Whitney's masterly and masterful management, up to the final triumph when the roll was called in the early morning hours of June 23. It is an inspiring story, with its revelation of what can be accomplished by candid and intelligent patriotism under our party system as it is. One cannot help hoping, in spite of all the changes in the Democratic party since that day, that something of the same kind may yet again be accomplished within its lines.

To that hope Cleveland held with characteristic stubbornness. He believed in the party system, and his devotion to his own party was not less strong and sincere because it was also the high love that would not condone wanderings from principle. In what is perhaps the best letter in the book, written in March, 1908, to an old Democratic friend and comrade, E. Prentiss Bailey of the Utica *Herald*, he protested that he could still see light ahead for Democracy. Although he had for years thought Judge George Gray of Delaware the best man to lead the party, his hopes at that moment were centred on the lamented Gov. Johnson of Minnesota, behind whom the best element in the party seemed to be at last forming for some real resistance to Bryanism. "I do not want you to suppose," he wrote, "that a feeling of pessimism toward political affairs is habitual with me. On the contrary, such a condition of mind is quite infrequent and so temporary that it yields quickly to a better mood and a settled conviction that our party before many years will march from the darkness to the full light of

glorious achievement." He foresaw that, if Bryan were named again, the party would be in great danger of losing its "distinctive issue" of tariff reform. "If we fail this year," he said about the same time, "the Republicans will take up the question in such a way that we cannot hope to recover our ownership of it. That they will tinker with it, is certain. They have played with the currency problem, but, in doing so, have deprived us of power to appeal to the country on the large lines inherent in the principles for which our party has always stood." He saw, in fact, quite as clearly as any mind in the country, the entire drift of his party away from its right course, which is also its only really hopeful course. Since his hopefulness was coupled with such clear-sightedness, it may be taken as a good reason for hopefulness by such as to-day hold fast to the tenets for which he stood.

The chapters in which Mr. Parker sets forth what those tenets were, giving intelligently the main lines of Cleveland's political philosophy, constitute the soliest part of the book. They embrace his views on economic questions, particularly finance, taxation, and the regulation of public carriers; on the civil service and patronage; on party; on legislation in general, and on the courts; and one is again and again surprised to see how often he anticipates the sounder conclusions, while avoiding the errors and extravagances, of those who have ruled us since his day. His "blundering way" of studying public questions patiently and ploddingly, with directness and simplicity, brought him to astonishingly few blunders in the final expressions of opinion.

But, doubtless, the chapters given over to his judgments of his contemporaries will have, for most readers, a livelier interest. Such as may still persist in thinking him a man of ordinary or less than ordinary acuteness and perspicacity, raised by mere good luck above the heads of brighter men—once a not uncommon opinion—will find here yet other surprises. He seems to have been, for instance, about the first man in the country to perceive Mr. Roosevelt's ability and dexterity as a politician, and his overpowering ambition. So far was he from being governed, as was supposed, by a bitter antagonism to David B. Hill, that he praised and admired Hill's administration as Governor of New York and utterly repudiated the suspicion that he was guilty of treachery to the national ticket in 1888, Hill's success that year being due to causes which Cleveland thoroughly understood. Hill, on his part, remarked at the time to Alton B. Parker:

> This ends me as a Presidential candidate. . . . Nothing will ever convince the party that I was not to blame in some way, either direct or mysterious, for the result in this State which showed my election and the defeat of the Presidential ticket with Mr. Cleveland at its head.

Cleveland had a high admiration for Charles J. Folger, his unfortunate opponent for the Governorship in 1882, and with him, as with all his other opponents and rivals, utterly declined to employ, or to consent that others should employ, attacks of a personal nature. For Harrison also, he felt much admiration, praising particularly his judicial appointments, which he felt that he himself had been quite unable to match; and he liked McKinley. With certain of his associates in the great Democratic revival of his time, he formed ties of the strongest friendship—particularly with William L. Wilson, and Carlisle, and other members of his Cabinets, with George Gray, and with both the versatile and lovable John E. Russell, and the young and brilliant and clear-headed William E. Russell, of Massachusetts. The admiration and love which he and Thomas F. Bayard, rivals for the Democratic nomination in 1884, seon came to have for each other was, perhaps, the finest comradeship in all our political history. Each declared, years after the 1884 convention, his continued amazement at the idea of his being opposed as a rival to such a man as the other. But, perhaps, the best instance of Cleveland's clear vision concerning men, as well as politics, is a reflection on his own career. Says Mr. Parker:

> He often expressed the opinion that while men like himself, without experience or aspiration, who had been preferred for high places, were forced to overcome many hardships from lack of knowledge of the larger conditions, the type of men under discussion (men whose whole lives had been given to seeking office after office, with the Presidency as a goal) had become, as it were, *blasé* in politics, had formed so many connections all along the line of ascent, incurred obligations to so many sorts of people, and weakened themselves by so many intrigues and compromises, that they could seldom command a nomination, much less an election.

The single error of fact we have noticed is the statement that Cleveland's speech of acceptance in Madison Square Garden was his only public appearance in the campaign of 1892. Some weeks later, he addressed a convention of Democratic clubs in New York city.

There is an index, a chronology, and a negligible bibliography.

CURRENT FICTION.

Abaft the Funnel. By Rudyard Kipling. New York: B. W. Dodge & Co.

Actions and Reactions. By Rudyard Kipling. New York: Doubleday, Page & Co. Also published in the Outward Bound Edition of Chas. Scribner's Sons.

These two volumes, published almost at the same moment, enforce the contrast between the earlier and the later Kipling. The first is a gleaning of hitherto uncollected papers—stories and sketches—contributed to Anglo-Indian periodicals in the years 1888-1890; at the very hour, that is, when the name of a young journalist began to be heard round the world. The second contains the latest fiction and verse of a seasoned and successful writer, who has long been able to work deliberately and upon his own terms.

Inquiry reveals "Abaft the Funnel" to be what it seems, an exhumation of material which Kipling had doubtless reckoned safely buried in the files of the Allahabad *Pioneer* or elsewhere. The present publisher's claim of copyright, even, would seem to be idle, since Doubleday, Page & Co. are announcing their intention to print at once "a library book" made up of precisely the same stories—to be sold at a cut-throat price. Doubleday, Page & Co. regard the book as a piece of literary scavengering, but admit shyly, after announcing their own publication of the tales, that "several critics have given their opinion that they contain some very characteristic samples of Kipling's early work." They do. They contain the crude substance of the Kipling, who, in his young twenties, took the world by storm. The "Plain Tales" and the other early volumes were made up of precisely such stories as these—many of them written hastily as newspaper fillers.

But all that Kipling saw fit to put into book form underwent careful revision. The thirty papers collected under the title "Abaft the Funnel" stand as they originally came from his hurried pen. Most of them are sketches rather than tales, and of slight intrinsic value. There is an amusing skit called "Chatauquaed," the nature of which will be gathered from the title; and there are two Anglo-Indian tales "Sleipner, late Thurinda," in the vein of "The Phantom Rickshaw," and "A Supplementary Chapter," concerning Mrs. Hauksbee and Mrs. Mallowe. Finally, there is "The Last of the Stories," in which the world-weary author represents himself as interviewing, under the devil's ciceronage, the characters he has created—the chief persons in "Plain Tales from the Hills," "Soldiers Three," and "Under the Deodars," and bidding them a last farewell. This was written in 1888; Kipling was then in his twenty-fourth year. To those of his own generation, he was a vindicator of youth: we gloried in his swiftness, his energy, his insight, his cocksureness and aplomb. He was the prince of sophomores, and seemed to promise his subjects a final elimination from this world's affairs of all old-fogeydom and rot. He is a "lost leader" to them now. They have marked, alongside of that growing idealism which the Nobel prize-

givers were fain to recognize the other day, a steady indrawing and stiffening of attitude toward the world's practical affairs. They have not been able to follow him when he sounded the charge. He has wearied them a little with his enthusiasm for the Englishman as a divinely appointed Captain of the School.

And, of course, there have been changes in his art of writing during the past twenty years. The rough, swift force is gone, the youthful cynicism, and the journalistic dash. The "actions and reactions" of his latest volume would have been recorded by the young Kipling in a tenth the space here employed. They are the careful product of a responsible middle-aged practitioner. The manner of "An Habitation Enforced" is actually more like that of Mr. Howells than like that of the writer of "The Courting of Dinah Shadd." "Garm—a Hostage" takes us back to Simla, to an experience of Stanley Ortheris, and even to a glimpse of Mulvaney; but they move with the decorum of penitent ghosts borrowed from the limbo in which, twenty years ago, their creator promised they should be left in peace. "The Mother Hive" is a parable in the Jungle Book vein. "The House Surgeon" is a haunted-house story marked by the mature Kipling's subtler treatment of the supernatural. "A Deal in Cotton," "The Puzzler," and "Little Foxes" again reveal the Englishman bearing alone the white man's burden. There remains what is intrinsically the most remarkable story in the collection—representing an aspect of the later Kipling's imagination of which the young Anglo-Indian journalist made no sign—that *tour de force* of the technical fancy, "With the Night Mail."

Of the intercalary verses little need be said. Each of them is intended to enforce the moral of the preceding tale. Only in the last (inscrutably entitled "The Rabbi's Song") are there touches of poetry; and this is defaced by the cockney pairing of "water" and "quarter."

The Title Market. By Emily Post. New York: Dodd, Mead & Co.

The question of international marriage is one that seems irresistibly alluring to ladies with a bent for authorship—especially that form of international marriage that is signalized by the junction of a coronet with American millions. This theme, however, has definite limitations, and it is unavoidable that those who choose so narrow a way should tread more or less in the steps of their predecessors. Mrs. Post has given us an entertaining story made up of old materials—so old, indeed, that it requires no great experience of fiction to forecast the end from the beginning. Her character delineation lacks originality; the plutocratic papa as the god behind the scenes has been more powerfully drawn in "The Shuttle," and Nina shows somewhat pale and indeterminate after the masterful Betty. The real merit of the book lies in its graphic portrayal of life and manners among the higher social circles of Italy, with all the small discrepancies and oddities that strike so strongly the Ango-Saxon observer. The combination of ancient luxury and modern discomfort, half pathetic yet wholly humorous, is well touched in Prince Sansevero's pæan of joy, when he hears that his sulphur mine has become profitable, under the management of the American hero. Borne upon the exaltation of the moment, he promises his wife stoves, and emeralds set in a footstool, in the same breath. In spite of its happy moments, we close the book with a general sense of one superfluous volume the more.

Forty Minutes Late. By F. Hopkinson Smith. New York: Chas. Scribner's Sons.

Their gathering together under a common title and between the covers of a real book does not very much disguise the ephemerality of F. Hopkinson Smith's most recent tales. Mr. Smith is at home everywhere, and with all classes: he has this great advantage as a story-teller, just as he has the knack of picturesque expression, the aptitude for dialogue, the cleverness of limning features of men and women and places, that we call literary facility. All this hurts as well as helps. One is conscious, in reading "Forty Minutes Late," that Mr. Smith is a ready writer. One is tempted, perhaps for that very reason, to do him less than justice; so excessively easy does this novelist find surface characterization. And yet, in the proper mood, one can greatly appreciate the pleasantly rapid passage of the moments, to which this good-natured story-teller so generously contributes. The faults and the merits of Mr. Smith's short stories, at their average degree of both, are as the faults and merits of our monthly journalism of shilling quality. Here, as in earlier tales, he is at his best in telling of manly actions and derring do. That is why we are best pleased with his story of the ocean steamer whose engines failed her, but whose captain saved all hands—and the book before us.

Doctor Rast. By James Oppenheim. New York: Sturgis & Walton Co.

The tales which make up this volume represent one of the most successful types of magazine story. They have the primary advantage of dealing with a new field, or of dealing with an old field in a new way. We have had stories of the New York Ghetto written by outsiders concerned with the sociological aspect of the scene, and by insiders to whom Ghetto life is a racial or religious theme. Mr. Oppenheim has found in it a field of luxurious sentiment. His Ghetto is an abiding-place for Col. Newcomes and Little Nells, Paul Dombeys and Cosettes, a world benevolently ruled over by a certain young Jewish physician and his wife. These two love each other romantically, exuberantly, for the edification not only of their own four walls, but of an admiring public. But then everybody loves everybody else like that in Mr. Oppenheim's Ghetto: every sleeve wears its heart, and there are no daws to peck in that happy region. Dr. Rast goes about his work in a mist of torment or ecstasy under which a real physician could not stand up a month. He is a Samaritan rather than a physicker, and a Samaritan perennially confounded by the suffering to which he ministers, perennially moved to tears by the beauty and triumph of human life as he sees it:

> He turned. He went out. He stole down the dark steps. Nell was waiting for him.
> "Morris," she cried, "are you all right?"
> He gathered her in—tenderly, tenderly.
> "Oh, Nell," he breathed, "human beings—human beings—I love them!"

The critic who should attempt to stare this popular literature of sensibility out of countenance, would no doubt be over-rating his own powers. And we have at least outgrown Wertherism. If we yet have tears for Sterne's donkey, or Dickens's Tiny Tim, they may be admitted to serve a softening, if somewhat enervating purpose. Enervation is not foremost among present-day perils.

TWO BOOKS ON SICILY.

Sicily, the Garden of the Mediterranean. By Will S. Monroe. 48 plates. Boston: L. C. Page & Co. $3.

Seekers in Sicily: Being a Quest for Persephone by Jane and Peripatetica. Done into the Vernacular by Elizabeth Bisland and Anne Hoyt. New York: John Lane Co. 8 plates. $1.50 net.

These two books may serve as the extreme types of their class. Mr. Monroe is concerned with facts, Mesdames Bisland and Hoyt deal frankly in fancies after the fashion *longo intervallo* of Laurence Sterne. Mr. Monroe presents useful information, drawing freely and with discretion from approved sources. He evidently knows his Sicily at first hand, but, in the main, he keeps to the modest rôle of compiler. His chapters are chiefly historical, but he discusses as well politics, agriculture, the Mafia, the Messina earthquake, education, arts, and letters—in a word, all the principal topics of current interest. In no sense a guide-book, it will serve to fill out Baedeker's excessively skeletonized treatment of Sicily.

This is not to accord Mr. Monroe infallibility. His book has the general de-

fects of its class. He calls sirocco—a wind the curse of which is its humidity—a *dry* wind. Theocritus becomes the founder of "lyric" (read pastoral) poetry. That the Sicilian dialect differs less than the others from standard Italian (p. 216) is emphatically not true. Mr. Monroe has apparently taken up unadvisedly some statement as to the old, artificial Sicilian poetry of Frederick II's time. That the Venus Landolina of Syracuse is one of the four most beautiful statues of the goddess is most disputable. The better criticism, we believe, regards this marble as Greco-Roman, and of no very high quality. To say of Antonello Gagini (whose name is occasionally misprinted as "Gagni") that "after Michelangelo he is generally regarded as the first sculptor of Italy," is news indeed—an estimate adapted to the longitude of Palermo. Mr. Monroe's brief account of the Messina earthquake is misleading in several regards. At Messina there was no tidal wave of consequence, except as the wrecking of small boats seriously hampered the work of relief. The wave that swept miles inland devastated the opposite, Calabrian shore. All of the cathedral treasure was saved, and practically the entire contents of its museum—including, strange to say, its famous majolica—were recovered through the efforts of Professor Salinas. To the credit of Italy it should be recorded that before the Russians and English came, the officers and crews of the torpedo-boat flotilla in harbor worked heroically with the scantiest resources. These are trifling blemishes in a work generally accurate and useful. For a lack of literary distinction no one need criticise Mr. Monroe. He effects what he sets out to do—a sober, well-balanced survey of a complicated subject.

As to the book of the "Seekers"—the reader is plainly warned off or sped on by the sub-title. It is the usual combination of random and inaccurate information by way of crumb, with abundant facetiousness, sentimentality, or simple talky-talk by way of plums. Jane and Peripatetica are so continuously vivacious, so startlingly literary throughout, that one reader at least finds what they call their "word braiding" quite unnegotiable. To point out the numerous inaccuracies and occasional impossibilities in the descriptions, to mend the printing of the nondescript Italian sprinkled through the pages, would be a useless labor. To ask who are the "Sikilians" were ungracious. To opine that the ascent of Monte Venere on donkey back is not a harrowing adventure would be sheer pedantry. Enough that it harrowed our gentle questers. From his foot you may know Hercules, and we think that the smallest sample of this book will either incite the reader or, as it may be, put him warily on his guard. On the evening when Peripatetica suggested a spring trip to Sicily, Jane looked like "a mere diaphanous mauve cloud, from which the glimmering fire picked out glittering points here and there. When Jane takes to teagowns, she is really very dressy." Everything had for the Seekers this same penumbral purple quality, which has, no doubt, admirers.

Vorlesungen und Abhandlungen von Ludwig Traube. Herausgegeben von Franz Boll. Erster Band, Zur Paläographie und Handschriftenkunde. Herausgegeben von Paul Lehmann. Munich: Beck.

With commendable promptness the literary executors of Ludwig Traube have begun the publication of his remains. Traube's life was short, but of his forty-six years, almost every one since his seventeenth saw the issue of reviews, articles, or books of the highest quality, and even to the list in the present volume one addition must be made, the "Paläographische Bemerkungen," published posthumously in A. E. Burn's "Facsimiles of the Creeds in Early English Manuscripts," 1909. While many of Traube's writings are concerned with details, details were meaningless to him unless they contributed to larger relations. He enlivened old facts, and constantly discovered new ones, but his deepest interest was in far-reaching designs, which he did not live to complete. How great a monument he might have built we see in the volume before us. Besides the list of Traube's published works, running to 153 titles, there is given a list of fifty-seven subjects to which he had devoted research, accumulating his notes in special portfolios. Some of these studies were well-nigh ready for publication, and will now appear in successive volumes, under the general editorship of Professor Boll.

Traube's greatest achievements were doubtless in palæography. He was a born bibliographer, and no man living was better qualified than he to write a history of Latin literature in the Middle Ages; but precisely because he recognized and, in fact, made the cornerstone of his method, the interdependence of mediæval history and palæography, was he led more and more to the latter subject, with which, from this larger point of view, so little had been done. Palæography, he would explain in his lectures, which are printed in the present volume, is the history not only of the script, but of the book that contained the script, and of the monastic library that contained the book. He could show that historical problems like the Adoptionist controversy and the state of culture in Ireland during the early Middle Ages, depended on palæography, in part, for their solution. He always appealed to the general ideas surrounding his subject; in tracing the development of palæography as a science, he did not, like the routine lecturer, reduce it to bibliographical lists, but embedded it in human history. The hearer felt that he was following the story of great events, and was not surprised that it was illustrated by quotations from Goethe, Montaigne, Lessing, Leopardi, or by reference to Descartes, Richard Simon, Darwin—this with no suggestion of the purple patch, but with immediate bearing upon the argument. One was inspired with his devotion to the founders of the science, those great eccelesiastics Mabillon and Montfaucon, and felt the title he gave them, ἥρωες ἐπώνυμοι, not extravagant. Traube singled out only three German scholars as deserving the title of great palæographers. The scholarly world will add his name to the list, regarding him not merely as a great palæographer, but as practically the founder of a new science.

Most noteworthy among the many problems that Traube raised and to the solution of which he greatly contributed, is the origin of the abbreviations in mediæval script. His last work, "Nomina Sacra," sets forth his complete results. His general conclusions are sketched entertainingly in an address delivered before the Bavarian Academy of Sciences, and included in the present volume. The system that gained the day in the Middle Ages was contraction; that is, the omission of certain letters in the body of a word, as *dns* (with a stroke above), for *dominus;* it originated, Traube shows, in manuscripts of ecclesiastical works. Suspension, the curtailing of the latter part of a word, as *dom* (followed by a point), for *dominus*, was the earlier system, employed in pagan documents and inscriptions, and appearing likewise in literary works, both pagan and Christian, but, like the stenographic abbreviations of the Tironian notes and other systems, it passed eventually into disuse. Now, the earliest contractions, Traube shows, are found only in manuscript of ecclesiastical works, and these are restricted to certain sacred names, such as *deus, Iesus, spiritus*, a device evidently suggested by the similar abbreviation of sacred names in manuscript of Greek works. Traube argues, plausibly, that the practice owed its origin there to the use of the Hebrew tetragram for the divine name, naturally without vowels, in texts of the Septuagint. So the original purpose in omitting letters from the sacred names was not to abbreviate, but to honor them with a special symbol. Abbreviation was a by-product, like the Phœnicians' discovery of glass, observes Traube, and proved a most useful one. It is a pity that Prof. W. M. Lindsay, in his recent brochure on "Contractions in Early Latin Minuscule Manuscripts,"

which supplements Traube's "Nomina Sacra" with useful collections of examples, should throw the whole subject into confusion again by abandoning the distinction between contraction and suspension, that plays so vital a part in Traube's discussion.

It is right, then, that the first volume of these posthumous publications should be devoted to palæography. It contains, besides the matter already referred to, a valuable list of extant capital and uncial manuscript compiled by Dr. Lehmann, who in all ways shows himself a most competent editor. Prof. Boll adds, by way of preface, the best biographical sketch of Traube that has yet appeared. The character of such a man, who was not only a brilliant and penetrating discoverer, but a great humanist, is an answer to certain critics of specialization to-day; for the real specialist, like Traube, is a real Platonist, a follower of the many and of the one.

The Conquest of the Isthmus. By Hugh C. Weir. New York: G. P. Putnam's Sons. $2 net.

The library of Panama literature, already filling more than a five-foot shelf, is extended by the addition of a lively volume of sketches of life and work on the Canal Zone by Hugh C. Weir. He does not concern himself with the difficult questions of engineering and finance, except to join in the chorus of condemnation of the unpatriotic "muck-raker," but overwhelms us with figures, showing the greatness of our achievement, and dazzles us with the contrast between the little streak of Americanism and the untracked jungle on each side. He goes alligator shooting with Capt. Shanton in a chapter compact of thrills and excitement, and in the same spirit of adventure he visits the Christmas bazaar of the Woman's Club at Ancon. He goes through the Culebra Cut on a motor car and barely escapes being crushed by a twenty-ton boulder. This is in the forenoon. In the afternoon he comes "within three inches of death" from the sting of a deadly black scorpion, against which "there is absolutely no antidote." He stands upon Gold Hill at Culebra, "with the memories of my Prescott sharply astir," and his imagination fires at the thought that here Balboa stood and gazed at the Pacific. This is a favorite joke with the men of the Canal, although usually it is Paraiso Hill that they palm off on the tenderfoot as "Balboa's Cliff." As a matter of fact, it was a peak in Darien, about a hundred miles away, from which the southern ocean was first seen; Keats got the place right if he did get the name wrong.

Mr. Weir administers his statistics in the most palatable manner, and he grows eloquent over the heroism and energy of the men who make the dirt fly. The book will serve a useful purpose in impressing the average reader with the magnitude of this national enterprise in its varied aspects. It is undeniably superficial and sensational, and its statements are not to be accepted without caution. Sometimes, an over-hasty snatch at an idea results in an amusing misconception like the following: "Quinine, one of the most beneficial drugs to man that has ever been discovered, is absolutely fatal to the mosquito." The picture this calls up of Col. Gorgas and his men going about dosing the anopheles with quinine, presumably in the ten-grain capsules, gives a new view of the sanitary question. As Mr. Weir is eager to represent the Isthmus as a most healthful and pleasant place of residence, it is unfortunate that he exaggerates its heat. He says the average temperature is 110 degrees. It is really about 80 degrees, and the Panamanians boast, not with entire truthfulness, that the thermometer never rises to 100.

The Wars of Religion in France, 1559-1576: The Huguenots, Catherine de Medici, and Philip II. By James Westfall Thompson, Ph.D. The University of Chicago Press. $4.50 net.

Not many periods of European history so interesting and important as the epoch of religious wars in France are so slightly represented in recent English historical writing. The decade from 1879 to 1889 saw the appearance of a number of works in this field: Baird's "Huguenots," Armstrong's "French Wars of Religion," and such books as Jackson's "Last of the Valois." But though Continental scholars during the last twenty years have quite changed the conception of this period, the results of their investigations until now have found comparatively slight reflection in English. This is the more surprising in that this favorite field of romance has not only profound religious, diplomatic, and economic importance, but has also direct bearing on affairs across the Channel. But it is an old story that interest in a particular line of work comes and goes, often without apparent cause, and even at times seems to move in definite cycles.

Certainly, few periods offer more of interest than the years covered in this study. The genius of Dumas has made most readers familiar with many of the more remarkable characters and incidents of a time rich in both. The figures of the last Valois kings, the Guises, the Chatillons, and the Bourbons, of Catherine de' Medici, of Mary Stuart and Philip II, of the lesser lights like Tavannes and Montluc, La Noue, and Montgomery, with their tortuous intrigues, their romantic adventures, and their tragic ends, have irresistible fascination for the lovers of romance. Here, too, the champions of two great schools of religious thought have found a fair field for their controversial powers. Perhaps, in a sense, both of these circumstances have hindered a proper conception of the period. The personal interest in the career and fate of individuals has been so intense that the broad and deep currents of thought and affairs have been relatively neglected; or, if these have been considered, the passions roused then and since by the religious questions have not been favorable to the impartial investigation and presentation of truth. Now, at last, scholarship, turning aside somewhat not merely from the drum and trumpet, but from the weariness of diplomatic intrigue, has set itself to unravel the mysteries of economic conditions, of administrative detail, of political organization and practice.

In no small measure this is the value of the present work. Using the results of recent scholarship along the lines of economic and administrative, as well as personal and diplomatic investigation, Professor Thompson has produced an account of this tempestuous period in many ways radically different from the older conception. Nothing shows this difference more clearly than his treatment of military operations. The effect of the various forces, Huguenot, Catholic, German reiters, and Swiss mercenaries on the people—this he describes in detail. To be sure, he gives full-page plans of the principal battles; but it requires courage to break with immemorial tradition so far as to dismiss Jarnac with these words:

> The royal army under the nominal command of the Duke of Anjou, but really commanded by the veteran Tavannes, who had orders to give battle at all cost before the Duke of Deuxponts could arrive, won the decisive victory of Jarnac on March 13, 1569. It was a fierce and bloody battle.

Such a description has this advantage, at least: it leaves space to consider the effect on the people and on the situation of affairs. Moreover, in such treatment as he has given the period the leaders play their parts, not as a group of actors dealing only with each other, but in relation to their followers, to the nation as a whole. They become, therefore, more human and comprehensible, less like figures of tragedy moved by more than human motives and passions. Much glamour is thus removed, much mystery of state destroyed, and the illusion of romance gives place to the reality of life, with its sober play of cause and effect. We can still trace the devious ways of Medicean and Spanish intrigue, we feel the romantic interest of the Guise ambitions, the adventures of the viscounts; but we realize also the deeper forces at work, the extortion and maladministration of government, the oppression and discontent of the lower classes, the ruin of the peasantry, the depression of the workers by the break-

down of the guilds. And we can see in this disintegration of an old society those great social and economic changes which, scarcely less than the new religious ideas, made Protestantism a force in affairs of state and church alike. From such a study we may understand, as otherwise we cannot, not merely the Reformation, but the underlying forces which later were to make the Revolution and modern France.

In the main Professor Thompson has told his story well. The style, which is inclined to drag in the beginning, becomes clearer and more fluent as the narrative progresses. Throughout his impartiality is everywhere evident, and the dispassionate air with which he awards praise and blame, even in such affairs as the Massacre of St. Bartholomew, is a striking feature of his work. One might almost wish at times for more fire. His references are unusually full, and it is apparent from them that he has gone deeply into his subject. In particular he has relied largely on the Calendars of State Papers, Foreign, which in this period are remarkably full and valuable, as are those of the Venetian archives, upon which he also draws heavily. Many contemporary illustrations, maps, and plans add to the value of his work, and an excellent index with a considerable body of material in appendices contributes to its usefulness.

Notes.

Henry Frowde announces the early publication of "The Union of South Africa," by the Hon. R. H. Brand, secretary to the Transvaal Delegates at the South African National Convention.

Hodder & Stoughton will issue this autumn a "primer" to the novels of George Meredith, by Dr. James Moffatt.

S. R. Gardiner's "History of the Commonwealth and Protectorate," uncompleted at his death, is to be continued to a conclusion by Prof. C. H. Firth in the latter's "Last Years of the Protectorate, 1656-8." This work Longmans, Green, & Co. will issue in two volumes, this month or next. It will begin with the meeting of Cromwell's second Parliament in the autumn of 1656.

The wide and newly kindled interest in Spain which we have to-day will soon be rewarded by the issue through Houghton Mifflin Co. of Philip S. Marden's "Travels in Spain." Here is the story of a springtime journey from Gibraltar across the Peninsula, with a light but informed touching upon the Spanish arts and history.

At the time of his death, Walter Headlam was busy with a prose translation of Æschylus, and had completed five of the seven plays. C. E. S. Headlam has now translated the remaining two plays, and has written an introduction to the complete volume, which is to be added to Bohn's Classical Library by the Messrs. Bell.

The same publishers will soon issue two new volumes in their Masters of Literature series: "Defoe," edited by John Masefield, and "Carlyle," by A. W. Evans. They have in press a volume dealing with Thackeray, by G. K. Chesterton, which will be added to the same series; and will follow this with the "Emerson" of G. H. Perris.

Commander R. E. Peary's narrative of his successful Polar expedition is to appear serially in *Hampton's Magazine*. In book form, it will be issued through Frederick A. Stokes Co. This arrangement is the climax of a sensational series of negotiations. When the news of Peary's achievement reached New York, representatives of several publishers hastened to meet him. One of these reached Battle Harbor in time to assist the explorer in receiving the representatives of the press. In spite of the excitement on every hand, however, Commander Peary was unhurried in his publishing arrangements. In the end, he gave his book to the publishers of his earlier narratives.

It is good news that the brilliant essays of Oscar Wilde, gathered together under the title "Intentions," are to be made accessible, through their republication by Methuen & Co. (London).

The eighteenth century is still the subject of numberless reprints and reassemblages of old material: occasionally, too, of books which throw fresh light on men and things. "Intimate Society Letters of the Eighteenth Century," by the Duke of Argyle, is one of the volumes promised for early publication by Stanley Paul & Co. (London), newcomers in the publishing field; and Constable has nearly ready "Hogarth's London," by H. B. Wheatley, the well-known London topographer.

John Murray (London) will publish this autumn "The Correspondence of Priscilla, Countess of Westmorland" which her daughter, Lady Rose Weigall, has edited. Lady Westmorland was one of the most charming women of her time. As Lady Burgshersh she made, in 1814, a daring tour of Europe, following in the wake of the allies to Paris, and seeing the infinite havoc and chaos wrought to and by the army of Napoleon. Her diary, recounting these experiences, was published sixteen years ago. Later in life she went with her husband, who served as British ambassador, to Florence, Berlin, and Vienna.

Collectors of "The Compleat Angler" have now another edition to seek, and those brutish souls who have not loved Walton's charming pastoral have another allurement to love:

> Cras amet qui nunquam amavit, quique amavit cras amet.

Houghton Mifflin Co. has issued the first part of the work (*i. e.* Walton's part) as one of their special Riverside editions, on hand-made paper, with wood-blocks engraved by M. Lamont Brown, after the cuts of fish in the original. The book is small enough in size for the fisherman's or the "contemplative man's" roomy pocket, and it has every attraction which we have come to expect from the printing done under the supervision of Bruce Rogers.

We are inclined to name George Hodges's "Garden of Eden" (Houghton Mifflin Co.) as the vulgarest production of the press this year. It is an attempt to rewrite for the comprehension of children a number of stories from the first nine books of the Old Testament; the result is a translation of biblical language into a kind of smart "journalese" (with incongruous relics of the original intermixed) which it is not good for any child's ear to hear, and a transiation of biblical miracles into commonplace absurdities which are an insult to any child's imagination and understanding. As an example, a mild one, of Dean Hodges's jaunty style, we may quote his version of Moses on Sinai:

> "God told me that He would speak to us in that place. I am going up to meet Him." And he took with him a young man named Joshua.
>
> "You wait," he said to the people, "till I come back and tell you what God says."

As an example of his rationalizing we may refer to the account of the passage of the Red Sea, which changes the marvellous to the pseudo-scientific action of wind and cloud and water. Dean Hodges has a surprising knowledge of things which may never have happened at all. We have given space to this criticism of a poor book because it is handsomely printed and illustrated, in a manner to attract unsuspecting buyers.

In dealing with the first two volumes of Prof. J. E. Spingarn's "Critical Essays of the Seventeenth Century" (the *Nation*, June 18, 1908), we called attention to the excellence of the editing and solid erudition of the introduction. The third volume, now before us, gives no occasion to withdraw any word of that commendation. Though, perhaps, the essays in this volume as a whole are more even in quality, due to the growing consciousness of literary procedure, they contain nothing so fundamentally interesting as the work of Jonson or Bacon or Hobbes in the earlier issue. Yet we have here hints of the great quarrel of the ancients and the moderns in the essays of Sir William Temple, and the beginning of the bitter attack on the Restoration stage in the work of Jeremy Collier. Even more interesting is William Congreve's discussion of the nature of "humors," which introduces us to one of the great topics of English letters. We get a glimpse far backward and forward in his remark "that there is more of humor in our English comic writers than in any others. . . . And what appears to me to be the reason of it is the greater freedom, privilege, and liberty which the common people of England enjoy." The same remark is made later by Horace Walpole. In a note to John Dennis's "Impartial Critic," Professor Spingarn observes that "only one or two of Dennis's critical essays have been reprinted since that date [when Johnson said that "he wished to see John Dennis's 'Critical Works' collected"]; and the larger task remains undone, but still worth doing." Very well worth doing, we think; and Professor Spingarn would confer a favor on scholars by undertaking the task. It remains only to say that the notes of the present volume show the same accuracy and care as do those to the two earlier volumes.

Dumas may be tasted by English and American readers, not as romancer alone, but also as the writer of "My Memoirs" (The Macmillan Co.), and the same publishers now issue the supplementary volume, "Mes Bêtes," newly translated, as "My Pets," by Alfred Allinson. With sixteen

vivacious drawings by V. Lecomte, this last book makes a most attractive volume of three hundred pages; and one of the few works of the novelist which may be starred *pour la jeunesse*. Each of the chapters is lighted up by the sunny humor of the romancer, who, in his life, whether in Paris or, as here, "in my solitude at Monte Cristo," was as extravagant as in his wildest tales. The account of Dumas's rural life is singularly amusing. "I love solitude," he writes. "For those who can appreciate the charms, solitude is the most loving of mistresses. . . . Society is the distraction of the body; love the occupation of the heart; solitude the religion of the soul." But Dumas loved no lonely solitude, nor even a *solitude à deux*, save at rare intervals. He was surrounded, in town or villeggiature, by friends—colleagues—collaborators—servants—parasites; this from first to last. But in the book before us it is his animal comrades in which he is most deeply interested; and most deeply interests his readers. Dogs there are in greatest abundance; dog heroes and dog rogues, romantic dogs and dogs picaresque. The cats, Mysouff I and Mysouff II, interest us less; so, too, the residents of the aviary, eaten up by one of the Mysouffs, we forget just which; a green monkey or two and a blue macaw communicate an exotic touch. But enough of enumeration. Dumas's pets were at least numerous and amusing Their history is not to be read straight off, cover to cover, notwithstanding the entertaining style of it. Three hundred pages of anecdote are not to be bolted. But where could one ever find for the country house book-shelf (no matter how many feet to it) a better book than "My Pets"?

"Hints on House Furnishing," by W. Shaw Sparrow (John Lane Co.), is a diffuse and chatty book, but for that reason calculated to beguile the British householders, to whom primarily it is directed. After a general introduction on various methods of furnishing, on taste, color, and the English tradition, there are specific chapters on the treatment of walls, floors, ceilings, and finally on furniture and fittings. It is a practical book, even to giving the addresses of firms—in London, naturally. In general Mr. Sparrow is a safe and genial guide. He is ingenious in his method of teaching. For example, the cardinal points in righteousness of color are drawn from Titian's Bacchus and Ariadne. In his condemnation of speculative building and of dealer-made fashions in decoration the author attacks evils quite as glaring here as in England. In his passion for sound and simple construction, in his dislike of naturalistic design, and his offishness towards overtly patterned hangings and carpets, he is distinctly on the side of the angels. Idiosyncrasy perforce affects a book of this sort. Few, perhaps, will share his antipathy to the pale greens, most useful colors when the setting is right. Again, does every wall require a frieze, and is it all the better for a dado? We think not. It all depends upon the use of the wall, whether it is to be a composition in itself, or a mere background for a composition made up of pictures and furniture. Mr. Sparrow nowhere sufficiently sets forth the merits of tinted plaster, preferably roughcast, as a wall finish. It is difficult to get it done well, but few textures are more permanently satisfactory. Combed paint, too, has its appeal, but here we trench on plutocratic territory, and the book is for the reasonably well-to-do. The volume is well illustrated with typical English interiors, the usefulness of which to American householders is limited. Still, the doctrine is the thing, and since the book makes for rational taste we wish it a wide reading.

S. G. Tallentyre's "Life of Mirabeau" (Moffat, Yard & Co.) is a very inferior book to that of Professor Fling on the same subject, which we reviewed favorably twelve months ago. It is far less learned, and much more pretentious. It adds nothing to our knowledge of the subject, whether by way of new facts, or of new points of view. It echoes throughout the notes of Macaulay and Carlyle, and the style is after the manner of the latter.

Dr. Arthur C. Boggess's account of early Illinois ("The Settlement of Illinois, 1778 to 1830," Vol. V, Collection of the Chicago Historical Society) is the record of the narrow poverty out of which came abundance, of the chaos out of which came organization, in short, the record of the small beginnings of a great American commonwealth. The description is minute: forty-five closely printed pages contain the list of the authorities used. Its accuracy is vouched for by Prof. Frederick J. Turner and J. B. McMaster, who critically read the work before publication. The book will have small attraction for those who read merely for pleasure. The sober student, however, will find here the bases of Illinois's history clearly and fully discussed.

Whoever has wandered through the streets and parks of Weimar, and tried to call back, in imagination, the magic past when Goethe and Schiller and Frau von Stein and Karl August and his court made merry in the little principality, will find delight in Thea and Horst von Harbou's beautiful books, "Weimar: Ein Sommertagstraum," "Tiefurt: Aus den Memoiren eines Sonnenstrahls," and "Belvedere: In einer Vollmondnacht" (Weimar: R. Buchmann). These three unique *Märchendichtungen* of the Saxon Athens are accompanied by some fifty-seven illustrations made especially for the work. The verse runs smoothly and reflects a passionate interest in the traditions treated; and the extraordinary grouping of many persons in the costumes of Weimar's Biedermann days—fair maidens at the usually deserted summer houses in the woods, and tea-parties on the green where Schröter and the others once danced—gives these volumes an unusual attractiveness.

The latest addition to the series called Der Alte Orient, and published by J. C. Hinrichs, of Leipzig, for the *Vorderasiatische Gesellschaft*, is a brochure by Prof. Hugo Winckler of Berlin, entitled "Das Vorgebirge am Nahr-el-Kelb und seine Denkmäler." It contains also one chart and four illustrations.

Adolf Müller's "Der Galilei-Prozess (1632-1633) nach Ursprung, Verlauf und Folgen" (Freiburg in Breisgau: Herder) may be regarded as a continuation of his "Galileo und das kopernikanische Weltsystem" published only a few months ago. The author is professor of astronomy and mathematics in the Gregorian University and director of the observatory on the Janiculum in Rome. He also belongs to the order of the Jesuits, who were the most eager and energetic opponents and persecutors of Galileo, and the chief purpose of these two volumes is to justify their action. As the Copernican conception of the solar system had not yet been proved, Professor Müller maintains that the adversaries of Galileo were right in rejecting and denouncing a cosmogony which was still only a questionable hypothesis. We cannot here follow Professor Müller's argument in all its sinuosities; enough that his reasoning is wholly fallacious.

Dr. William Torrey Harris, former United States commissioner of education, died at Providence, R. I., November 5. His work as an educator had gained him an international reputation. Long before his appointment by President Harrison he had impressed the educational methods of the country by introducing into the public school system of St. Louis the first successful course of nature study in the country. He was one of the men who gave kindergarten work its foothold in the public schools, and as founder of the School of Philosophy he did much to stimulate metaphysical study in America. He was also a lover of the classics, and was especially fond of mediæval Latin hymns. He had few equals in familiarity with Oriental languages, literature, and customs. His versatility as a scholar is partly suggested by the fact that, while he was regarded as one of the two greatest contemporary exponents of Hegel, and as a keen critic of modern economic thought, he kept in touch with the latest developments in both experimental and pure science, and was a sound critic of architecture, sculpture, painting, and music. Born in 1835, he was a student at Yale College, and held several degrees of that and other institutions, but was never graduated. The honorary title of "Officer of the Academy" was decreed to Dr. Harris by the French government in 1878 for his school reports on exhibition at the great exposition, and in 1889 he received the title of "Officer of Public Instruction" from the same government. In his connection with the American Social Science Association he wrote many papers delivered before that organization. He was also a member of the Washington Academy of Sciences, and of the American Philosophical Association. He was a beneficiary of the Carnegie Foundation, being the first man so recognized. His death came at the completion of a new edition of Webster's International Dictionary, of which he was editor-in-chief. He also established at St. Louis, in 1867, the *Journal of Speculative Philosophy*, which he conducted up to the time of his death, was the editor of various school texts, and edited the department of philosophy in Johnson's Encyclopædia, for which he prepared many important articles. He was the author of "Introduction to the Study of Philosophy," 1889; "The Spiritual Sense of Dante's Divina Commedia," 1889; "Hegel's Logic, a Book on the Genesis of the Categories of the Mind," 1890, and of the "Psychologic Foundation of Education," 1898.

Baron Fernand de Schickler, one of the leaders of French Protestantism, and a well-known philantropist, has died at the age of seventy-four years. He was the author of many articles published in various periodicals, and of several extended works, of which the chief is his monumental his-

tory of the "Eglises du refuge en Angleterre."

Science.

The Kea, a New Zealand Problem. By George R. Marriner. Christchurch, New Zealand: Marriner Bros. & Co.

Several books have been published devoted to a single species of bird—one to the great auk, another to the passenger pigeon. Now we have a volume treating of a single species of parrot. The kea or mountain parrot has become a very serious problem to the sheep raisers of New Zealand. We know that parrots are not distantly related to owls and in this instance there seems to have occurred a slipping back from a vegetarian to a carnivorous diet.

For more than fifty years a few individual keas in the various sheep districts have led attacks on these animals, killing from five to fifty per cent. of the flocks. They seem to kill for the love of killing, long after their appetites are satiated. Winter, when other food is scarce, is the season of carnage; and at this time one or more birds will alight on the back of a sheep and begin tearing at the wool. In spite of every effort which the sheep may make, it ultimately succumbs, and the unnatural parrots feast on the kidney fat and other portions of the animal.

Mr. Marriner has treated his subject thoroughly, reviewing it from every standpoint. He has incorporated in his book information derived from many correspondents, and offers a pleasant account of the kea country. This is the most picturesque part of New Zealand—among the rocky crags and fiords, the gorges and snow-clad peaks of the high, rugged mountains. Such a region is not adapted to agriculture, but herds of sheep thrive here, and thus the kea finds its prey ready to hand. It nests in a rocky hollow or burrows six feet deep under ground, lays four white eggs, and the young are hatched in the depths of winter. The kea, in its love of play, mischievous ways, and uncontrollable curiosity, brings to mind the Canada jay or moosebird. In districts where it is not hunted, it will often alight, not only on or in one's tent, but even on one's back as one leans over to pick up something.

After giving a detailed account of the ecology of the bird, the author proceeds to its relation to man. All the early records of sheep killing are narrated; the probable cause which led to its change of habits is discussed; the time and method of attack, the damage done, and the methods used in kea hunting are described. One learns that, although thousands of pounds have been paid in bounties for kea heads, at the rate of two shillings each, the problem is one that must be met and fought continually. Two points of unusual interest strike the casual reader: the remarkable fact of a member of the parrot family living and nesting amid Antarctic cold and snow, and the almost unique instance of a native bird developing into a pest, whereas in almost all other recorded cases it is an imported species (as the English sparrow) which acquires inimical tendencies.

Blackie & Sons (London) announce the publication of a book on palæobotany, or fossil botany, by Miss M. C. Stopes, D.Sc., Ph.D., F.L.S., lecturer on fossil botany at Manchester University, under the title: "Ancient Plants." The work is written with the double purpose of introducing the general reader to this fascinating branch of science and of presenting a general survey of the whole subject in its latest developments.

A marble monument to the memory of Prof. P. Tillaux has been erected in the garden of the amphitheatre of anatomy of the hospitals of Paris. This monument was the last work of the sculptor Chaplain.

Julian S. Huxley, B.A., late scholar of Balliol College, Oxford, and gainer of the Newdigate prize for English verse in 1908, has been elected to the biological scholarship at Naples. He is a grandson of the late Professor Huxley.

There is great need for a comprehensive work on timbers and cabinet woods which shall give in convenient form the recent results of the microscopic, chemical, and mechanical studies of woods. A good many attempts have been made to supply this want, but no satisfactory work has yet appeared. In the latest of these attempts, a work entitled "Timber" (New York: D. Van Nostrand Co.), J. R. Baterden has undertaken to give in small compass a vast amount of information. Owing to the limitations of space he has, however, failed to present enough in regard to any one point to make the whole of great use to students or practical mechanics. Nevertheless, this is an interesting volume; well arranged, and capable of forming the basis, if properly built upon, of a much needed cyclopædia. The author has an excellent sense of proportion, and is evidently a thorough student. It would be safe for a publisher to entrust to him the preparation of an exhaustive work with copious references to original authorities and with the reference tables which every scientific student of timber needs to have at hand.

From Eskbank, near Edinburgh, comes news of the death of David Thomson, the horticulturist, at the age of eighty-six. He was for some time editor of the *Gardener* and was the author of a "Handy Book of the Flower Garden."

From Japan is reported the death of Dr. Kakichi Mitsukuri, dean of the College of Science in the Imperial University of Tokio, in his fifty-second year. A leader of modern Japanese thought, he was likewise the author of numerous papers in his special field of zoölogy. His influence was pronounced, also, in the development of younger students and in the establishment of the Seaside Laboratory at Misaki. After studying at American schools, Dr. Mitsukuri received, in 1879, the degree of doctor of philosophy at Yale, and later studied under Professor Balfour at Cambridge, England.

Drama.

THE NEW THEATRE.

The opening of the New Theatre on Monday was an important event in the dramatic history of this country for several reasons. Although in no sense a national enterprise, being founded on private capital, the institution is sufficiently broad in its aim, and sufficiently strong in financial backing to assume something of a national character. By no means purely philanthropic or disinterested, it is not mainly commercial in spirit, or subject to that malign syndicate influence which, for years, has been strangling dramatic art and making the theatre in general a subject for reproach and hissing throughout the English-speaking world. It is under intelligent and ambitious direction, has a properly organized staff of literary and practical advisers; a permanent stock company to be strengthened as occasion serves for the performance of all kinds of intelligent drama, old or new, classical or ephemeral; pledges itself to have no long runs and will diversify its entertainments with opera. If it lives up to its professions as it undoubtedly can afford and now means to do, it may prove the beginning of that practical reformation of the stage which has long been the dream of ardent but impractical enthusiasts. This pleasant and hopeful vision may or may not be realized. It is altogether too soon for either exultation or prophesy. But the establishment of an independent theatre and a stock company upon a solid and durable basis seems to be an accomplished fact, and is a legitimate source of great encouragement.

There is abundant promise of permanence in the house itself, a costly and noble marble structure, which will take high rank among the chief architectural features of the future city. It is fashioned within upon the best and latest models, and is replete with every convenience for the public before and the players behind the curtain. The theatre proper, a wide and flattened horseshoe, in accordance with the newest fashion, suffers somewhat from excessive ornamentation, but is notable for its capacity, for the comfort of its arrangements, and the perfection of its exits and approaches. The stage is wide and deep enough for every conceivable requirement of scenic display, and the lighting arrangements are peculiarly elaborate. It would be difficult, indeed, to imagine a theatre more complete in its appointments.

To say that the opening performance, that of Shakespeare's "Antony and Cleopatra," was in all respects worthy of its luxurious surroundings, would be an exaggeration. It did, however, furnish many evidences of liberal and intelligent management, which are rich in promise of future achievement. The tragedy itself, it is pretty safe to say, has never had a more effective, a more artistic, or a more appropriate scenic setting. Such liberties as were taken with the text—and the excisions were on a wholesale scale—are as a rule justified by the general result. Although many fine passages disappeared, nothing vital was lost—except the scenes in Pompey's barge, which have been ruthlessly erased in spite of their value in comic relief and dramatic interest—and a fairly continuous and intelligible story was presented. By putting all the Roman scenes in Cæsar's house and all the Egyptian scenes in Cleopatra's palace much saving of time was effected and the artists were enabled to construct two massive and imposing sets. The interior of Cleopatra's palace, with its huge pillars and its outlook across the Nile to the opposite shore, was particularly beautiful. The Roman scene was a very handsome piece of stage masonry, and Cleopatra's monument, with its majestic Sphinxes, provided another striking picture. But the excellence of the stage management was manifested chiefly in the purposeful and intelligent actions of the supernumeraries, the handling of soldiers, slaves, messengers, etc., which reflected much credit upon that experienced producer, Louis Calvert. All the minor "business" of the play, which is too often left to take care of itself, was conducted without awkwardness and without hitch.

But few of the speaking actors were really equal to the tasks assigned to them. Both in speech and action they betrayed their unfamiliarity with the needs of poetic drama. The blank verse was a perpetual stumbling-block to them. E. H. Sothern, the Antony of the occasion, made an unheroic and unimaginative impersonation still less attractive by the humdrum monotony of his utterance. Of the fierceness of the contending passions in the part he seemed to have no adequate conception. Once or twice, he let himself go with good effect—as in the attack upon Thyreus and in the quarrel with Cleopatra—but his performance, as a rule, was tame and uninspired. Miss Julia Marlowe's Cleopatra was beautiful to the eye and eloquent in rage. Some of her outbursts were exceedingly fine. But she lacked the essential cunning of the Serpent of old Nile. Her fickleness was too transparent, though her fascination was undeniable. William McVay played Enobarbus in blunt, soldierly fashion, but there is far more humor, in the character than he got out of it. Of the wonderful description of the famous barge he made nothing. Roland Buckstone did little with Lepidus, but Mr. Anson would have been an excellent Octavius if his elocution had been better. The best speaking was done by some of the minor players in the cast. Perhaps the most obvious moral of the entire representation was that no amount of expenditure can be of much avail to the poetic drama until our modern actors have recovered the almost lost art of acting and reciting it.

Sir Arthur Conan Doyle's new play, "The House of Temperley," is a melodrama of the prize-ring, founded in part upon his novel, "Rodney Stone." He holds that England owes much to the spirit of endurance which was the chief feature of the old prize-ring, and wishes to enforce that truth.

Glasgow now has its repertory theatre, and its experiment differs, according to a correspondent of the London *Times*, from those made in other places. It is financed "by a limited-liability association," made up almost exclusively of Glasgow citizens: university men, professional men, merchants, and manufacturers. The prospectus of the Royalty Theatre, where the plays are performed, sets forth as one of the objects in view "to encourage the initiation and development of a purely Scottish drama by providing a stage and an acting company which will be peculiarly adapted for the production of plays, national in character, written by Scottish men and women of letters." There is as yet no evidence of enthusiasm in Glasgow for a Scottish theatre: "Scotch writers are too sentimental for the Scotch; they have to go to London." Among the plays already produced, or in preparation, are "The Voysey Inheritance," Mr. Masefield's "Nan," "The Seagull" by the Russian Tchekhof, "Arms and the Man," etc. The company is said to be a good one, and is run on the regular stock company principle of each member taking the part best suited to him.

The first production in Paris of "La Rampe," a new play by Baron Henri de Rothschild, was signalized by the return to the stage of Mlle. Marthe Brandès. It is, as the title implies, a story of the footlights. A wealthy woman, becoming weary of an uncongenial husband, deserts him for a fashionable comedian. Going on the stage under her lover's guidance, she soon eclipses him, thereby estranging his love and exciting his furious jealousy. Before long he abandons her in favor of a vulgar little chorus girl. He still remains her instructor, however, and, while rehearsing under his direction the part of a deserted woman in a new play, she attempts to regain him by a final appeal. When he repulses her she finishes the scene with an actual, instead of a counterfeit, suicide. The piece is said to be a vivid exposition of stage life.

M. Antoine's resources as producer, not C. H. Hirsch's literary talents, are displayed to advantage in the new play at the Odéon, "Les Emigrés." Act i shows us the Canal and a Venetian *cabaret;* Act ii, the lower deck of an ocean liner speeding guilty lovers to America and a future unmarred by a drunken husband; the final setting is the stoke-hole, with that same husband, who has pursued the runaways on the same steamer, cremated for the audience's edification. All this is very cleverly managed and luridly depicted, but is not, after all, just what the *tout Paris* of the *rive gauche* expects to find at the second Théâtre Français. There is little of psychology, little of significant dialogue, to wash down this rather strong concoction. More than one assistant, admiring, the while, the melodrama's effectiveness, pinches himself to make out if he be not, after all, in the stalls of the Grand-Guignol.

Lionel Brough, the British comedian, died at London November 8, in his seventy-fourth year. Among his best-known impersonations were Tony Lumpkin which he played 777 times, and Bob Acres. He had successes also in Shakespearean comedy, notably as Touchstone. He visited America in 1885, with Violet Cameron, and at various times toured all parts of the United Kingdom, America, and South Africa.

Music.

The opening night of the season at the Manhattan brought an opera—Massenet's "Hérodiade"—which, though Brussels heard it as long ago as 1881, had never before been sung in this country. It was worth producing, as it contains some of the composer's loveliest airs, and is operatically effective. From the "Salome" of Wilde and Strauss, it differs utterly, the heroine being a pure maiden, who, when the Prophet she loves is executed by order of her mother, commits suicide. Two of the airs, "Il est doux, il est bon," and "Vision fugitive," have long been favorites in concert halls and homes. There is a great deal of splendor in the shape of processions, Oriental dances and backgrounds, and Mr. Hammerstein and his aids have staged the opera in a manner recalling the Paris Opéra in the days of Meyerbeer. Dalmores as Jean, and Renaud as Herod, contributed new dramatic portraits to their already famous galleries.

In the matter of novelties, our operatic managers are much more enterprising than they used to be. The Metropolitan announces no fewer than twelve works new to New York, and Hammerstein promises nine. Twenty-one new operas in one season will break all records; in fact, all records would be broken with half of the promised novelties produced. Among these are Bruneau's "L'Attaque du Moulin," Leroux's "Le Chemineau," Wolf-Ferrari's "Le Donne Curiose," Franchetti's "Germania," Paër's "Le Maître de Chapelle," Blech's "Versiegelt," and "Gypsy Love" by Lehar, the composer of "The Merry Widow." More important than these are three others, Tchaikovsky's "Pique Dame," Goldmark's "Cricket on the Hearth," and Humperdinck's "Children of the King." The list is completed by Laparra's "La Habañera" and Converse's "Pipe of Desire." Meantime, Mr. Hammerstein's list includes two operatic novelties by Strauss: "Elektra" and "Feuersnoth"; four by Massenet: "Hérodiade," "Griseldis," "Cendrillon," and "Sapho"; Leoncavallo's "Zaza," Hubay's "The Violin-Maker of Cremona," and "Natoma," an opera which Victor Herbert has in preparation.

One of the surprises and sensations of the season will doubtless be the production of Wagner's "Lohengrin," on Saturday afternoon next week, at the Metropolitan, not only because there will be a fine cast, with new scenery and costumes, but because the whole work has been, as the Germans say, *frisch einstudirt* with the same care that Conried bestowed on the first production of "Parsifal." New facilities for thorough rehearsal have been provided, the top floor of the Metropolitan having been set aside for that purpose. It is now possible to rehearse a German opera at the same time an Italian one is being sung before an audience, or vice versa, for there are two orchestras, making together over a hundred and fifty players. At some of the Wagner performances all of these will be heard together.

The number of undeservedly neglected comic operas and operettas is, perhaps, greater than that of the grand operas that were prematurely buried. This season we are to witness a general revival of them at both the opera houses. The Metropolitan has underscored "Fra Diavolo," "Czar and Carpenter," "Les Dragons de Villars," "Il Maestro di Cappella," "Il Signor Bruschino," "La Belle Galathée," "La Fille de Madame Angot." Mr. Hammerstein also will produce the last-named, besides "La Belle Hélène," "La Grande-Duchesse," "The Bat," "Le Jour et la Nuit," "Dame Blanche," "Orphée aux Enfers," "La Mascotte," "Les Dragons de Villars."

Boston's million-and-a-quarter dollar opera house, erected in Huntington Avenue, near theNewEngland Conservatory andSymphony Hall, by Eben D. Jordan, was opened on Monday evening with the rendition of Ponchielli's "La Giaconda." Mesdames Nordica and Homer and Señor Constantino were among the members of the new company heard at this première. There had been little opportunity to rehearse the opera, for the house was completed only just in time for the performance; which went off, however, more smoothly than this circumstance suggests. Acoustically, the new house is a great success.

Monteverdi's "Orfeo," the first performance of which was given in 1607, is to be revived this season at the Brussels Opera.

Paris is to hear "Salome" after all at the Grand Opéra. Richard Strauss had quarrelled with the managers some time ago, and, owing also to the difficulties which the theatre then was in, had withdrawn his work. But the opera is now in smooth waters again, and the composer has finally agreed to the performance. The cast is not yet arranged, except that Mary Garden will certainly sing the part of Salome, and that M. Delmas will probably be Iochanaan.

Art.

THE GENTLE ART OF BUYING FORGERIES.

We are in no position to say whether the wax bust recently bought by Director Bode of Berlin as a Leonardo was actually modelled by a Victorian sculptor named Lucas. But we do know that even if the story be true, it is a case not for mockery but for an admiring sympathy. It takes pluck to pay down public money for a beautiful nondescript object, to take the chances of deception and subsequent ridicule. It is because Director Bode takes such chances and makes his mistakes valiantly that he is the best buyer in Europe and his museum the richest, at the smallest cost, of all recent foundations.

Indeed, is there any better test of the efficiency of a museum director than a record of buying sufficient forgeries? Enough, mind you; not too many, for such lapses are expensive. But enough at least to prove that he has the courage not merely of his knowledge, but of his instincts; that he responds keenly to a beautiful object, and will incur the hazards of its possession. In other words, the museum and the collector who never buy forgeries will rarely buy masterpieces, and when they do will inevitably pay the highest price. The vagaries and blunders of such adventurers of the beautiful are so much evidence that their souls are alive. Dr. Bode has never failed to give such demonstration.

On a memorable occasion he discovered in his storeroom a Leonardesque altarpiece—mark the recurrence to this master—a thing of small beauty, and straightway promoted it to the galleries. The occasion was seized by the rival critic, Giovanni Morelli, who harped upon this indiscreet enthusiasm until a "Bode Leonardo" became almost as notorious among scholars as that staple article of commerce, "an Omaha Van Dyck," is among picture-dealers. But, as we have said, this comminatory way with erring experts fails to take into account the temperamental nature of their judgments. Science and dispassionate observation may be three-quarters of the battle, but the other quarter is a primitive and quite instinctive craving for beauty akin to that of the artist. This passion is naturally fallible, but it is also indispensable. Accordingly, it is better not to gloat over the blunder of a great expert, but to inquire how such a lapse comes about. To retrace the steps of error may be a lesson not only in human nature but also in charity.

In most cases, your expert need not fear the forgery. It is the work of an artist of a sort—otherwise it is wholly negligible—who has his own characteristics. One comes, in short, to know the forgers just as one does the masters themselves. There is, however, one moment when a falsification is really formidable, that is when it is unique in its class and seen for the first time. The strength of the expert is that he can visualize the memory of thousands of fine and real objects, confronting therewith any unfamiliar work of art that may come along. But what if the newcomer have no analogue in his experience? Then, evidently, the very basis of expertism is missing, and judgment must be passed by a kind of inspiration which naturally is subject to error.

This seems to have been the case with Dr. Bode in his recent mishap. Some fifty years ago, we are told, an erratic sculptor of talent, Richard Cockle Lucas, at the instigation of a dealer, did a wax bust, borrowing the forms of a Leonardesque painting. The bust disappeared, only to emerge some time ago as a bargain at a provincial sale. In London, it found admirers and rose to a price of £150, to pass eventually into Dr. Bode's hands in the thousands. Now what was he to do under the circumstances? Point of comparison there was none. The single wax bust of fine quality —that of Lille—is not by Leonardo and even its period is unsettled. Old painted wax is so rare that the effect of age upon it is not thoroughly understood. Dr. Bode has seen no other work of the versatile and forgotten Lucas. All the criteria of sure judgment were absent. What was he to do? Let a rival director pick up a possible Leonardo at a derisory price—or take the chances? He chose the perilous course and though his opinion was apparently wrong, we hold—observing Taine's fine and true distinction—that his judgment was right. A man is judged not by his weaker moments, but by his career as a whole, and if he had bought half a dozen Lucases, the Kaiser Friedrich museum would still be deeply in his debt for the money he has saved through thousands of shrewd and timely purchases. Now that Lucas has been disinterred, the matter is simple. It is easy enough for the rest of us to be wise at Dr. Bode's expense. As for Lucas, he may even establish an independent reputation like the Italian archaizer Bastianini, or the Russian Rukhomaski of Tiara fame. The wise amateur will not scoff overmuch, but rather thank his lucky stars that he was not the predestined discoverer of the wax works of the late Mr. Lucas.

These mishaps are the chance of the game, and the buyer of works of art who admits no defeats is either a sad dissembler or an incompetent. The real difficulty in museum management is not the occasional slips of directors and curators, but the timidity that demands certitude all the time. Connoisseurship being itself an art and not an exact science, certitude cannot always be had, and the opportunity missed by caution is grasped by audacity. The museums that need reform are not those that occasionally indulge in forgeries, but those that so cramp their purchasing power by the ignorance and timorousness of committees that paralysis ensues. Such museums buy no forgeries, to be sure, nor, except upon the most exorbitant terms, anything of any account.

The new building of the Boston Museum

of Fine Arts on the Fenway will be opened on Tuesday afternoon, with a reception to the guests of the directors. The museum is already open to private view. Many collections for which there was no room in the old building in Copley Square are now shown to advantage, besides numerous new acquisitions.

Among the most notable recent accessions of the Metropolitan Museum of Art is the statue of an Old Market-Woman, which will be a revelation to the public that knows only the nobler sculpture of the Greeks. The statue is of an old peasant, not quite lifesize, with the bent back of a woman accustomed to work in the fields. The mutilation of this armless figure has not cost it its interest, which resides principally in the realism of its action, and in the fact that we have here an unlovely representation of nature in her least beautiful form: the sunken cheeks, the old worn eyes, the hard lines about the mouth, the shrivelled neck and breast. The statue was found in Rome in September, 1907, in the cellar of an old building that was being pulled down. Examples of this naturalistic tendency are comparatively rare, writes Edward Robinson in the November *Bulletin* of the museum, but they constitute a well-defined class. "They all originated in the period . . . of the decline, when technical virtuosity took the place of greater ideals; and they are typical of one phase of the Hellenistic Age, which began with the death of Alexander the Great, B. C. 323, and continued until the Roman conquest of the various sites of Greek civilization." Except for a residual trace of Hellenic elegance—an irrelevant grace at that—it is no more significant than the sepulchral statuary of modern Italy. There are slight traces of painting, in which condition, happily departed, the statue must have been of appalling ugliness. Other acquisitions of the museum are a beautiful fragment of an early Italian Renaissance altar relief, the head of a singing or laughing child, pronounced by Dr. Bode to be the work of Antonio Rossellino, the reclining figure of a boy child, in bronze, ascribed to Verrochio, and numerous interesting examples of the Gothic and Renaissance decorative arts.

Through the generosity of Charles P. Taft of Cincinnati, Scott & Fowles, the art dealers, open their new galleries in Fifth Avenue with a remarkable exhibition of portraits by masters of the seventeenth century Dutch school and of the eighteenth century British school. The place of honor is occupied by the "Pourtalès Rembrandt," the Portrait of a Young Man Rising from his Chair, which was painted in 1633, at Amsterdam, when the artist was twenty-six years old, and his model must have been about the same age. This dark-eyed young man is full of health and of the joy of living. He is richly dressed in black, and wears a large black hat, a broad lace collar, while a black cloak hangs from the left shoulder. The face, the left hand, which is exquisitely drawn, and the lace collar, except on the extreme left, are bathed in a brilliant ray of light, from which the young man is emerging—lifelike. The picture is smoothly painted, as were all Rembrandt's of that date. There is none of the impasto of his latest period, although the carefully painted lace collar and the high lights in the metal ends of the knots that adorn the dress give one the impression of impasto. The picture is in a marvellous state of preservation, and has apparently never been touched up since it left Rembrandt's easel. It lacks the mellowness of age in the high lights. This is owing to the old varnish having been recently rubbed off on account of a blemish, and it will take two or three years before the new varnish takes on a patina. Perhaps the most notable of the portraits by Hals shown here is the Young Woman with One Arm Over the Back of a Chair, which is no less charming than his Isabella Coymans in the Hudson-Fulton exhibition. In the presence of the Dutch pictures it must be confessed that those of the British masters, except in one case, the Portrait of a Boy, by Sir Henry Raeburn, look rather artificial. The one landscape shown is a Hobbema, with cattle and figures painted by Adriaen van de Velde, which has less brown and more green in the foliage than Hobbema usually introduced into his landscapes, and with less tightness in the painting of the leaves. There is much beauty in the peeps of sunlit landscape one gets through the wood that borders a sedgy pool. The exhibition will continue for about a week from the present date.

An exposition of the masterpieces of the art of the Mussulman will take place at Munich in the course of the next year. The art of the caliphs prior to 1258, Moorish art in Spain and northern Africa to 1500, the contemporary art in Sicily, the influence of Oriental art upon mediæval Scandinavia, Persian art during the domination, souvenirs of the Crusades, the influence of Persia on Russia and Poland, Turkish art from 1400 to 1700, the influence of Turkish art upon that of Italy and its reciprocation, Turkey and Germany, French painting and Turkey—these are some of the classifications which have been made.

A volume of pictures devoted to the beauties of "Oxford and Cambridge" is promised by Sir Isaac Pitman & Sons, the drawings being by Hanslip Fletcher. Thirty-five members of the universities contribute descriptive notes on their colleges; among them, the Provost of King's, and the Wardens of Wadham and Keble. The Registrar of the University of Cambridge, besides describing several colleges, furnishes an Introduction to the whole book, dealing with the history and architecture of the two universities.

The first issue of *The Art News*, the only art newspaper published in the United Kingdom, has just made its appearance. It is edited by Frank Rudder.

On the occasion of a second and apparently unaltered edition of Edward Dillon's "The Arts of Japan" (A. C. McClurg & Co.), we need only recall that the early periods are treated very summarily, and that especial emphasis is laid upon matters in favor with European collectors—the popular school of illustration, metal work, lacquer, and, in general, the minor arts.

Charles Hitchcock Sherrill, whose "Stained Glass Tours in France" is favorably known, has folowed it up with a "Stained Glass Tours in England" (John Lane). The tours proposed are four—one for each of the main periods of glass-making. This scheme, if literally carried out, necessitates doubling on the trail; York, for instance, must be visited several times, as an exemplar not only of early English glass, but of glass of the decorated and perpendicular styles. Probably most travellers will take all their impressions of a given place at once, but they will find Mr. Sherrill's insistence on chronological sequence logically helpful. The demarcations are made on the simplest lines, disputed technical questions are not raised, elementary historical references are supplied, and the enthusiastic spirit of the author combines with the intrinsic charm of his subject to suggest a seductive programme for one's next vacation.

From Paris is reported the death of Ernest Rupin, aged sixty-four years. He was the creator and, equally, the curator of the museum at Brive, and was the author of important archæological studies: "l'Œuvre de Limoges" (a monograph on the limousine enamels), "les Cloitres et l'abbaye de Moissac, Roc-Amadour," etc. He shared with M. Martel in the subterranean exploration of the Causses du Quercy.

C. P. Fieffé, reorganizer of the Ceramic Museum at Nevers, as also curator, and born at Châtillon-en-Bazois, December 11, 1839, has recently died. He was the recognized authority on the faïences of his district. Among his studies of his special subject was the book issued in 1901 entitled, "Les Faïences patronymiques, caractéristiques des saints dans la céramique nivernaise."

Finance.

FIFTEEN-CENT COTTON.

On the last day of October, 1908, cotton for May delivery closed in New York at 8⅞ cents a pound. Its closing price of last September was 13¼ cents. On the closing day of October, 1909, "May cotton" crossed 15 cents. It had not passed that mark since March, 1904; even in 1906 and 1907, when cost of living pressed hard in almost every line of the consumer's purchases, 12½ cents was the highest figure reached. The spot price of 15¼ cents, reached last week in the New York market, has been touched in only one year since the paper money days.

The causes of this remarkable showing in a staple market are sufficiently known. The rise in cotton was foreshadowed, not only by the poor results of the crop in the Mississippi Valley and the Gulf States, but by the bold and audacious operations of a group of Chicago and New Orleans speculators, undoubtedly supported by a more widespread individual "buying for the rise" than is often seen in a staple market. In its larger aspect, the price bears hard on the every-day consumer, who as a rule has had his wages and salary kept down by the financial unsettlement following 1907, who for a year past has seen his rent, grocery, and butcher bills rising to almost unprecedented figures,

and who now is threatened with a similar mounting-up of the bill for clothing.

It is also true, however, that the everyday man has a means of meeting an exorbitant price of cotton which he does not possess in the case of food. He cannot eat yesterday's dinner to-day, but he can wear the clothes of 1909 through 1910. This is the pitfall of a professional cotton speculation, even with statistics in its favor. The cotton mills know by experience, and if they do not know it, the merchants and department stores are apt to remind them, that the cost of clothing can be raised only a certain fairly well ascertained distance before a large consignment of goods becomes unsalable.

The present market has led naturally to the drawing of analogies with the famous "Sully corner" in the autumn of 1903 and the spring of 1904. Chronologically, however, the course of prices in that season differed widely from the present autumn. "Cotton futures" had been up to 13¾ cents a pound in July, 1903; at the end of October, the May delivery was only 11 cents. It got up to 12 at the end of November, and the government's unexpectedly low crop estimate of 9,962,039 bales, on December 3, sent the price, by the last week of the year, to 14¼.

In other words, the price of cotton, even with an official estimate (subsequently proved to be very close) for less than ten million bales, did not reach, up to the end of December, the 15-cent price scored this year on the last day of October. It was not, in fact, until the closing week of January, 1904, that "May cotton" crossed the 15-cent mark for the first time in the season. It got up to 16⅝ at the end of January and to 17⅜ in the opening week of February. That was the highest. Enormous speculative sales, the ensuing week, caused by the shut-down of the mills, broke the price to 12⅝, and subsequent developments proved pretty clearly that Sully's colleagues in the pool had taken that opportunity to betray him and "unload." Cotton recovered to 16⅝ in the second week of March, but on March 18, the failure of Sully being suddenly announced, the price fell again to 12⅝ cents. It ruled only a cent or so above that figure during the balance of the season.

It will be seen from this that the violent rise of 1903 began much later in the year than the rise of 1909; that last October's price was not achieved, that season, until three months after this year's date; that efforts of speculators to push the price much higher ended disastrously for them; that the market's culminating point came less than a fortnight after the 15-cent line was crossed on the advance, and that the price speedily fell again below that level.

But this does not of itself prove that the situation of to-day may not be so much worse than in 1903 as to warrant an earlier rise and higher prices. In October, 1903, Ellison estimated 10,877,000 bales as the world's requirements of American cotton; a year later, he figured out that 10,273,000 had been actually consumed, despite the exorbitant prices. Two weeks ago, he estimated the requirements for the coming season at 12,625,000 bales. This is a striking difference, and shows why a cotton crop which used to be called abundant will not now suffice.

It does not mean, however, that, in order to avert a famine, the American crop of 1909, like the world's requirements, must be 1,700,000 bales above that of 1903. The world's total supply of cotton on hand at the end of this October was greater by 1,395,000 bales than at the end of October, 1903; the supply of American cotton alone was greater by 1,457,000; this was because of the enormous crop of 1908. If, then, our crop this season were to be 11,000,000 bales, that yield, plus the increased visible supply as compared with 1903, would place us in a position where the Ellison "requirements" could be more easily met than they were six years ago. Supply would run very close to demand. A crop of only 10,000,000 bales, on the other hand, would place the consumer in a distinctly worse position than in the "Sully year."

These are considerations which will lend to the Agricultural Department's estimate on the actual cotton yield, to be published about a month from to-day, an interest almost as absorbing as was enjoyed by the famous government estimate of December, 1903, which the cotton trade received with excitement and emotion.

Burton's Masters of the English Novel

A Study of Principles and Personalities. By RICHARD BURTON, Professor in the University of Minnesota. ix+357 pp. 12mo. $1.25.

A discussion of the indubitable masters of the English novel from Fielding to Meredith, Hardy and Stevenson.

Professor W. H. Hulme, Western Reserve University: "A masterful book of its kind. Burton's criticisms of the great English novelists seem to be so sane, so simple, and withal highly illuminating."

Seward's Narrative and Lyric Poems

By S. S. SEWARD, Jr., Assistant Professor in Stanford University. xv+512 pp. 16mo. $1.00.

The contents of this volume are based upon the recommendations of the National Conference on college entrance examinations, but these poems are supplemented by many others, including specimens of the old ballads. The arrangement of the poems is logical. Adequate notes and Suggestive Studies are supplied.

Recent Publications in Political Economy and Political Science

THE AMERICAN NEWSPAPER. By JAMES EDWARD ROGERS.

This book is an intimate study of the American newspaper, and a reply to certain severe criticisms that have recently been made. The author has tried as far as possible to see both sides of the question, the subject of discussion being treated as one of concrete fact, and he has therefore examined some fifteen thousand newspapers from all sections of the country as a means of getting acquainted with the necessary basis for an accurate judgment. The book discusses in succession the following topics: The Historical Evolution of the Modern Newspaper; The City and the Newspaper; the Nature of the American Newspaper; the Influence of the American Newspaper, and the Causes of that Influence. 228 pages, 12mo, cloth; net $1.00, postpaid $1.10.

A MODERN CITY: Providence, R. I., and Its Activities. Edited by WILLIAM KIRK.

A popular description, by experts, of the city of Providence, under the following heads: Introduction; Geography; Population; Industry; Labor; Government; Finance; Education; Art; Philanthropy; Religion. For the sociological study which has received so strong an impetus in our day, nothing more apt can be imagined than this thoughtful, illuminating book. And for those who are not sociologists, but who take an intelligent interest in the welfare of our cities, the volume will have a value and a charm quite unique. It is confidently commended to the reading public, both in Providence and elsewhere in America. Illustrated, 374 pages, 8vo, cloth; net $2.50, postpaid $2.70.

THE CAMERALISTS: The Pioneers of German Social Polity. By ALBION W. SMALL.

To readers of English only, cameralism is virtually a lost chapter in the history of the social sciences. Although everything now belonging to German polity has a part of its heredity in that type of social theory, not every reputable student of the social sciences in America could correctly define the term, and few could name more than one or two writers to whom it is properly applied. In this volume there is given to readers of English the first reliable and detailed account of the cameralistic school. 500 pages, 12mo, cloth; net $3.00, postpaid $3.18.

INDUSTRIAL INSURANCE IN THE UNITED STATES. By CHARLES RICHMOND HENDERSON.

This describes the systems of industrial insurance in Germany, Italy, Sweden, Denmark, Austria, Spain, Finland, and Australia; it explains the plans now used by American business firms, such as Swift & Co., Studebaker Bros., The International Harvester Co., Western Electric Co., New York Edison Co., Steinway & Sons, and The Standard Oil Co. Compulsory insurance is no more unreasonable than compulsory education or compulsory taxation. It is a logical social development, and this book is the most comprehensive analysis of the movement yet published. 448 pages, 8vo, cloth; net $2.00, postpaid $2.19.

MODERN CONSTITUTIONS. By WALTER FAIRLEIGH DODD.

This collection contains the texts, in English translation, where English is not the original language, of the constitutions or fundamental laws of the Argentine nation, Australia, Austria-Hungary, Belgium, Brazil, Canada, Chile, Denmark, France, Germany, Italy, Japan, Mexico, Netherlands, Norway, Portugal, Russia, Spain, Sweden, Switzerland, and the United States. These constitutions have not heretofore been available in any one English collection, and a number of them have not before appeared in English translation. Each constitution is preceded by a brief historical introduction, and is followed by a select list of the most important books dealing with the government of the country under consideration. 2 vols., 750 pages, 8vo, cloth; net $5.00, postpaid $5.42.

PRIMARY ELECTIONS. By C. EDWARD MERRIAM.

For students of American political history, and especially of American party history, this volume will be particularly valuable. It gives a clear account of the various laws and cases and a critical discussion of the present primary question. The absence of literature on this subject makes the appearance of the book especially timely. Many general readers as well as the special students will find it of interest. 300 pages, 12mo, cloth; net $1.25, postpaid $1.35.

THE PROCESS OF GOVERNMENT: A Study of Social Pressures. By ARTHUR F. BENTLEY.

The position assumed is that all types of political organization, whether they find their leadership in demagogues, "bosses," rulers, or goverment functionaries, and all types of public opinion, from the most elaborate political theories to the most fugitive of popular beliefs, have value and meaning in the social process only as they give expression or representation to underlying group interests of the population. These interests are not always of a kind that may be readily observed. Sometimes they are recognized by the actors in the given events, and often they can be definitely detected and measured only with most painstaking labor. They are not even capable of description as interests, save in terms of masses of men having definite relations to other masses. 518 pages, 8vo, cloth; net $3.00, postpaid $3.20.

VALUE AND DISTRIBUTION. By HERBERT J. DAVENPORT.

The author thus defines his position in his preface: "Since the time of Adam Smith, economic theory has been in possession of doctrines enough for a reasonably complete, consistent, and logical system of thought—if only those doctrines had been, with a wise eclecticism, properly combined and articulated. The value, then, of this book is not so much in any contribution of new doctrine as in the selection, delimitation, and articulation of the old. To this end, the necessary thing has been to rid the science of theories that do not belong to it." 594 pages, 8vo, cloth; net $3.50, postpaid $3.72.

THE TRUE NATURE OF VALUE. By RUFUS F. SPRAGUE.

Since the time of Ricardo, contributions even on the theoretical portions of economics have been made by practical men of affairs. Mr. Rufus F. Sprague, a manufacturer of Michigan, also presents herewith his life-long studies on the subject of exchange value. In political discussions upon money he has taken an important part, and in the campaign of 1896 he was the gubernatorial candidate of the Gold Democrats in Michigan. He later reduced his thinking on money to a systematic form in connection with the fundamental principles of value. Thus a man of success in the business world was led to an exposition of a theory of value closely resembling that of Bastiat. 192 pages, 12mo, cloth; net $1.00; postpaid $1.10.

ADDRESS DEPARTMENT 21

THE UNIVERSITY OF CHICAGO PRESS

CHICAGO **NEW YORK**

The Nation.

NEW YORK, THURSDAY, NOVEMBER 18, 1909.

The Week.

Anything quite so humorous as Speaker Cannon's charge that Herman Ridder offered him the Presidency, on a silver platter, with the compliments of the metropolitan newspapers, if he would repeal the duty on print paper, we have not read this many a day. Mr. Ridder is an estimable and useful gentleman, whose services to the newspapers in endeavoring to obtain decent treatment from Congress were deserving of high praise. We have yet to learn, however, that he has become a candidate for Bedlam, and such he must be if he made any such offer to Mr. Cannon. Of course, he did not; his word on that point would suffice even if every probability were not on his side. Mr. Ridder has seen every newspaper in New York try to defeat a given candidate for the Mayoralty—in vain. He knows, moreover, that no one can "deliver" the newspapers of this city; it is only by accident that they ever pull together on any important proposition. But more than that, unless Mr. Ridder was suffering from a complete mental aberration, he must have known that if all the city newspapers of the country were to band together they could not elect Mr. Cannin to the Presidency.

Mr. Hearst is to be congratulated on his escape, more or less narrow, from being elected Mayor of New York, an office to which he confesses he looked forward with much apprehension as a harassing and profitless burden. Mr. Hearst is not the only man who has reason to congratulate himself. Success has a habit of lying in wait around a dark corner, sandbagging its victim, and dragging his unconscious and prostrate form unto the highest pinnacle of fortune. Happy the man who can elude her. Mr. Bryan rejoices that his triple evasion of the Presidential chair has enabled him to see more strange countries and to lecture to more American citizens than if he had been compelled to settle down in the White House. Señor Castro points out that the climate of Caracas is not fit to be mentioned with that of Northern Spain and the Riviera, and every night when he goes to bed he can't help feeling sorry for President Gomez. At Salonika, Abdul Hamid says he is positively getting fat under the peaceful régime that followed the dispersal of his harem. President Zelaya is understood to be preparing a statement in which he shows that the annual expenditures of a Chief Executive of Nicaragua regularly exceed his income. The Sugar Trust can only rejoice that it has at length been convicted of theft; the stings of conscience it experienced these twenty years were something awful.

The amusing war over the California lemon continues. Our readers will remember that the lemon-growers of that State induced Congress to put a higher tariff on foreign lemons. The neat profit they expected to get under this arrangement from the ultimate consumer was, of course, to go into their own pockets only. Their anger was unlimited, therefore, when the railways calmly thought that they ought to have the benefit of this "rake-off" and raised their freight rates so as just to equal the profit from the tariff. Promptly the growers went on the warpath. The ultimate consumer was very well as long as they alone mulcted him, but their sympathy for him when he was robbed by those scandalous railways was fairly overflowing. Unable to move the cruel transportation corporations by tears and threats, the lemon-growers have obtained a temporary injunction against three railways—the Santa Fé, the San Pedro and Los Angeles, and the Southern Pacific—forbidding them to raise their rates. Doubtless, the lemon-growers are deeply thrilled as to the success of this unusual move. But the ultimate consumer can hardly be expected to be interested. He is going to be robbed by act of Congress whether the railways or the growers do the fleecing.

The pension system established by the New York Central on its main constituent lines is another step in a direction toward which, it should appear, all our great railway corporations are tending. Its principal provisions call for the retirement of all employees at the age of seventy, with the right to a pension if the employee has been in the service of the company for ten years or more. Twenty years' continuous service entitles an employee to a pension before he has reached the age of seventy. The amount of compensation is 1 per cent. for each year of continuous service based upon the average rate of pay during the ten years preceding retirement. In the matter of age limit and rate of compensation the Central pension is the same as that already in force on the Pennsylvania Railroad. What does such a plan mean to the company and what to the pensioner? The Pennsylvania Company's annual reports show that from 1903 to 1908 it has distributed $2,370,000. From 1903 to 1906 its annual appropriation for pension purposes was $390,000. In 1907 and 1908 it was $600,000. The number of pensioners on the rolls of the company at the end of 1903 was 1,599; in 1908 it was 2,176. The average number of men retired annually has been 308, and the average number of deaths among pensioners has been 190. The retirements and the deaths, of course, are bound to increase for a long time.

The horrors of the mine disaster in Illinois are intensified by the magnificent heroism of the twelve rescuers who deliberately went to their deaths in the fiery mine in an effort to save their imprisoned fellows. This is the kind of courage which is infinitely superior to any other, since it is a voluntary and deliberate placing of one's life in the balance to save others. That such heroism exists in every walk of life is the final reply to those strenuous souls who pretend to believe that courage, manhood, and all the primal virtues would disappear if there were not occasional blood-letting by nations on sea and land. Only two weeks ago, there was a similar example of heroism at an explosion in the Barren Colliery near Bargoed, South Wales. There, too, a rescue party, headed by no less a person than the general manager of the mine, went in, the manager and two others going to their deaths. Of a subsequent body of rescuers, equally brave, three more lost their lives.

If there is anything redeeming about the hideous lynchings at Cairo, Illinois, it is that the mob did not draw the color line. The breakdown of government was complete; the mob was left undisturbed in its career. It made a mockery of religion by letting one of its victims pray publicly and then promptly violating more than one of the Commandments. Gradually, Illinois is acquiring the name of a great lynching State, and for this the failure of justice is alone to blame. Nobody was punished for the riots and murders at Springfield, the sole excuse of which was the false charge of an abandoned woman; and of this fact the mob in Cairo was doubtless aware. That women, too, should have assisted in the lynchings shows how far the demoralization has gone. It is impossible to believe that such horrible wrongs to individuals and to society as are perpetrated by these mobs can go unpunished.

The death of a University of Virginia student, murdered in a mass play in Saturday's football game between his institution and Georgetown University, is the chief feature of the week-end list of casualties reported in the press. This victim was killed in virtually the same way as Cadet Byrne—he was unfortunate enough to fall at the bottom of the heap. If college presidents will not act, save to hide behind athletic committees and less responsible rules committees, it is time for public opinion to exert itself again. A few years ago it stopped the flying wedge. This year it can stop this abominable mass play. The Rules Committee can do it at its meeting in December, if it sees fit. But with all deference to the gentlemen composing that committee, they should be made to feel that if prompt action is not taken, their whole beloved game is likely to be endangered. The St. Louis Board of Education has called upon the Superintendent of Education to show cause why football should not be abolished in that city's schools. Other boards are likely to follow Columbia's admirable example and abolish the game altogether until it can be made reasonably safe.

Professor Hyslop brushes aside the mere suspension of physical laws as something that can be explained in any number of ways. If that be so, he is right in taking no stock in Eusapia Palladino. That lady's gifts seem to be entirely connected with the production of visible and audible miracles—shadowy mouths which open to tell the secrets of the other world, shadowy hands which grasp cigar-holders and twang mandolins suspended in the air, and shadowy fingers which model portrait heads in wet clay. Tables and chairs which rise in the air are a commonplace of Eusapia's exhibitions. Camille Flammarion, who has experimented extensively with Eusapia considers the phenomenon of levitation as absolutely established, and this because he has seen the marvel performed in the full light of a gas chandelier. It is the aversion of most other mediumistic phenomena for the light that makes Flammarion hesitate. Why must the gas always be turned low before the psychic forces will condescend to bring an auditor a message from Shakespeare, or pinch his cheek or hit him smartly in the ribs?

The authenticity of the Leonardo da Vinci wax-bust at Berlin is now established and Dr. Bode stands unshaken on his pedestal. During the absence, in East Africa, of the most competent authority to speak on the subject, the Kaiser has gone to the trouble of inspecting the aspersed masterpiece, and has pronounced it genuine. England cannot now persist in its criticisms against the Berlin Museum without supplying a *casus belli*. After all, it is a fine thing to have infallible authority to fall back upon in the hour of need. Literary criticism during the silver age of Latin poetry profited greatly by the simple but effective methods of the Emperor Nero. Differences of opinion regarding the beauty of a particular hexameter melted away before the imperial suggestion that obstinate critics ought to get into a warm bath and open an artery or two. In our own democratic age the very mention of such a thing as a standard is sacrilege. Criticism is at its finest nowadays when it asserts that I am right, and you are right, and everything is quite correct. But that in the end spells chaos. Hence we must rejoice that what Taine and Brunetière could not do, is done so thoroughly and so easily by the most versatile of the Hohenzollern.

The devotee of the classics has many an adverse influence to contend with, but there is hardly warrant for the discouraging view of a recent editorial in the *Classical Weekly*. Teachers of Latin are not alone in finding many of their pupils convinced in later years that their work in that subject was practically fruitless. The same charge is continually brought against both school and college training in English, sometimes with justice and sometimes not. It is true that the study of history "has developed amazingly in the method of presentation," but a good deal of the amazement is centred upon "original research" by raw undergraduates. And even in the natural sciences, the "correspondingly new methods" are already encountering severe criticism just because they are sacrificing thorough drill in the elements to undue haste for results. It may savor of supererogation to defend the classicists against their own admissions, but there is at least room to question whether their work is essentially weaker than that of their associates in other branches of learning, taking due account of the resources at their command.

The rumor that England will now experiment with a semi-submarine battleship does not surprise us. We have long believed, in our ignorant layman's way, that there ought to be a return to the Ericsson type of monitor, improved by modern ideas on ventilation, etc., but we have always been pitied by naval officers for showing our ignorance in this manner. They have assured us that life cannot be made bearable on semi-submarines, that guns cannot be fired in a seaway save where there is high freeboard, and that even if a modern battleship is a wonderfully fine target at sea, with its heavy superstructure and its towering military masts, this type must survive. Well, the British Admiralty declines to be bound by tradition, and the semi-submarine is to be tried. More than that, some of our own officers—doubtless mere cranks—incline to the view that the semi-submarine will come to stay. Thus Rear-Admiral G. F. F. Wilde, retired, is enthusiastic in its praise, and speaks of the objections to it in these words:

> The boat swims like a shark. The waves do not break on her, but merely slur over. The other prime objection brought up against the proposed new type is the low freeboard, which, they say, will prevent the

manipulation of her guns in a heavy sea. This is nonsense. I've been in southwestern typhoons in the China Sea, which is the roughest water on the face of the globe, and I never saw the time yet when I could not open up the ports and train my guns. The new type of battleship could be built at much less cost, four semi-submarines equalling in cost one Dreadnought.

Yet these same arguments Rear-Admiral Wilde answers have always been brought up against the construction of modern monitors, just as they were used in 1862 against Ericsson's cheesebox on a raft.

The outcome of the Steinheil case is what every close student of popular opinion expected after the second day of the trial. It would have been a sad miscarriage of justice if the jury had brought in a verdict of guilty against a woman out of whom a hundred newspaper correspondents have made such admirable copy; whom a hundred word-painters have depicted in a hundred picturesque moods, from tigerish defiance to complete abasement; whom Parisians have paid five hundred francs apiece to stare at. The end of such *causes célèbres* is so invariably the same, whether in America, under our fine, loose, go-as-you-please common law, or in France, under the iniquitous Roman law beneath which four-fifths of civilized humanity have suffered these few thousand years, that it seems almost a pity to set the complicated machinery of justice grinding away for nothing. In this country the process takes months; in France it takes weeks. But for all the hot cross-questioning and challenging of talesmen, the fiery allocutions and exceptions, the vast array of expert testimony, the serpentine advance of the hypothetical question, the American public knows from the beginning that a Harry K. Thaw will never go to the electric chair. And in France, for all the rhetorical invective from the bench, a Steinheil, with more reason than a Thaw, we admit, is pretty sure of escaping the severest penalties of the law. On the ground of mere economy it would pay New York County or the French Government to compromise with the next prominent defendant in a murder case by offering him ten or fifteen thousand dollars, and calling it quits.

Austro-Italian relations are temporarily under strain because of an indiscreet speech by a high officer of the Italian army. The Latin temperament appears in the frequency with which the French and Italian governments have to put a general or an admiral on half-pay because he forgot that *inter arma* soldiers had better keep a silent tongue in their heads. This particular Italian delinquent is accused of having said that beyond the Alps lay Austria, and that under her rule groaned many a Latin city which soon should be delivered. Here again was a crack in the Triple Alliance which has been showing such alarming structural defects of late. Will Italy fall away from that alliance? For the distant future it is rash to predict, but no such immediate contingency presents itself. Whom must Italy have behind her in a war with her present allies? France, at the least. Whom must France have behind her before she does go to war? Russia. But that Russia is a slender reed to lean upon French statesmen are well aware. That French aid would come to Italy against Austria is also a highly speculative question. Not until Russia is a civilized government with civilized institutions can she be instrumental in breaking up the Triple Alliance.

Our retiring Ambassador at St. Petersburg gives a roseate picture of conditions in Russia. The country is prosperous, constitutional government is working itself out nicely, and the people are contented. Mr. Riddle has the proper optimism of the diplomat in a strange land. How neatly constitutional government is functioning in Russia may be understood from a St. Petersburg dispatch which tells of the condemnation of one of the leading lawyers in that city to a year's imprisonment in a fortress because of a speech he made at the trial of those implicated in the Jewish massacre at Bialystok, about three years ago. This is the measure of liberty of speech in Russia. It is true that the country this year is more prosperous than it has been for decades. Undoubtedly, the Duma still enjoys the happy privilege of repeating "yes" and "no" after the Czar's ministers. True, the spark of constitutional government is alive in Russia, but we have only to remember that the Government still looks upon the Constitutional Democratic party, led by M. Milyukoff, as "illegal," to see with what difficulty that spark burns on.

What treatment will the Russian Government accord to Nicholas Tchaikovsky in the face of the world's exasperation at the Spanish Government's treatment of Ferrer? There are reports that Tchaikovsky's approaching trial for treason will be conducted behind closed doors, in violation of the Russian Premier's promise that he and his fellow-prisoner, Mme. Breshkovsky, should receive a fair trial. Public opinion should lose no time in protesting against such an iniquitous procedure. In the case of Ferrer, public opinion had scarcely time to pull itself together, men had scarcely time to make up their minds that the danger was real, when the blow fell. There should be no chances taken in the case of the Russian patriot, whom this country and England have come to know as one of the most high-souled and devoted men who have ever fought for a great cause. Premier Stolypin rules with a strong hand, but he should be made to see the folly of practically instituting court-martial at a time of revolutionary inactivity. This is not the way to keep the peace.

The attempt upon the life of the Viceroy of India in Bombay last Sunday will be deplored by no one more than by the sincere friends of the new India. Very important concessions have just been granted to India's demand for a greater share in her own government. An Indian representative now sits in the Viceroy's executive council, the body that rules the peninsula and largely shapes Britain's policy towards her Indian subjects. At the present moment preparations are under way for the elections to the reorganized Provincial Councils in which the native element is to have a majority. This is progress, and greater concessions are bound to come unless an outbreak of anarchy should play straight into the hands of the British reactionary element. The liberties granted are not Home Rule, but one need not be a thick-and-thin defender of the British supremacy to maintain that complete independence for India is at present out of the question. Unfortunately, the gospel of dynamite has been pretty well spread in Hindustan these last few years; fanaticism is native to the soil, and life is so abundantly cheap that the advocates of violence can always count on plenty of fools or tools to stir up mischief.

THE PLOT.

It was bound to come, this "anti-Taft plot" with which the President found Washington buzzing on his return. The only question was when; and perhaps this between-excitements period was as good as any in which to uncover the conspiracy. Too many worthy writers for newspapers and magazines had been suffering from suppressed muck-raking to make it probable that they could restrain themselves much longer. If the outbreak has come sooner than was generally expected, this only goes to show that the public pretence of desiring a good rest was hollow. As the French are said to be constantly in need of a traitor to buoy them up, so we really cannot get along without great political scandals, exposed villanies in high place, and secret machinations laid bare. Old habits are not so easily broken. After having fed on sensations and slept with conspirators for a long course of years, we are not going to lapse easily into an era of good feeling and humdrum virtue. At heart, we have all become Hotspurs, crying fie upon this quiet life.

As we have said, the attack upon the Taft Administration by those whose hearts are far away in Africa was certain from the beginning. Its first rumblings were heard before the new President was warm in his chair. There were early to be seen men who could not contain their grief over the signs of "reaction" in the White House. Within the first month of Taft's term, we pointed to the predictions and threats openly made that there would be a terrible ripping up of a Cabinet stuffed with corporation lawyers. To-day, Washington is convinced that the storm is beginning to burst. Secretary Ballinger has been directly assailed, and informed that he "must go." The report is that the Secretary of State has discovered that he, too, is involved in the hostile movement. The Postmaster-General is about to be placarded as guilty of a nefarious agreement with a wicked corporation. The other members of the Cabinet are said to be looking at each other in a kind of wild surmise, and asking: "Which of us is safe?" Only one thing is sure, that there is a plot. No one knows exactly what it is, but with its existence certified to by so many credible if not credulous men, the country ought to breathe easily again. Our institutions must be working normally once more if the air is full of treasons, stratagems, and spoils.

Many are in the dark about the real scene of the conspiracy. It is not in Washington, nor in the East at all, though the operations seem to be conducted in this part of the country. The true objective is the West. Ammunition exploded here is really designed to wake reverberations among the majestic Rockies and to make the Oregon no longer able to hear its own dashing. This is the explanation of the apparent futility of the renewed attack upon Secretary Ballinger and, by implication, upon President Taft. Hereabouts, it fell as flat as Scott's poem on Waterloo. But it is a different matter in the West. Out there, thousands and thousands of Republicans are only waiting for the official signal to rise and cry "We are betrayed," and to begin a furious campaign against everything that is "reactionary." What the East may ignore or dismiss with a smile, the intenser and more jealous West will take in tremendous earnest.

Though something of this is said to be forcing itself upon the serious attention of the Cabinet, the Washington dispatches represent the President as very little disturbed. He expects to be able to meet his enemies in the gate. The Secretary of the Interior is to make an official report which will confound and crush his assailants. In his annual message, Mr. Taft is to show that he is the sworn champion of all the "policies." But they reckon ill who imagine that what is essentially a state of nerves can be dealt with in a calm and rational manner. Hysterical unreason will shed all the mere reason that can be poured upon it. And there is great difficulty, too, in anything like a counter-attack. Muck-raking does not work both ways. One sees efforts, for example, to make a good deal of the fact that President Roosevelt's supineness, to say no more, allowed the Sugar Trust's thieving to go on unchecked, and let the Custom House rottenness alone; and there are rumors of other damaging matter that may be published in the attempt to show that the idol's feet were of clay. But does any man delude himself by supposing that this will affect the great heart of the West? The returner from Elba will have only to denounce all this as a fresh conspiracy against him by wicked malefactors, and the troops sent to capture him will fall on their knees and beg him to lead them against the money-power—and incidentally into good offices.

Such speculations about the future, however, are not so immediately absorbing as the great and cheering fact that we have again a plot. Public life, then, is to be interesting once more. From dull discussions of tariffs and the revenue and currency, we shall turn lightheartedly to such really vital questions of statesmanship as whether Gifford Pinchot habitually carries a long knife under his coat, whether a magazine editor has been detected in Postmaster-General Hitchcock's office disguised as a Guggenheim, and whether Collector Loeb has been passing, duty-free, invoices of poisoned arrows from Africa.

CONGRESS AND THE SUGAR TRUST.

After the latest disclosures and allegations in the Sugar Trust affair, there can no longer be any question as to the action which Congress must take in the matter. A thorough and searching investigation by a committee of high standing ought to occupy a foremost place on the programme of the coming session. Such a committee ought to call before it, not only the officers and employees of the customs service who are concerned, either as accusers or accused, in the enormous frauds alleged, but the high officials of the Government and of the Sugar Trust whose names have figured in connection with the matter. It is not alone the scandalous character of the frauds alleged, and the magnitude of the robberies charged to agents of the company, which make such Congressional investigation inevitable. Justly or unjustly, the integrity of a branch of the Government itself has been challenged, and it is the business of Congress to sift such charges.

In saying this, we do not wish to be understood as accepting unreservedly the accusations or intimations of Mr. Parr and Mr. Wakeman. Mr. Wakeman asserts that Secretary Gage personally insisted on his laying the evidence of the Sugar Trust's customs frauds before "my good friend, Mr. Havemeyer," and on stopping with that. This is positively denied by Mr. Gage, who replies that not only was he personally unacquainted with Mr. Havemeyer, but that no proofs of the frauds were ever submitted to him; and Mr.

Gage is a man whose word will be believed. Mr. Reynolds, whom Parr plainly insinuates to have interfered in 1904, when in charge of the customs bureau, with the secret investigation of the frauds, has made equally positive denial in his own behalf.

It is not a time to form hasty conclusions from one-sided statements; but for this very reason, it is all the more necessary that Congress should act with the utmost dispatch. That the Sugar Trust has habitually used every avenue of influence to effect its purposes at Washington, has been well known for at least fifteen years. A concern which begins its connections with the Government authorities by seducing United States Senators, as it did in 1894, into speculating in its stock at an hour when tariff legislation of great importance to the Trust was pending, and which ends by bribing obscure customs employees to install and use false scales, lies properly open to the suspicion of having grasped all other opportunities to corrupt the public service. The duty of Congress is to find out just how far these infamous practices were carried, and just how far the attitude of the Government itself, towards corporations of the sort, needs to be corrected and reformed. We are not exaggerating matters when we say that the affair stands on an equal footing of importance with the Star Route frauds and the Credit Mobilier scandal, themselves subjects of memorable Congressional investigation in their day.

Except for the dishonest dock officials, government collusion in the Sugar Trust infamies is, we say again, as yet a matter of mere allegation. We shall hope that the high officials whose names have been used will come through the inquiry unscathed. But the fact of a rotten system, and of its existence during at least three Presidential administrations, remains. The frauds continued unexposed and unpunished, despite Mr. Gage's assertion that, had he known of them, he would "have gone after the Trust with spur, saddle, and bayonet," and despite, also, Mr. Parr's own statement that, in 1904, President Roosevelt personally assured him that "he was desirous of getting evidence against the bigger criminals." What was it that held back the hand of justice, and kept things quiet at Washington when the frauds had already been discovered? It is the business of a Congressional committee to determine.

Of the incredible baseness of the conspiracy practised against the Government and against their competitors by the managers of this great corporation, there is, unfortunately, no doubt whatever. Men or corporations who make partial restitution when confronted with one set of charges, and who creep under the statute of limitations when confronted with another set, do not have to wait long for the public to make up its mind. The question of a statutory bar to one of the prosecutions, on which Judge Holt sustained the Trust's contention, and on which Attorney-General Wickersham has appealed to the Supreme Court for a final interpretation of the law, is a delicate one, which rests very largely on the language of the Anti-Trust Act itself. But a Congressional committee is bound by no statute of limitations. Its power of inquiry and investigation is supreme, and this is preëminently an occasion on which to exercise it.

THE UNEARNED INCREMENT TAX AND LAND OWNERSHIP.

Substantial taxes on the unearned increment of the value of land are a part of the British budget which is fairly certain to get itself established, whatever the result of the present controversy between Lords and Commons; and in Germany, where such levies have, for a number of years, formed part of the municipal taxation of many cities and communes, there has lately been some talk of introducing them into the imperial system. It may thus seem to the admirers of "Progress and Poverty" that, though nearly two-score years had passed without any signal advance in the principal countries of the world toward the realization of Henry George's ideals, the day is at last rapidly approaching when his dream of righteousness is to be fulfilled. How far the facts justify this view is, therefore, a lively question.

That Henry George's work, a masterpiece of propagandist writing, has been the prime mover in bringing about the change in the attitude of English and German statesmen toward the land question, cannot be denied. What had been, before the appearance of "Progress and Poverty," a question that occupied the thoughts of political economists and of a few persons specially interested in land tenure, suddenly acquired the vitality of an issue big with blessings for the whole of human kind. In the exaltation that it evoked there was, moreover, a combination almost unique of the crusading fervor for righteousness with the enthusiasm of a campaign for intellectual enlightenment. For Henry George, whatever were his economic errors in other matters, expounded with great clearness the Ricardian doctrine of rent; and any Georgite, fitted out with his master's arguments, justly felt that he knew the fundamental economics of the subject better than ninety-nine out of a hundred of those with whom he might happen to discuss it. With this union of crusading fervor and intellectual self-confidence, there has been carried on for several decades a campaign for Henry George's doctrine, which now begins to bear fruit in definite political achievement.

Yet a little consideration will show how extremely remote the results thus obtained, or in prospect, in Germany and England, are from Henry George's real object. And it is a remoteness not merely of degree, but of kind. For it is to be remembered that the distinctive point in Henry George's teaching was not the idea of the unearned increment, nor the idea of taxing the unearned increment, nor even the idea of confiscating the unearned increment. All this had been taught, so far as future unearned increments were concerned, a quarter of a century before Henry George's time, by no less authoritative an economist and publicist than John Stuart Mill. The cardinal doctrine of "Progress and Poverty" was the total confiscation of land values—not merely the confiscation of their increase after a certain time, but the confiscation of the whole thing. To accomplish this by taxation, without disturbing the title of the nominal owner, was part of the practical programme laid down by Henry George as a matter of expediency; but he did not flinch from the assertion that the result must be virtually equivalent to total confiscation. And his reasons for this position were as clear-cut as the position itself. Private ownership of land was robbery, and the hoary antiquity of the robbery could not be pleaded as an excuse—this was his ethical ground. And his reason from the

standpoint of practical effectiveness was equally emphatic; for he held that only through a great revolutionary reassumption by the people of that which belonged to them of right could the end in view be attained—*viz.*, the abolition of poverty and the consequent regeneration of mankind. It was this attitude on the question of confiscation that distinguished him from his predecessors, and especially from Mill, who was as emphatic in condemning confiscation as George was in advocating it.

Now contrast with all this the actualities. We read detailed accounts of the unearned-increment tax in Germany, and hear of its increasing popularity. But on examining the official figures in the accounts, we observe, first of all, that the total annual proceeds of the new taxes amount to 0.76 mark per head of the population of the German Empire —18 cents a year for each person. This does not look like even a beginning of the abolition of poverty. In Hamburg, the great city in which the tax seems to be heaviest, the amount is 27 cents per head annually. While the rates are very complex and differ considerably from place to place, it appears that the average amount that a landowner has to pay over is something like 15 per cent. of the increase in the value of his land, and that there are numerous exemptions. In the English budget, the proposed tax varies from 10 to 20 per cent., and here, too, there are many exemptions. Now, what does all this mean? It means that not only has Henry George's principle of confiscation been absolutely ignored, but that such taxation of unearned increment as is wholly free from ethical objection is approached with great caution on grounds of expediency. Practical consequences of the most serious kind would attend a system under which city landowners should have no share in the advance of the value of their land; such consequences are almost wholly absent when the owners get the benefit of nine-tenths or four-fifths of that advance. In a word, what we are witnessing in Germany and England is not even a remote approach to the triumph of Henry George's doctrines; it means the recognition of a certain amount of soundness in earlier teachings which were profoundly different from his own, but to which his extraordinary work gave a most powerful impetus.

HUMANITARIANISM AND CRIME.

Under the heading "Where the Golden Rule Failed," a Cleveland newspaper, a few days after the recent election, said editorially:

> "There never was a wilder election night crowd than that which choked downtown streets Tuesday night." This is the comment of an afternoon paper, and it is beyond doubt the truth.
>
> The rowdies were out in full force. They jostled and insulted women and girls. They threw snuff and pepper and daubed women's faces and gowns with grease paint and lampblack. One woman's set of white fox furs was ruined. A gang of ruffians picked young girls up and tossed them in the air.
>
> Practically the entire police force was on duty in the downtown district, but until the acts of the hoodlums became alarming nothing was done to suppress them.

In the course of an article appearing in *Hampton's Magazine* for November, part of a series under the general title, "Beating Men to Make Them Good," Mr. Charles Edward Russell gives an enthusiastic account of the working of the "Golden Rule" plan of police administration instituted by Chief Kohler of Cleveland. After citing the figures showing the great diminution of the number of arrests made in that city in the past two years, as compared with the preceding two, Mr. Russell says: "Meantime, the peace and order of the city have not been impaired; they have been furthered." The contrast between this judgment and the Cleveland papers' comment on the doings of election night affords an interesting illustration of the difficulty of ascertaining the truth of such a matter.

Further evidence of this difficulty, in the very same matter, is furnished by an article in the *Outlook*, by William J. Norton of Cleveland. Mr. Norton gives Chief Kohler great credit not only for high purpose and exceptional ability, but also for marked success in the diminution of crime in Cleveland. But he ascribes this success altogether to a part of Kohler's activity that has nothing to do with the Golden Rule policy, namely, to that policy which is described by the name of "police repression." This consists in setting so close and constant a watch on places known or suspected to be of disorderly or criminal character as to make it impossible for them to continue their nefarious business. As to the diminution in the number of arrests not accounted for in this way, a very large proportion—indeed, not very far from the whole—relates, according to Mr. Norton, to cases of drunkenness, the treatment of which under the Golden Rule plan is not radically other, but is much less efficient, than under the old plan. And he adds many other particulars reflecting unfavorably on Kohler's programme. What with this minimizing of the actual scope of the change, and what with such an allegation of failure as that quoted above in regard to election-night disorder, one is left very much at sea as to the actual merits of the case.

To determine the proper limits of the application of latter-day humanitarian ideas to any given phase of crime and lawlessness requires most careful thought and most painstaking inquiry; but there are some broad considerations which it is well steadily to bear in mind. The endeavors of those who are concerned with reclaiming the individual criminal and preventing a given delinquent from becoming a criminal through the evil associations of prison life have been productive of a large amount of good, and will be productive of vastly more in the future; but it is only natural that in their zeal for this object, reformers should run the risk of losing sight of the other, and certainly not less important, aspect of the case. This has been illustrated in a striking way in the views of the more extreme advocates of the indeterminate-sentence plan. Proposed as a means of dealing efficiently with a wide range of offences—possibly with the great majority of them—it has weighty reasons in its favor; erected into a principle, it lays itself open to objections that are not only grave, but vital. Just as soon as its advocates represent it as inherently and absolutely sound, while the old plan is inherently and absolutely vicious, it ceases to be a plan resting on considerations of practical expediency, and becomes a dogma, the acceptance of which would change fundamentally the whole attitude of men toward crime and responsibility. "To sentence a man to prison for a fixed term," they say, "is as insane as it would be to send a sick man to a hospital for a fixed term." To take this position is not only to forget that the primary object of the imprisonment is the deterring of others from crime by the fear of punishment; it strikes much deeper than this. Far more efficacious even than the explicit fear of punishment is the habitual association of the

idea of disgrace with the idea of crime, an association which cannot fail to be attenuated if we deliberately adopt the view that there is no distinction between criminality and physical disease.

On one phase of the movement to reduce to a minimum the range of the evil effects of prison association there is no room for difference of opinion. The segregation and special treatment of youthful culprits, and great care and consideration in the handling of first offenders, cannot be too strongly insisted on; and the development of the probation system is one of the most beneficent of recent advances. There is need for much amelioration of the condition of prisoners, and little call for exhortation to greater rigor. But it is none the less right to hold fast that which is good, while clearing away that which is evil; and however grave the faults and abuses, and even the cruelties and injuries of existing systems of criminal administration, it would be an error, and a mischievous error, to suppose that the fundamental idea of them is a delusion. What avoidable evils they have done to those caught in the meshes of the law it may be possible to exhibit; what evil they may have prevented by keeping the weak or the vicious from yielding to unlawful propensities is quite beyond discovery or computation.

COUNTRY LIFE PROBLEMS.

Ex-Secretary Garfield, in an address at the Young Men's Christian Association dinner last week, dealt with the failing attractions of country life, especially life on the farm. As a member of the Country Life Commission, he referred to recent investigations and said that they pointed to increasing "stagnation and decline" in rural regions, upon which the cities still exercise their vast power of suction. President Taft touched upon the subject in one of his recent speeches in the South. Admitting the evils, he was, characteristically, more sanguine than Mr. Garfield. In the President's opinion, country life is in the way of being made so fascinating that it may soon reassert its old place in our civilization, and check the seemingly irresistible drift to the city. "The suburban electric railroads," said Mr. Taft, "the telephone, the rural postal delivery, inventions, and coöperative arrangements are reaching such a point that it soon will become, I trust, more comfortable to live in the country than in the city."

There is truth in this view, but there is also fallacy. Increasing conveniences do, indeed, make country life more tolerable to those who feel themselves condemned to it, but is there any evidence that these new and extending facilities operate to hold on the farm the young men who are burning to get away from it? The telephone in the remote country-side is unquestionably a great blessing. With a service made relatively cheap by the use of party-lines, it brings the distant farmhouse into instant touch with physician and shopkeeper and postmaster. It also makes possible a daily interchange of neighborhood gossip and a frequent meeting of friends which are, in many sections, giving a wholly new cast to the social side of life in the country. All this must be recognized thankfully, yet the doubt remains whether such civilizing inventions do or can keep down that persistent and growing distaste for life on the farm of which ex-Secretary Garfield spoke so regretfully. Because the boy in a New Hampshire farmhouse can telephone to the nearest village, is he the less likely to slip away to Boston to get a job as motorman? We know of no statistics bearing on the point, yet the fact that farms continue to be abandoned, and that the city keeps on pulling to itself country-bred youth, would seem to argue that neither telephone nor trolley nor the daily newspaper left in the mail-box by the roadside will suddenly make thousands of men and women fall in love with the country which now they hate.

As a matter of fact, it may be plausibly argued that the very introduction in the country of a modicum of urban comforts and conveniences merely whets the longing for the city. Sir Horace Plunkett, who for twenty years has been a close student of agricultural conditions in Ireland and in the United States, is distinctly of the mind that the thing actually works in that way. The trolley car passing once an hour simply renders the appeal of subway and elevated and the two-minute headway all the stronger. The farm telephone is very good, but how if it puts into the youth's head a still more vivid conception of the charm of a great city knit together in the enjoyment of every modern facility? What possible chance has the newspaper which reaches the farm in the evening, or a day late, of competing in excitement with the city editions appearing clamorously all day long and far into the night? Sir Horace Plunkett soberly concludes that the trend to the cities has actually been heightened, not diminished, by giving the country a fuller taste of urban pleasures and conveniences. Having got a small part, the country folk desire the whole, more than ever. Careful inquiry should be directed to ascertaining whether this is really the fact.

For so deep a social disturbance as the steady forsaking of country life by those who can escape it, remedies that go deep are obviously necessary. And they will have to be felt by the masses rather than presented by the rural "uplifters." Causes both economic and social must get powerfully in operation before we shall see the beginnings of the desired effect. The argument from material well-being seems already to be slowly making headway. Historically, the flight from the country to the city was at first a part of the industrial revolution of the last century. The great factories, the more numerous jobs, were in urban communities, and farm workers, with those whose house-industries had been destroyed by machinery and specialization, went to the towns to find work. It may be that a reaction will set in, also for economic reasons. The struggle for existence may drive people back to the land. With farming made easier and more scientific and profitable, the terrible pressure in cities may soon begin to extrude to country districts many who must seek a new environment and opportunity if they are to maintain themselves above want or beggary. Until some such solid advantages, or social necessities, can be made the rural set-off to the artificial charm of the city, it will be in vain to hope for a re-population of deserted hillsides. To reinforce the economic argument by every appeal on the score of health and sentiment is, of course, an obvious duty. Nothing that can be done to improve country schools, or to promote human intercourse among scattered farmers, should be omitted. And it might well be hoped that a change of mental attitude could be brought about, so that men and women would again associate their happiest experiences with country sights and sounds, and have such remembered thrills of pleasure as

stirred De Quincey when he recalled his joy, as a child, at the blossoming of the crocuses in his father's garden.

RACINE AND THE ANTI-ROMANTIC REACTION.

I.

Since the flickering out of symbolism a few years ago, there has been a singular dearth of fresh initiative in French literature. The French themselves do not seem sure whether the present is merely a period of pause before the starting of some new movement, or whether they are definitively entering the stage of Alexandrian impotence. Even the novel, the literary form that flourished above all others in the last century, is showing signs of exhaustion. When I inquired of a distinguished Frenchman last year as to the outlook for the novel, he simply replied: *C'est fini.* Meanwhile, amidst the existing lassitude, we may note curious symptoms of dissatisfaction with the nineteenth century, and its aftermath in art and literature. It was in France, in the writings of Rousseau, that certain romantic and naturalistic points of view first found powerful expression. It is in France, the most intellectually sensitive of modern nations, that we now see the beginnings of reaction against the fundamental postulates of Rousseauism. Few books have been more talked about of late than M. Lasserre's brilliant and virulent attack on French romanticism.* Rousseau is not merely an ancestor of romanticism, according to M. Lasserre, he is a complete embodiment of it; and Rousseauism M. Lasserre defines as an "integral corruption of the higher parts of human nature." If M. Lasserre's opinion of Victor Hugo in particular is to gain currency, the worshippers of Hugo have done well to make haste and celebrate the fiftieth anniversary of the "Légende des siècles," for by the time of the hundredth anniversary the glory of Hugo will have become a mere memory, like that of Ronsard in the seventeenth century.

It is not, however, M. Lasserre's attitude toward this or that author that is chiefly significant. As he himself says in the preface to one of the later editions of his book, his aim is not so much to attack the romantic and naturalistic movement in its flowers and fruit, as to pour a little poison about its roots. Unfortunately, M. Lasserre's book tends to be extreme, and, in the French sense, reactionary. A year or so ago I chanced to be strolling along one of the narrow streets that skirt the Quartier Saint-Germain, and came on a book-shop entirely devoted to reactionary literature: and there in the window, along with books recommending the restoration of the monarchy, was the volume of M. Lasserre, and other anti-romantic publications.* Now, I for one regret that a legitimate protest against certain tendencies of nineteenth-century life and literature should be thus mixed up with what we may very well deem an impossible political and religious reaction.

II.

My purpose is not, however, to discuss M. Lasserre, but a topic suggested by another book that belongs to the same anti-romantic movement, a book that has likewise been much talked about and gone through many editions. The volume in which the most gifted of living French critics, M. Jules Lemaître, exalts Racine† is a natural pendent to the volume in which he recently attacked Rousseau. In the case of the lectures that went to the making of both volumes, there was the same rolling of fashionable equipages in front of the Salle de Géographie on the Boulevard Saint-Germain. But in spite of the applause of the dowagers of the *beau quartier*, the "Racine" is a successful book, far more than the "Rousseau," partly, perhaps, because the author is more at home with art than with ideas. In defending tradition no one ever got farther than M. Lemaître from the dryly traditional. There is, indeed, something rarely entertaining in all this impressionistic trepidation of style, devoted to the praise of an age and author that are supposed above all to have been decorous and conventional.

M. Lemaître has a love of Racine that admits of few doubts and reservations. He would agree with Boileau, who put his friend's plays on a level with those of Sophocles, or with Voltaire in the following century, who declared that "Athalie" is the "masterpiece of the human spirit." The romanticists, to be sure, rose in revolt against Racine; but if Racine is now coming into such high favor again, it is partly, says M. Lemaître, as a reaction against *le mensonge et l'illusion romantiques.* And he goes on to praise Racine in a way that is itself more suggestive of the romantic ardor than of the classical coolness of temper.

For example, he says that "Racine unites and fuses in himself the two fairest traditions of our humanity: the Hellenic and the Christian." We should say, on the contrary, that though Racine united in himself these two traditions, it is of the utmost importance to add that he did not entirely succeed in fusing them. We may doubt whether the seventeenth century in general was fully successful in its attempt to reconcile the two great disciplines it had inherited from the past. Thus, Boileau's theory of the epic implies that in the ordinary relations of life a man should be a Christian, but when he sits down at his writing-desk, a pagan; and this can scarcely be regarded as satisfying. Now Racine had likewise been trained in the "two antiquities," classical and Christian, but he differed from nearly all the other writers of his time in having a thorough knowledge of Greek as well as of Latin—a knowledge that ranges from the Attic tragedians to the late pastoral romances; his Christianity, again, was not of the somewhat easy-going and Jesuitical type that was current in his century; but, as a youth, he had been steeped in the severe and ascetic faith of Port-Royal. In short, he had been initiated into an unusually pure form of the two great traditions, and the result was an inevitable conflict, not only within himself, but with the outer world. Of a noble and dignified presence, and perfect in all the accomplishments of the *honnête homme*, Racine was fitted to be the ideal courtier. His Jansenism alone stood in the way; for it was his Jansenism, and not the more or less mythical petition that he presented to Louis XIV in behalf of the suffering common people that led to his partial fall from favor at court, and is supposed to have hastened his end. It was not again so much the efforts of his enemies against "Phèdre," as the struggle between the humanistic elements in his training and the reawakening scruples of his Jansenist boyhood and youth that caused him at the age of thirty-seven, and in the full maturity of his powers, to renounce the writing of plays. The attitude of the Jansenists toward the stage, we should recollect, was very similar to that of the Puritans in England. Just as the Puritans called the theatres the "devil's chapels," so the Jansenist Nicole denounced playwrights as "poisoners not of the bodies, but of the souls of the faithful."

Joubert says that the talent of Racine is in his works, but Racine himself is not there. We may, at least, say that, in spite of "Athalie," Racine failed to express fully his religious side in his plays, differing in this respect from dramatists like Sophocles and Æschylus, who were conscious of no such opposition between the sacred and the profane, for whom the drama, indeed, so far from being under the ban of religion, was closely associated with it. Possibly this is one reason why we do not get in Racine, in spite of his extraordinary mastery of the psychology of the passions, any equivalent for those passages in which Æschylus and Sophocles seem to sound the very depth of human destiny.

III.

Most of us would reproach M. Le-

Le Romantisme français. Par Pierre Lasserre, 1907.

*The books that M. Ernest Seillière is writing against romanticism (*Le Mal romantique, etc.*) are less specifically reactionary. M. Seillière is a disciple of the philosopher Fouillée.

†*Jean Racine.* Par Jules Lemaître. 1908.

maître less for the romantic and impressionistic bent he betrays even in his classicism than for his failure to adjust his treatment of Racine to the international point of view. This is indeed a grave defect, though it is not, like the same defect in the volume on Rousseau, fatal. M. Lemaître's own reason for dismissing so lightly the international verdict on Racine is very simple: There is, he says, in Racine a something that is forever inaccessible to foreigners. It is no doubt because of this inaccessible something that the gap between the native and the foreign estimate of Racine is wider perhaps than in the case of any other French author. We must note, for example, the almost entire failure of any translation or adaptation of Racine to gain a foothold on the English stage or in English literature; so much so that a recent French writer, after reviewing this record of failure, decides that *les Anglais n'ont pas la tête racinienne.* In Germany, Lessing objected to Racine for not being sufficiently classical; A. W. Schlegel objected to him for not being sufficiently romantic, and examples might be multiplied to prove that the German head is at least as un-Racinian as that of the Englishman.

Now, what the cultivated Frenchman admires in Racine, according to M. Lemaître, is reason, exquisite measure, supreme clearness, delicate sensibility tempered by judgment—in brief, the truly classical virtues. What the foreigner objects to, on the other hand, may be summed up in the word artificiality, a pervading suggestion of the somewhat hollow pomp and grandiosity of the court of Louis XIV—an element, in short, that is pseudo-classic rather than truly classical.

If we are to arrive then at an intelligent estimate of Racine, it should seem necessary, above all, to determine in what respects he is genuinely classic and in what respects neo-classic or pseudo-classic, not failing to note at the same time certain other respects in which he is inspired rather by the spirit of romance.

The neo-classic element in French tragedy goes back, of course, to the Aristotelian commentators and literary casuists of the Italian Renaissance. Perhaps the most striking feature of this neo-classical regulation of the drama from the very start is its tendency to apply rational rather than imaginative standards, even to the point of abolishing the distinction between the world of poetry and the world of logic and every-day fact. Any play that overstepped the bounds of ordinary reality or failed to develop with a strict logical sequence was condemned as "improbable." This somewhat narrow and mechanical conception of dramatic verisimilitude is mainly responsible for the most famous of all the rules, the unities of time, place, and action, of which the second is not in Aristotle at all, and only the third can be said to be truly Aristotelian. The three unities, along with the *liaison des scènes* (the "scenes unbroken"), another expression of the demand for logicality, have been summed up in the lapidary verses of Boileau:

> Qu'en un lieu, qu'en un jour un seul fait accompli
> Tienne jusqu'à la fin le théâtre rempli.

Unlike Corneille, Racine moved with perfect ease among all the rules that the neo-classic disciplinarians had imposed upon the stage. Indeed, it is in Racine, if anywhere, that all this regulating of the drama must find its justification. From a minute study of treatises like that of Heinsius, ("De Tragœdiæ Constitutione," 1611), he absorbed the quintessence of the Aristotelian lore of the Renaissance. As a result, he has attained in several of his plays, not simply a strictness of structure, but an actual perfection of dramatic technique that is unsurpassed in ancient or modern literature; and this is no mean merit, even though it does not in itself take the place of the divine spontaneity of Greek art at its best.

The neo-classic rules fell in with Racine's own tendency to concentrate—to portray only one passion and to take that passion itself in its very crisis and culmination. Racine is more interested in the psychological drama than in the outer action in which this drama finds expression. A recent writer (G. Michaut in "La Bérénice de Racine," 1907) has maintained that the most Racinian of Racine's plays—the play toward which his whole conception of dramatic art tended—is "Bérénice," which comes near realizing the popular notion of French tragedy as a five-act conversation. Yet the psychological drama in "Bérénice" is intense, and it is a better acting play than many a romantic melodrama crowded from beginning to end with tumultuous incident. It is also to Racine's concentration that we must ascribe in part his lack of "local color," all the concrete and picturesque details that diversify human beings in time and space, a lack for which he has been reproached by critics from his contemporary Saint-Evremond to the present day. Like all the classicists, Racine aimed to represent human nature in its essence rather than as locally modified, but was often too prone to identify this essential human nature with forms of human nature peculiar to his own time. "The French poets," says Dryden, "are generally accused that wheresoever they lay the scene, or in whatsoever age, the manners of their heroes are wholly French. Racine's Bajazet is bred at Constantinople; but his civilities are conveyed to him by some secret passage from Versailles into the Seraglio." At all events, Racine had the virtues of his limitations and did not allow himself to be diverted from the real business of the drama to the pursuit of the local color that was the fetich of the romanticists of 1830, and that M. Lemaître has attacked so amusingly.

IV.

One of the ways in which the neo-classic writer becomes pseudo-classic is by failing to distinguish between the permanent laws of good taste and what Lowell calls the parochial by-laws of etiquette. The ancients, says Lessing, knew nothing about politeness. Seventeenth-century French tragedy, on the contrary, is permeated by a refined social convention; and Racine, who was at once an accomplished humanist and a perfect courtier, was peculiarly fitted to achieve this fusion of the standards of the classicist and the standards of Versailles. The distinction between the polite and the vulgar is all-pervasive in his plays, from the chief characters who must be of a certain rank to the language which must be free from all plebeian taint. It has been said that Plato and the fishwives of Athens used the same vocabulary. At all events, words were not officially classified at Athens as "noble" or "low," and the same is, of course, true of Elizabethan England. In commenting on the first scene of "Hamlet," Voltaire is especially shocked that a mouse should dare to stir in tragedy. Exact comparison is not easy, but we may estimate that the ideas of dignity and decorum of his time restricted Racine to a vocabulary less than one-half the size of Shakespeare's. From the charmed circle of convention in which French tragedy moves, everything harshly realistic is banished. Its personages seem to feed on nectar and ambrosia. Little is said about the mind's action on the body, virtually nothing of the action of the body on the mind.

Racine was, of course, too good a classical scholar not to be aware of the difference in this respect between his own art and that of the ancients. He knew that if the art of the ancients was fastidious and selective, it was not squeamish. "In our French poetry and even in our novels," he writes, "there is no more talk of eating than if the heroes were gods who were not subject to the need of nourishment, whereas Homer sets his heroes to eating on every occasion." The "Odyssey" especially, we may add, is remarkable for the amount of eating and drinking it contains (the "eating poem of the 'Odyssey' " as Fielding called it); so much so that when Odysseus would raise the spirits of the departed, he offers them the ghostly equivalent of a good dinner.

"This over-delicacy of the French," Racine concludes, "is a genuine weak-

ness." To understand how French society and literature came to move in this world of refined convention, we must, of course, go back to the beginning of the seventeenth century and the growing influence of women and the drawing-rooms at that time. We should note especially that the men and women who gathered about Mme. de Rambouillet deliberately patterned themselves upon the heroes and heroines of the great literary success of the period, Honoré d'Urfé's interminable pastoral romance, "l'Astrée." The *grand monde*, as conceived by Mme. de Rambouillet and her group, is a curious transformation of the pastoral dream that, in some form or other, has always haunted the human heart. "So understood," says Amiel, "society is a form of poetry; the cultivated classes deliberately recompose the idyll of the past and the buried world of Astræa." In entering a seventeenth century drawing-room one entered an intensely artificial Arcadia, but an Arcadia none the less, from which the cares and concerns of ordinary life were banished and where one was free to discourse of love. This discourse of love, it is true, often ran into mere *préciosité*, into what has been termed wire-drawn and super-subtilized gallantry; but at the same time a great deal of real insight into the passions resulted from all this anatomizing of the heart.

Now the tragedies of Racine have been influenced in a marked degree by this love-making of high society. The young lovers of his plays—his Alexander and even his Pyrrhus—are first cousins to the pastoral youth (who are at the same time fine ladies and gentlemen) that sigh and languish through the numerous volumes of d'Urfé and his imitators. Racine, as we have said, was familiar with the Greek pastoral romances and had even met in one of them the very situation he afterwards developed in "Phèdre." But love in the Greek pastoral is something very different from that of the French drawing-room. If the ancients knew nothing about politeness, they likewise knew very little about gallantry. Love as understood by the *précieux* and *précieuses* goes back to the Petrarchian refinements of the Italian Renaissance, which can, in turn, be traced to Petrarch himself, and ultimately to the cult of the "lady" and the courts of love of the Middle Ages. The strenuously classical Rymer complains that the French will still be off on "the wild goose chase of romance," and it is true that Racine's preoccupation with love as the supreme motive is romantic, rather than classical. At times, his presentation of love is not only romantic, but chivalric and mediæval. The sole object of his Alexander in conquering the world is that he may lay his conquest at his lady's feet. Pyrrhus tells Andromache that as a result of her fair glances, he is burned by more flames than he ever lit in Troy. In "Phèdre," Racine has altered the whole sense of the ancient legend, by making Hippolytus sigh for the charms of Aricia. "Where the poet ought," says Dryden, "to have preserved the character as it was delivered to us by antiquity, when he should have given us the picture of a rough young man, of the Amazonian strain, a jolly huntsman, and both by his profession and his early rising, a mortal enemy to love, he has chosen to give him the turn of gallantry, sent him to travel from Athens to Paris, and transformed the Hippolytus of Euripides into Monsieur Hippolyte."

V.

We must not, however, dwell too long on the element of artificiality and convention in Racine. It is, after all, more or less superficial. What we most often find when we get beneath the somewhat over-decorous surface of his Alexandrines is the keenest psychology and the severest realism. There is less that is far-fetched and fantastic, less of *préciosité* in his treatment of love than in Corneille's. At his best he utterly transcends the Arcadian affectations of the drawing-rooms. So much so that to these drawing-rooms themselves he seemed violent and even ferocious. There is more truth in this opinion than in the opposite charge of tameness which is often brought against him by foreigners. Racine is preëminent among the dramatists of the world for the mingled power and delicacy with which he has portrayed nearly all the aspects of love, from the mere refinements of gallantry to the ground-swell of elemental passion—passion that in "Phèdre" especially is heightened and intensified by Christian remorse:

Hélas! du crime affreux dont la honte me suit
Jamais mon triste cœur n'a recueilll le fruit.

We may learn from Racine what we have tended too much to forget since the romantic triumph, that the expression of emotion may be intense and at the same time restrained.

We may conclude, then, that foreign indifference to Racine arises in part from legitimate dislike of the pseudo-classic element in his work, but even more perhaps from failure to do justice to his genuinely classical virtues. For example, the attitude of seventeenth-century England toward Racine was due not so much to a loftier and less conventional view of the drama as to a crude romanticism. The very public that was indifferent to Racine applauded "heroic plays" inspired by the bombast and preposterous gallantries of inferior French writers like La Calprenède and Scudéry; just as many persons to-day may be counted on to prefer the rant and fustian of Hugo's "Hernani" to the exquisite art of plays like "Athalie" and "Phèdre." The average Englishman or American is apt to see proof of his imaginative superiority in a failure to appreciate Racine; in nine cases out of ten it is proof rather of a limitation.

There is special reason just now why we should overcome such limitations and refresh in ourselves the sense of the sound classical virtues. M. Lemaître therefore does us a service in treating with such an easy and unaffected grace a writer who had a number of these virtues, and in not only feeling himself, but making others feel that he is dealing with something vivid and vital. M. Lasserre also does us a service by his plea for a humanistic revival. The need of such a revival should be evident to every one. With the spread of impressionism, literature has lost standards and discipline and at the same time virility and seriousness; it has fallen into the hands of æsthetes and dilettantes, the last effete representatives of romanticism, who have proved utterly unequal to the task of maintaining its great traditions against the scientific positivists. At the same time, if there is to be a humanistic movement, we may hope that it will be somewhat less negative and more genuinely constructive than the one M. Lasserre and others are trying to start in France; that it will preserve, even in its severest questionings of the nineteenth century, a certain balance and moderation, a certain breadth of knowledge and sympathy, and so seem an advance and not a retrogression.

Cambridge, Mass.

NEWS FOR BIBLIOPHILES.

The second part of the Maier library will occupy the Anderson Auction Company four sessions, afternoon and evening, November 22 and 23. The first editions of Longfellow (101 lots) include "Outre Mer" (1833-34), the two parts, in original covers, uncut, a fine copy; "Poems on Slavery" (1842), two copies; "The Spanish Student" (1843); "The Belfry of Bruges" (1846), with autograph verses inserted; and "Evangeline" (1847); besides several presentation copies of other books.

The first editions of Lowell, the most extensive collection ever offered (125 lots), includes about all the rarities: "Harvardiana" (1837-38), in parts; "Class Poem" (1838); "A Year's Life" (1841); "The Pioneer" (1843), the three parts in the original covers; "Poems" (1844), one copy on large paper, another on small paper, but a presentation copy and in the original boards uncut; "Ode recited at the Commemoration of the Living and Dead Soldiers of Harvard University" (1865); and "Poems of Maria Lowell" (1855), a presentation copy from Lowell to J. E. Cabot, with a manuscript poem in Mrs. Lowell's autograph inserted.

The Poe collection includes the two most

valuable books in the library. "Al Aaraaf, Tamerlane, and Minor Poems" (1829), Poe's second book, is the copy given by Poe to his cousin Elizabeth, with his autograph presentation inscription. When Poe came to reprint his early poems in the "Raven" volume in 1845, he had again obtained possession of this volume and had made numerous manuscript alterations on the margins. The book was broken up and used as printers' copy, the typesetters names "Richard" and "Moran" being written on the leaves. The Catalogue states that these alterations were made for the "Poems" printed in 1831, but this is a mistake. The book first turned up in the auction room in the sale of George H. Moore's library at Bangs's in May, 1893. It was next owned by William Nelson of Paterson, New Jersey, and, being kept in his safe, was one of the few books in his library preserved during the great Paterson fire. It was, however, charred, and the leaves made very brittle. In this condition it was sold in the Harold Peirce sale in Philadelphia in May, 1903, bringing $1,825. The purchaser sent it to Bradstreet's and the leaves were sized and put back into the old covers. The paper is still browned, but is firm and usable and the book is one of the most interesting Poe items known.

Another important Poe item is that thin pamphlet without title, but with cover, "The Prose Romances of Edgar A. Poe . . . No. 1. Containing the Murders in the Rue Morgue, and the Man that was Used Up," Philadelphia: . . . 1843," which was picked up for a few cents in Dutchess County in 1906, and for which Mr. Maier paid about $1,500. The only copy ever sold at auction brought $1,000, at the F. W. French sale in 1901. Poe's letter, dated June 4, 1842, to Dr. Snodgrass, offering his story "The Mystery of Marie Roget" for publication in the Baltimore *Visiter* for forty dollars, is also in the Maier collection. It is printed in full for the first time in the catalogue, and is one of the most interesting Poe letters extant. On the same day, Poe wrote to George Roberts, offering the same story for publication in the *Mammoth Notion*, but the price named in that letter is fifty dollars. The Roberts letter sold in the French sale in 1901, and is now in F. R. Halsey's collection.

The Whittier collection (137 lots) includes most of the rarities, among them "Legends of New England" (1831); "Moll Pitcher" (1832); "Mogg Megone" (1836); the privately printed poem "Sumner" (1872), with manuscript corrections by the author and others.

This second part includes also first editions of the writings of Joaquin Miller, D. G. Mitchell, S. Weir Mitchell, J. L. Motley, John Neal, Thomas W. Parsons, J. K. Paulding, John Howard Payne, William Gilmore Simms, Charles Dudley Warner, and other authors, together with an extensive series of American magazines.

On November 22, 23, and 24, the Merwin Clayton Sales Company will sell a portion of the scientific books of William L. Sherwood of New York. This is the most important scientific collection, especially in books on botany, which has been dispersed at auction in recent years. Clayton's "Flora Virginica" (1762); Marshall's "Arbustrum Americanum" (1785); W. P. C. Barton's "Flora of North America" (1821), with colored plates, and Gray's "Genera of the Plants of the United States" (1848), with colored plates by Isaac Sprague, are included; besides other works by Barton, Gray, Candolle, Chapman, Sowerby, Nuttall, and other writers, as well as extensive series of scientific periodicals and a quantity of manuscripts by William Darlington. On November 26, the same house will sell a collection containing a complete set to date of the *New England Historical and Genealogical Register*, Savage's "Genealogical Dictionary," and other works on American genealogy; Thompson's "History of Long Island," the first edition of 1839, as well as the more valuable second edition in two volumes, published in 1843; books on Connecticut, etc.

On November 23 and 24, Libbie & Company of Boston will sell the library of Fred M. Bixby of Brockton, Mass., and other consignments of miscellaneous books.

On December 13, 14, 15, and 16, Sotheby, Wilkinson & Hodge will sell the library of the late William Wheeler Smith of New York. Included are several Books of Hours of the Fourteenth and Fifteenth Centurics; specimens of the work of several of the early Continental printers, and an imperfect copy of Higden's "Polychronicon," printed by Caxton; a series of the various editions of the Dances of Death and of the Emblems of Alciatus, and a number of works on the history of printing.

Correspondence.

GETTYSBURG.

To the Editor of The Nation:

Sir: Hosts of your readers, doubtless, feel indebted to you for the extended notice given in your issue of October 30 to the story of Gettysburg, as told by the heroic Haskell, as well as for your discerning comments made on the notable phases of that campaign. Perhaps it may be admissible to call attention to the tributes paid at the time to the officer in question by his commanders, indicating that the example set by him in the critical moment of the battle exerted a matchless influence. For instance, Major-Gen. Hancock, commanding the Second Corps, in his official report of the battle, says:

> I desire particularly to refer to the services of a gallant young officer, First Lieut. F. A. Haskell, aide-de-camp to Brigadier-Gen. Gibbon, who at a critical period of the battle, when the contending forces were but fifty or sixty yards apart, believing that an example was necessary, and ready to sacrifice his life, rode between the contending lines with the view of giving encouragement to ours, and leading it forward, he being at that moment the only mounted officer in a similar position.

Brigadier-Gen. Gibbon, commander of the Second Division of the Second Corps at this period of the battle, testifies similarly, to his exertions as does Col. Hall of the Seventh Michigan, commanding the Third Brigade of this division.

There were, of course, hosts of men at Gettysburg just as gallant, just as skilful, just as loyal, as this officer. The opportunity, however, came to him in the very crisis of the battle, when the destinies of the struggle were trembling in the balance, to see what needed to be done; and his glorious example was one of the agencies used to make victory sure. The fact that he had clarity of vision to recognize the needs of that moment, and the self-forgetful courage to swing himself into the deadly breach, is the salient matter to be emphasized.

Possibly I may be permitted to say something on the point raised by your review in regard to the non-delivery by Meade of a counter-stroke after the repulse of Pickett. You intimate briefly that a "disordered Confederate retreat" opened the opportunity for such a blow, and that "the world has come to feel that Meade's caution was untimely, and that the war was thereby sadly prolonged." It should be remembered that there was actually no "retreat" except that made by a very small body of men—the broken remnants of Pickett's command—not more than two thousand altogether, who had escaped slaughter or capture. Lee's entire line of battle was unbroken. Fifty thousand men stood in line, in a strong position, with a hundred and forty cannon, so planted as to sweep the plain across which a counter-blow must be aimed. "It would have been stark madness," says Gen. Hunt, chief of artillery on the Union side in that battle, "to have made an advance under the circumstances." With a single exception all the foreign military experts who were with Lee, studying the operations of the campaign, have testified that there was but little sign of demoralization on the return of Pickett's remnant, and they have recorded their conviction that an assault by the Union forces would have been repulsed with heavy losses. Longstreet, Hill, and other Confederate officers in command in the battle have written on the subject, declaring that they were abundantly ready to meet a counter-stroke, and that they "would have liked nothing better" than the opportunity which a Union advance would have afforded them. Is it a clear case, then, and can it be urged that "the world" has wisely made up its mind, that Meade's proper course was to direct or lead his army forward against Lee's unbroken lines, across the very plain which had been made the scene of the annihilation of Pickett's command?

The old question as to Meade's faultiness in not making an attack on Lee at Williamsport, Maryland, after Gettysburg, is also raised in the review. The testimony of Major-Gen. Humphreys, great as an engineer, a strategist, and leader on the field, and reckoned by good judges to possess as large resources of varied military knowledge and ability as any man in the Union army, ought to help to decide this matter. Lee occupied at Williamsport a line which could not be flanked on either side, and which Humphreys, who had attempted to carry by successive charges the heights of Fredericksburg, declared was stronger than that held there by the Confederates, and even stronger than Meade's position at Gettysburg. The deliberate judgment of Humphreys, put on record after he had surveyed the field, and considered all the facts, years after the close of the war, was that an assault by Meade upon Lee's entrenched position at Williamsport "would have resulted disastrously." So far as I have been able to apprehend the case, those who have studied the whole situation most closely have reach-

ed the conclusion that an assault would have resulted as did the butchery at Cold Harbor. Swinton's comment, in his "Twelve Decisive Battles of the War," made after careful research, is worth citing:

It is certain that Lee wished to be attacked at Williamsport, and if it be a cardinal maxim of war never to do what the enemy desires you to do, it may appear that there are at least two sides to the question.

As to Meade's generalship, we may recall what Gen. Hunt, chief of artillery, said, after long study, given to the campaign, and after having had unusual opportunity to see it at large from army headquarters: "As I have studied this battle, Meade has grown and grown upon me."

The selection of Pipe Creek as a tentative line of battle—a very strong location—was made in view of the possibility that Lee would turn from the Susquehanna down toward Baltimore and Washington—not as a final place in which to give battle. Recall the situation: On Sunday morning, June 28, Meade was placed in command; seventy-two hours later, the battle opened, but by his alertness and skill, Meade was able to concentrate his forces at Gettysburg in time to meet the army of Lee, as it arrived.

It can hardly be claimed that those who seek for grounds on which to base their belief in the supreme greatness of Lee as a general, will find the material in the Gettysburg campaign. The plan itself was hardly wise; an invasion of the North was sure to solidify and thoroughly arouse the border States, and, indeed, all the Union elements. Lee could not reasonably hope to pass by the flank of the Army of the Potomac and reach Washington without a battle; while any serious scheme aimed at Philadelphia, if cherished at all, must now be deemed a delusion and a snare. The consent, which Lee gave to "Jeb" Stuart to take his cavalry and go a-cavorting between the Army of the Potomac and Washington and the failure to keep any cavalry for use on the right flank of the advancing Confederate army constituted a double-blunder, with fatal consequences. In the direct management of the forces at Gettysburg, surely no one will claim that Lee showed his usual skill. Had he pressed his advantage on the first day, and crowded after the retreating Union forces on that dreadful Wednesday afternoon, July 1, it is barely possible that Cemetery Hill might have been taken; that chance was thrown away. The line of battle which Lee chose and occupied, was a most disadvantageous one—seven miles in length, and enclosing in concave shape, the inner, compact Union line, which was correspondingly advantageous. With a single exception, no attack was made at any point with sufficient force to make an impression. At not a single point was the Union line indented, except at Culp's Hill on Thursday night, July 2, and from this point the Confederates were driven next morning. The crowning blunder of all was in ordering Pickett's attack. Even if thirty thousand troops, instead of six thousand, had been massed for that assault, it could not have penetrated the Union lines. The position was well-nigh impregnable; scores of guns were massed on the ridge, commanding the entire field of advance; and the assault at that particular point had been foreseen by Meade and amply provided for.

Longstreet had in mind a movement which had in it just then the possibility of success—a move on the part of Lee southward, a short distance, such as would threaten the communications with Frederick and Washington. In such a case the Union force would have been drawn out of its stronghold and made to fight for its lines in the rear. Lee gave the suggestion scant consideration. The comment made upon the Charge of the Light Brigade applies with equal force to Pickett's movement: "That is magnificent, but it is not war!"

An inside view of the feelings of some of Lee's officers as to the conduct of the battle is afforded by Gen. Wade Hampton, writing from Charlottesville, Va., July 15, 1863, under treatment on account of wounds received at Gettysburg, to Senator Wigfall, at Richmond:

Our army is in good condition after its terrible and useless battle. . . . We could better have stormed the heights of Stafford than those of Gettysburg.

On the other hand, can one find a single tactical mistake made by Meade? As to the whole case, the judgment of Humphreys is worth emphasizing. In his memorial address, delivered November 18, 1872, he said:

After a careful examination of the subject, I am led to the conclusion that Meade at Gettysburg had a more difficult task than Wellington at Waterloo, and performed it equally well, although he had no Blücher to turn the scale in his favor.

JESSE BOWMAN YOUNG.

Jacksonville, Fla., November 9.

ST. AUGUSTINE ON THE SUFFRAGETTES

To the Editor of The Nation:

SIR: There appear to be few who credit St. Augustine with any but the narrowest sense of humor, and fewer still who recall that in his "De Civitate Dei" (xviii, 9) he has sketched with lively amusement the *suffragatrix,* or suffragette of ancient Athens. He is recounting the story Varro tells about the contest for the naming of Athens, whether it should be from the goddess Athene (or Minerva), or from the god Neptune. The passage runs as follows, in Healey's clever version:

Hereupon Cecrops gathered all the people of both sexes together (for then it was a custom in that place to call the women unto consultations also), to give their voices in this election, the men being for Neptune and the women for Minerva; and the women, being more, won the day for Minerva. At this, Neptune, being angry, overflowed all the Athenians' lands (for the devils may draw the waters which way they list), and to appease him the Athenian women had a triple penalty set on their heads. First, they must never hereafter have a vote in council; second, never hereafter, be called Athenians; third, nor ever leave their name unto their children. Thus this ancient and goodly city, the only mother of arts and learned inventions, the glory and lustre of Greece, by a scoff of the devils, in a contention of their gods and male and female, and by a feminine victory obtained by women, was enstyled Athens, after the female's name that was victor, Minerva; and yet being plagued by him that was conquered, was compelled to punish the means of the victor's victory, and showed that it feared Neptune's waters worse than Minerva's arms.

Neptune, the mean male that he was, of course threw cold water on the whole business, and "to appease him" the Athenian suffragettes were robbed of their right to vote, to be called Athenians, and to leave their names to their sons. Deplorably disastrous as the outcome proved, is it not nevertheless somewhat reprehensible that St. Augustine, no doubt with a man's prejudices, failed to enlarge on the importance of the fact that, in one respect at least, the suffragettes conquered? They had the "last word"; for their vote naming the city Athens stood unrevoked to St. Augustine's day—and stands unrevoked in ours.

THE PHLEGMATIC COMPLEXION.

To the Editor of The Nation:

SIR: An allusion made by Moth in "Love's Labour's Lost," I, ii, 81-89, has not yet, so far as I know, been fully explained, although Halliwell was on the right track. The passage in question reads:

Moth.—A woman, master.
Armado.—Of what complexion?
Moth.—Of all four, or three, or two, or one of the four.
Arm.—Tell me precisely of what complexion.
Moth.—Of the sea-water green, sir.
Arm.—Is that one of the four complexions?
Moth.—As I have read, sir; and the best of them, too.

Halliwell wrote, "Moth does not lay claim to scientific accuracy. The colors assigned to the four complexions . . . are thus noted in Sir John Harington's 'Englishman's Doctor, or the School of Salerne' (1608):

The watry flegmatique are fayre and white;
The collericke, more red; the melancholy,
Alluding to their name, are swart and colly."

Dr. Furness in the "New Variorum" points out that Moth could not have read a book that appeared in 1608. Mr. H. C. Hart in the "Arden edition" says: "Halliwell endeavoured to show that Moth assigned colors to the four 'medical humors.' I think he is merely chattering."

The title of the work cited by Halliwell gives a sufficient clue to one old authority for associating specific colors with the four temperaments. In the "Conservandæ Bonæ Valetudinis Præcepta," or "Regimen Sanitatis Salernitanum," written about 1100 for Robert, Duke of Normandy, we read (edition by Dr. John Ordronaux, 1870) that a person of the sanguine temperament is "rubei coloris"; of the choleric temperament "crocei coloris"; one of the phlegmatic temperament has "facie color albus," and one of the melancholy temperament is "lutei coloris" (opp. 116-117). By way of summary the poem continues:

Hi sunt humores qui præstant cuique colores.
Omnibus in rebus ex phlegmate fit color albus.
Sanguine fit rubeus; colera rubea quoque rufus.
Corporibus fuscum bilis dat nigra colorem.

Dr. Ordronaux gives (p. 132) an extract from an English translation extant in a MS. dated 1575.

But though the precepts of the school of Salerno afford an early authority for the four complexions, they have nothing to say of the "sea-water green." This apparently comes from the "Kalender of Shepherdes," of which there were numerous editions from 1506 on, listed by Dr. Sommer in his reprint (1892). I quote from Pynson's edition of 1506, as reprinted by Sommer (III, 145-146):

Here foloweth of the foure complexyons. The coleryke . . . of all coloures they loue gray. The sanguyne . . . desyres gownys of hy colowre. The flematyke man

. . . ioueth grene coiowre. The maiyncoly . . . iouythe gownys of black coiowre.

The "Kalender" is a translation of the French "Compost et Kalendrier des Bergiers," first published in 1493, whose compiler was apparently acquainted with the "Regimen Sanitatis." Dr. Sommer mentions (i, 96) MS. Sloane 636 as containing a passage on the four complexions similar to that in the "Kalender." Possibly similar passages occur in Caxton's "Governal of Health" and in Elyot's "Castel of Helth," which I have no opportunity of consulting.

It is plain that while Moth is not "scientifically exact," he has some excuse for calling green one of the four complexions, and is justified in referring to the authority of books. The "Kalender" was so frequently reprinted in the sixteenth century that there is at least no great improbability in supposing this to have been the book that Shakespeare had in mind.

BEAUTIFUL WRITING.

To the Editor of The Nation:

Sir: In the treasure room of the library of Harvard University there are now on view the greetings received from other institutions of learning, on the recent occasion of the inauguration of a new president. These are in the form either of broadsides on vellum, parchment, or paper, or of several sheets more or less permanently enclosed within covers. A few are printed from type, but the majority are the work of the calligrapher's pen, and are decorated with rubricated or illuminated initials, seals, arms, or other devices.

Coming as they do from all parts of this continent, and from several foreign countries, they may perhaps be considered as fairly representative specimens of the present status (in America at least) of the art of writing, and it is to be noted with regret that almost without excepion they exemplify the deplorably low level to which that once beautiful art has fallen.

Most of them, to speak accurately, are not written at all, but consist of careful arrangements of drawn letters, devoid of beauty either in individual characters or in general effect. Some follow German models with such unrestrained exuberance of flourish as to be quite undecipherable. Many are content to reproduce the appearance of the ugly, conventionally engraved, collegiate diploma; still others waver between painful imitations of printed characters and rustic block letters of no recognizable origin; while a number perpetuate the absurd flowing Spencerian hand of our copybook days, frequently in startling combination with the blackest of Old English text.

The decoration, if not always in irreproachable taste, is, as a rule, well executed and frequently delightful in color and arrangement; but the lettering, with few exceptions, is so wholly lacking in coherency and style as to render the term calligraphy, *i. e.*, beautiful writing, a sad misnomer.

Now, there is such a thing as fine writing done in this very decade, and criticism of this present display would be gratuitous did it not call attention to the development of a living modern school of calligraphy among a few men and women in England.

Some little time ago, inspired perhaps by the revived interest in the art of printing, several men turned their attention seriously to the study of fine Italian manuscripts, contemporary with the birth of the newer art in that country. Working quietly for ten years or more and with little heralding of results, they have nevertheless produced in that time numerous addresses, testimonials, and charming little books written in modern adaptations of the beautiful late fifteenth century Roman hand.

These books and addresses are not drawn, but veritably written, and depend largely upon that quality for their beauty. Decoration wherever admitted has been kept properly subordinate to the writing, yet in harmony with it. Several excellent manuals with admirable illustrations of processes and examples have been published, and in England the art of writing seems well on its way to at least a partial restoration to its former eminence among the graphic arts.

It is to be hoped that our calligraphers, both professional and amateur, will speedily familiarize themselves with what is done abroad. It may be thought that in this era of haste the leisurely art of writing, as a minister only to the tastes of the dilettante and wealthy collector, has slight claim to serious consideration. It is perhaps true that the world is too old and too poor to buy beautifully written books, and it is quite true that it is futile to attempt reproducion of their charm by any process of mechanical multiplication; but the prediction might well be made that the perfection of a style of beautiful writing would speedily manifest its influence upon the design of our printing types, and would inevitably result in the development of a school of beautiful printing, as it did in the fifteenth century.

A UNIVERSITY CLUB.

To the Editor of The Nation:

Sir: I cannot refrain from applauding your criticism of the recent article of President Wilson, embodied in your editorial of October 28. Since graduation, nearly twenty years ago, my associates, business and social, in Pittsburgh, have been, in most part, alumni of our various colleges, and I have been troubled by the very prevalent lack of interest among them in general culture. Their University Club, supposedly composed of the cultured intelligence of the city, is, in large part, a centre for indulgence in games and the pleasures of the table, and is absolutely negligible as an intellectual force in the community. The framed seals of various colleges hanging upon its walls are a sign that it draws its membership exclusively from men holding degrees; but as it exercises no other functions reminiscent of college days than the occasional alumni dinner and "smoker," and the special-wire service for bulletining the scores of the leading intercollegiate football and baseball games in season, it shows that, while the purely social and athletic features of college life survive, the hiatus between it and university culture is no narrow one. And yet the graduates of Princeton predominate in numbers over the representatives of any other institution in this organization. Is there not room for a conscientious belief that the college must bear a part of the responsibility for the existence of such conditions? Has the college training of most of these graduates not been inefficient at some point? To my mind comes the irresistible conclusion that the university is not very far above the trade-school when it fails to invest those whom it sends out from its walls with a lasting zest for culture. If our colleges do not give this permanent inspiration, surely their value and usefulness are sadly crippled; the finer and better elements of life will be neglected, and our society will become wholly industrial and commercial.

SWEETNESS AND LIGHT.

To the Editor of The Nation:

Sir: Swift's dictum about the bees as purveyors of honey and wax, which gave to Matthew Arnold his famous phrase, finds a curiously interesting anticipation in the fourteenth century *Voir Dit* of Guillaume de Machault. The lines, in which the poet addresses his lady, are these:

> Trop bien vous puis comparer sanz mesdire
> A la mousche qui porte miel et cire.
> Le mel est dous et le sur à lui tire
> Et l'adoucist, homs nel puet contredire.
> . . . Et la cire art
> Qui alume le monde, main et tart,
> Plus que ne fait du tonnoirre l'espart.

The familiar passage from "The Battle of the Books" is as follows:

> Instead of dirt and poison we have rather chose to fill our hives with honey and wax, thus furnishing mankind with the two noblest of things, which are sweetness and light.

The parallel (which happens to be much closer than that with the phrase from Lucian which Craik notes) is, of course, fortuitous. But one wonders if the two passages may not possibly have a common source.

GREEN EYES.

To the Editor of The Nation:

Sir: In one of the oldest and finest versions of the Sleeping Beauty story, contained in the first book of the fourth part of "Florisel de Niquea" (Salamanca, 1551), the Princess Darcaria falls asleep with her attendants at the sound of the harp of her lover Arfiles, and continues so for six years till Prince Rogel comes to rescue them. On seeing the Prince, Don Arfiles says to him: "Do not give her peace (kiss her) to wake her, or you will put me in a state of war." But the prince takes the harp and begins to play, and when Arfiles falls asleep, he kneels before the princess in order to wake her with a kiss. She opens her beautiful green eyes, saying: "Are you going to commit an act of disloyalty?" and falls asleep again.

Literature.

MODERN AUSTRIA-HUNGARY.

Austria-Hungary. By Geoffrey Drage. With maps. New York: E. P. Dutton & Co. $6 net.

Hungary of To-day. By members of the Hungarian Government, etc. Edited by Percy Alden, M.P.; with numerous illustrations. New York: Brentano's. $3 net.

Time was when English readers in search of information concerning the Hapsburg monarchy turned to the leisurely pages of Coxe's "House of Austria" or the picturesque descriptions of Kohl's "Austria" and Patterson's "The Magyars." Works of this kind have long been superseded by the condensed recitals of Austria's past in the "Stories of the Nations" series and by the more or less accurate glimpses of Austrian "Town and Country Life" given in another uniformly patterned group of volumes. These, in turn, are now making way for handbooks dealing with recent political and economic evolution, with trade statistics taking the place once filled by scenic charms and tales of vanished days. With books of this sort, which reflect the universal interest in the practical questions of to-day, may be classed the two volumes before us. They both claim attention as being written with a serious purpose, by well-informed observers familiar, often at first hand, with actual conditions in Austria-Hungary.

Mr. Drage, who has a long list of official British reports on labor and kindred topics to his credit, has packed into the present volume a large amount of information, such as one expects to find in the "Statesman's Year-Book," together with various historical and political summaries—the whole being presented under the general head of "Austrian Affairs," "Hungarian Affairs," and "Common Affairs." The author's sources of information are, as a rule, well chosen, though one is surprised to see among them the "Historian's History of the World," and to find too much space given to passing newspaper opinions.

The modern method of basing political forecasts on the outcome of economic problems is well illustrated by Mr. Drage's treatment of the annexation of Bosnia-Herzegovina by Austria—an event which has seriously disturbed her trade relations with the Balkan States. Both Austria and Hungary, who had formerly commanded the Servian market, selling that kingdom "almost everything, from scientific instruments to rough sacks for holding plums," find their commercial supremacy in that quarter seriously threatened by Servian animosity due to the success of Count Aehrenthal's foreign policy. Trade with Montenegro is endangered by the same cause, and Turkey continues to boycott Austro-Hungarian goods. Thus the seeming triumph of Prince Eugene's dictum of two centuries ago, "Austria's future lies in the East," is jeopardized by purely commercial conditions.

Some of Mr. Drage's facts will prove suggestive to American readers, as, for instance, those relating to the growing power of the Cisleithan chambers of commerce, twenty-nine in number. Their right of initiative in the matter of tariff regulations, international commercial treaties, tax reform, patent and trade-mark bills, etc., may well furnish hints to those of us here who have learned to look hopefully to our own chambers of commerce as almost the sole protection against the vagaries of Congressional legislation. American interests are directly touched upon in the passage on emigration, where Mr. Drage points out—what is so often overlooked in the outcries on this side of the ocean against the swelling tide of Slavs and "Huns"—that the Austrian, and still more the Hungarian day laborer, rarely comes here to stay. His sojourn usually lasts from one to five years, and he returns to his native country quite content with a saving of a few hundred dollars. Of particular interest, too, are Mr. Drage's remarks concerning Austria's commercial schools, the excellence of which is attested by "the fact that the Prussian professors admit the Austrian system to be the best and are copying it."

In his chapter on "Central and Local Government" in Austria, Mr. Drage wisely follows—as he often does—Lowell's "Governments and Parties in Continental Europe." He overemphasizes, however, Lowell's language in his bald statement that "the bureaucracy is practically all-powerful, and there is a great dread of the free expression of opinion; both associations and the press are subjected to severe restriction, while the inquisitorial police vigilantly supervise the conduct of visitors and citizens alike." No one familiar with Austrian conditions will admit that the statement is correct as it stands. Lowell goes into explanatory detail as to the restriction of the press, restraint on the right of association, etc.; yet he is himself in error when he says that in Austria "every man habitually carries about his person an official certificate of his identity and good standing." What Lowell doubtless had in mind, in this statement, is the former need of producing, when called upon, a *Legitimationskarte*, for the purpose of proving one's identity. This emergency rarely arose, and the card itself is now obsolete.

The volume, as a whole, exhibits, in minor matters, and particularly in the transliteration of foreign names, many blemishes. Indeed, the author makes in his preface (forgetting, apparently, that the Hungarian language has no alphabet of its own) this really extraordinary announcement:

> No strict rule has been followed in rendering Slavonic, Magyar, or other foreign names, into English, but the translation (*sic*) which appears likely to be most familiar to English readers has in each case been chosen. Nothing would be gained by transforming the well-known names Wekerle, Goluchowski, and Kossuth, into Vekerly, Goluhofsky, and Koshoot.

Of Mr. Drage's skill in Englishing Slavonic names, "Fadejef" (for the Russian general Fadeyeff), and "Charfarjik" (for the Slavonic scholar, Schafarik), are specimens. More serious slips still are the inclusion of Troppau, the capital of Silesia, in a list of Bohemian towns (p. 540), the allusion to Siebenburgen (*sic*) as though it were not identical with Transylvania (p. 576), and the mention of "Austrian Poland *and* Galicia" (p. 540). On page 563, we read of "the Slovaks, Louis Kossuth . . . and Alexander Petöfi," which is about as correct as it would be to speak of the Celts Gladstone and Lord Byron. There are numerous errors in the spelling of Hungarian towns, "Tiza Ezlar" for Tisza Eszlár—of infamous anti-Semitic memory—being a sample of a frequently recurring mistake. More annoying still is the interlarding of the text with French phrases, borrowed from the books consulted by the author.

Percy Alden's "Hungary of To-day" follows the precedent set by Villari's excellent work on "The Balkan Question," in offering a symposium of various authorities. The volume derives, indeed, a unique distinction from its list of contributors, which includes the principal members of the Wekerle Cabinet. Count Albert Apponyi, Minister of Public Instruction, discusses "The Hungarian Constitution"; Antal Günther, Minister of Justice, "Law and Justice"; Francis Kossuth, Minister of Commerce, "Industrial Labor Legislation"; and the Premier himself, Alexander Wekerle, 'Taxation Reform." All these articles are valuable in themselves and testify, in the aggregate, to an amount of solid information and skill in imparting it such as few cabinets anywhere at the present day can boast of. Count Apponyi's contribution, moreover, glows with that patriotic *élan* which, from time immemorial, has characterized the productions of Hungarian publicists. A striking passage reveals not only the fervor of the Hungarian patriot, but the self-restraint of the Minister of the Crown. Count Apponyi thus pictures the attitude of the Magyars during the period of their greatest trial:

> From this time (1825) until 1848 the Constitution works about normally. It is the golden age of our political history, the epoch of our great national renaissance. The institutions were incomplete and badly secured, but great men arose, in whose hands this defective machinery produced wonders: orators, statesmen, economists,

philosophers, savants, poets, and littérateurs joined hands in communicating to the national life a splendor and vigor it had never known since the days of Matthias Corvinus. This grand epoch ended with the reforms of 1848, which—creating Hungarian democracy—gave to our old Constitution the new strength of Parliamentary forms. But these magnificent results were engulfed in a catastrophe of which I may not relate the details. Be it far from me, the thought of lifting even a corner of the veil which our gracious sovereign and the nation have with one accord cast over the unhappy events of that time.

Not only Hungary, but Cisleithania, it may be added, had her "golden age," while groaning under Francis's paternal despotism, Ferdinand's good-natured incapacity, and Metternich's brutal censorship. If Hungary cherishes the memory of her Count Széchenyi, Baron Eötvös, Vörösmarty, and Arany, Austria points with equal pride to her Count Anton Auersperg ("Anastasius Grün"), Baron Feuchtersleben, Grillparzer, and Lenau. But Count Apponyi is justified in claiming for the Hungarian lower nobility—the "noble democracy," as it has been termed—an undisputed prëemience in its many acts of self-renunciation. It remains to be seen whether it will be willing to part with its remaining privileges, when the extension of the suffrage, now before the Hungarian nation, becomes a burning question.

Percy Alden, the editor of the volume, who is known for his interest in settlement work, contributes an interesting paper on "The State Child," which explains in detail the work of the nation in caring for its neglected children. The whole of Hungary is divided into seventeen districts, in each of which there is a State Children's Refuge. In these asylums there were housed on January 1, 1908, 35,242 children. Each district has a Children's Law Court, concerned not so much, as in England, with the trial of youthful offenders, but with the permanent guardianship of every child. The career of each is followed up by these courts. Not more than about 5 per cent. remain in the refuge; the others are boarded out in specially organized children's colonies, provided with all educational and sanitary appliances. Two hundred and thirty-eight of these village colonies are now in existence. It ought to be added that this state paternalism has had only a beneficial effect on the poor. There is no tendency to hand over children needlessly to the state, and the number of illegitimate births has decreased, as has the death-rate among children cared for by the state, as compared with the mortality among others. Thus, in one of the most important of all social problems, Hungary, in Mr. Alden's language, "leads the way and sets an example to Western nations."

It would be interesting, did space permit, to speak in detail of the equally praiseworthy efforts of the present Minister of Agriculture, Dr. Daranyi, to improve the lot of the small farmer and agricultural laborer. His endeavors have resulted in a system of old-age pensions, in the building of houses for agricultural laborers, in the establishment of about 2,000 reading clubs, and in schools devoted to such special subjects as poultry and bee-keeping, afforestation, dairy farming, wool-sorting, etc. More than 2,000 local coöperative banks, nearly 1,000 coöperative stores, and 700 coöperative dairies afford unusual credit and purchasing facilities. Of Prof. Zsolt Beöthy's article on "The Intellectual Life of Hungary," which betrays a somewhat strained effort to conceal the barrenness of modern Hungarian literature, as compared with the glories of the past, we can only say that it exalts the prosy "Tragedy of Man" of the dramatist Madách as having "ascended the highest heights of poetic philosophy." A chapter on "Hungarian Music," by Julius Káldy, modestly informs the world that "recently Julius Káldy, with his works . . . has aroused much enthusiasm."

The accuracy of the volume in the matter of Hungarian accents and other respects (the Danube is spoken of as the largest river in Europe) is not all that might be desired, and, as in so many books on Hungarian subjects, the average foreign reader is puzzled by the Magyar names of places which are much better known by other appellations. Few Austrians even recognize Strigonia as Gran, Kassa as Kaschau, and Szabadka as Maria-Theresiopel. The numerous illustrations, with the exception of the half-tone portraits of the members of the Wekerle Cabinet, do not add much to the interest of Mr. Alden's volume.

CURRENT FICTION.

A Reaping. By E. F. Benson. New York: Doubleday, Page & Co.

The diary-tale continues to hold its own as a popular variant from the narrative form of fiction. You open the book with some misgiving, perhaps. What if it should turn out to be nothing but a real diary, a record of thoughts and happenings as crudely arranged by nature, without sequence or ending? The first pages of "A Reaping" have an ominous look. Reflections on the foibles of the amateur invalid, on the mystical function of the musical conductor, on silence, record-making, lovers by the Serpentine, motor-bus antics, and what-not: one saving hint alone in connection with a dinner-neighbor from whom you feel that you are to hear again shortly. It is enough: you are reassured. There is meaning in the entrance of the dinner-lady; this is no mooning diarist you have to deal with, but a story-teller who knows what he is about. Presently you are rewarded by presentation to the other persons: Helen, the wife of the pseudo-diarist, and a youth known as "Legs." Helen is a bride of a few years, lovely and lovable, childless thus far, but wistful of motherhood. "Legs" is just out of the university and on the edge of the diplomatic service, a first cousin of the Helen's husband. He is "a fanatic on the subject of life," the embodiment of young ardor, a most engaging and real person. The story connected with these people is, after all, reducible to very small terms. The dinner-lady dies (as it is known that she must from the outset), "Legs" sees her ghost, and he himself dies within the year. Not very long after his death Helen becomes a mother. These are the outward events; but the chief thing, after all, is the inward experience of the young pair after the death of "Legs"—a peculiarly Bensonian experience. This Mr. Benson differs in many ways from his brothers, the priest and the don, but he has in common with them an immense curiosity as to the phenomena of death.

The Oath of Allegiance. By Elizabeth Stuart Phelps. Boston: Houghton Mifflin Co.

Jonathan and David. By Elizabeth Stuart Phelps. New York: Harper & Bros.

It is always a little hard to speak of the fresh work of a veteran and inveterate story-teller like Mrs. Phelps Ward. In her case, the task is especially difficult for the commentator of middle age, who recalls her with some tenderness as a light unto a favorite path of his sentimental youth. What if Miss Alcott were still writing of her little women, her "roses in bloom"? Would it now seem to us who grow old that her later work was inferior, while the real fault lay with ourselves? Mrs. Ward is a dozen years younger than Miss Alcott would be if she were alive now; but her fiction belongs to the same school, and, we may fairly say, to the same period of unabashed sensibility. How long ago was it that a Miss Phelps of Andover was making us cry with her "Gates Ajar"? No doubt, she is still making people cry. Her method has not changed, any more than Bret Harte's changed; her later product is more nearly equal to her earlier than his was. The chief difference, perhaps, lies in the ranking quality of her audience. The most enlightened class of readers no longer inclines, if it has tears, to shed them over the obvious. Woe as a luxury has gone down in the social scale.

These later stories are not without their modern touches. Similes are built upon the "X-ray" and the aeroplane. But the material, with its little touches of modern dress, is the old material. There is always the appeal to sympathy from weakness: the pathos of childhood,

maidenhood, spinsterhood, senility, caninity. Two of the stories in "The Oath of Allegiance" volume, however, "His Soul to Keep" and "A Sacrament," are of fresher and deeper quality. The title story represents Mrs. Ward's sentiment at its most strained.

"Jonathan and David," a short story, printed by itself, as a holiday booklet, is the tale of an indigent old gentleman and his utterly impossible dog. It should be greeted with enthusiasm by admirers of "Loveliness."

Northern Lights. By Gilbert Parker. New York: Harper & Bros.

If the reader is at first inclined to attribute the mediocrity of these tales to the slackening hand of a writer to whom his art has ceased to be a first object, or to the careless hand of a writer grown too sure of his audience, a second glance will probably suggest another reason. They bear the ear-marks of 'prentice work. They play stiffly upon the strings of popular sentiment; they exhibit the life of the frontier in its obvious aspects, and especially as offering a rugged scene for the enforcement of the familiar lessons of love, duty, sacrifice, and valor which form the respectable stock in trade of the magazine romancer. In short, it seems pretty clear that Sir Gilbert has been persuaded to exhume these specimens of his early work for commercial reasons.

The "Note" prefixed to the volume does not, to be sure, suggest such a possibility. It merely announces that the tales belong in substance to "two different epochs in the life of the Far West"—the period before and the period after the entrance of the Canadian Northwest by the railroads and the Mounted Police. The implication would be that the book might be supposed to offer some sort of original commentary upon life in the Northwest during those periods. As a matter of fact, the substance of the tales is commonplace. They are pretty good stories, and touched with local color: pioneers freeze their feet on long solitary journeys—Indians starve in their winter camps—the brave pioneer girl is everywhere in evidence as the rescuer of the derelict pioneer man—the reprieve of the hero wrongfully condemned comes just in time. The stories are not dull, they are as good as the ordinary specimen of their *genre*. The honest tribute we can offer their creator is our surprise and disappointment that they are in no way better than that.

Other People's Houses. By E. B. Dewing. New York: The Macmillan Co.

This is an acute study—acute at times to the point of painfulness—of a phase of life especially aggressive in our own time, but peculiar to no single period. The looker-on at life, the dweller in other people's houses, is a familiar figure both in fiction and in fact. It is possible, however, to wear the rue with a difference, and the author has chosen to strike the despondent chord rather than to emphasize the note of high courage to which the melody of these incomplete lives is so often keyed. For this very reason, it may be, Emily Stedman is not quite convincing, in spite of the abundance of personal detail which, according to long precedent, is supposed to endow a character with vital force. The story deals with parti-colored skeins of affection, much tangled; in the endeavor to imbue the reader's mind with the atmosphere of the tale, the writer has obtained an excessive effect of confusion. The scene shifts so rapidly that one's mental vision is left with that sense of blurred weariness produced in the physical by a cinematograph. This, however, may be the result of literary immaturity, as there is an underlying power in the book that definitely conveys a promise of better things.

THE STUDY OF HISTORY.

Historical Evidence. By the Rev. H. B. George, M.A., Fellow of New College. Oxford: The Clarendon Press.

When in 1860 Charles Kingsley was inaugurated professor of modern history in the University of Cambridge, he delivered an address upon the limits of exact science as applied to history. Instead of formulating the principles governing the use of historical evidence, he defended in vague and grand epithets the action of moral law and spiritual agencies in the world of human life. It is a far cry from the defensive attitude of the famous preacher and lecturer in 1860 to the historian's calm acceptance to-day of the scientific approach, and it is a noteworthy fact that it was Buckle, a representative of the group that Kingsley so vigorously attacked, who popularized belief in the possibility of applying scientific treatment to historical problems. In truth, scientific criticism, like science itself, is deemed no longer hostile to religious belief, and this truism finds ample support in the fact that the work here under review, which is our most recent exposition of scientific historical criticism, is written by a clergyman of the Church of England.

Criticism as applied to historical sources of information is as old as Petrarch, but the raising of such criticism to the rank of a scientific pursuit is a very modern matter. No general treatise on the subject was published until 1889, and even to-day there is no manual in English that deals in a comprehensive way with all classes of historical knowledge. The present work is, therefore, doubly welcome, for it not only supplies an adequate statement of the leading principles governing the treatment of evidence, but it is presented with so much sanity and good judgment as to commend itself heartily to any one concerned with the writing of history. Its author is a veteran, well known for more works than one, and notably for a treatise on the relations of geography and history and for an authoritative account of Napoleon's invasion of Russia. As a clear, well-balanced statement of the scope and limitations of criticism as applied to historical evidence, it has no superior; in its moderation and freedom from exaggerated pretensions, it will serve as a corrective of some modern notions regarding the attainment of scientific certainty in historical knowledge.

To the author, as to many another competent historian, historical criticism is nothing more than common sense systematically and logically applied. But it is the common sense of the trained scholar, not that of the man in the street. The instinct for wise and sound criticism is born of wide knowledge and tried experience. It is true that some men are born critics, as were Julien Havet in France and Prof. E. G. Bourne in this country; but the majority of men have the necessity of criticism thrust upon them. To those who become critics by training, such a work as this will be indispensable, and in the hands of the beginner it is bound to exercise a profound influence. Every prospective doctor of philosophy in history should ponder it well. Within its field the range is a broad one. The author first defines evidence in law, science, and history, and determines wherein historical evidence differs from legal evidence and from that available for the exact sciences. He then considers the various sources of historical information, the nature of historical narratives, the defects of historical writers, the characteristics of documents not narrative, and the value of indirect sources—physical, geographical, archæological, and the like. He closes with chapters on probability, on special sources of error, and on certain rules governing historical generalizations.

Mr. George furnishes, however, no categorical canons, such as may be found in Rhomberg's series of historical axioms. In general, he avoids sharp distinctions and subtle analyses such as characterize the German treatises. This absence of precise formulæ gives to the work a certain inarticulate character which to some scholars may seem a defect. To the present reviewer this want of precision seems one of the best features of the book, for historical evidence cannot be marshalled under rules that operate like the axioms in geometry. Mr. George has handled each subject with caution and his views stand in striking contrast with the assertions, often extreme and unwarranted, to be found in the "Etudes Historiques" of Langlois and Seignobos. We can recom-

mend his manual as the best possible guide for the nascent historian, whether professional or amateur, and even historians of an older growth may profit by its perusal.

The White Stone. By Anatole France. Translation by Charles E. Roche. New York: John Lane Co. $2.

Like several other of M. France's books, "The White Stone" is an attempt to produce something charming as romance, veracious as history, and more philosophical than either. Obviously composed on the spur of a half-dozen different impulses, it is intended as a whole to illustrate two theses: the one, the deciduousness of civilizations; the other, the impossibility of predicting what the future will bring forth. The loose connection of its parts betrays the author's characteristic indolence and a certain ennui or disdain of the rigor of literary forms and conventions. It begins with the light archæological ruminations of a group of Frenchmen trifling with ashy urns and crumbling skeletons as they sit toward evening among the disinterred ruins of the Roman Forum. At a suggestion from the master of the excavations, Nicole Langelier, a transparent disguise for Anatole France, pulls out his manuscript and reads his story of Gallio, pro-consul of Achaia under the Emperor Claudius. This story takes the form of a protracted conversation in which Gallio and his friends are made to speak for the various opinions held by enlightened men upon the religious and philosophical topics of their day. The point of the piece—the utter inability of these cultivated Romans to foresee the successor of Jupiter—is artfully brought out by representing the trial of a repulsive fanatic called Paul and the stoning of a wretch called Stephen as disagreeable but entirely insignificant interruptions—insignificant even to the children hard by who, "weary of pursuing Stephanas, were playing at knuckle bones by the roadside." The reading of the story concluded, Langelier and his companions discuss its historical accuracy, incidentally revealing the fact that their own ideas have much more in common with those of Gallio than with those of Stephen and Paul. Over a good dinner, the talk of the Frenchmen drifts leisurely along through philosophy and religion to politics and the Japanese-Russian war and on into the future, which is imaginatively surveyed in a Utopian tale of the federation of the world through the triumph of the socialists. But, mindful of the fatuity of Gallio's circle, M. France discreetly names this tale "Through the Horn or the Ivory Gate."

A brief introduction informing the reader, among other things, that "The White Stone" was published in its original form ("Sur la Pierre Blanche") in 1905, that it shows in some measure the influence of a sojourn in the tents of the socialists, that a portion of its comment on the Eastern situation was delivered before a great concourse of socialists in 1904—such an introduction would contribute to the interest and comprehension of the reader who is making his acquaintance with Anatole France through the medium of the translated works, of which this is a part. It must be said, furthermore, that Mr. Roche's translation suffers by comparison with—we will not mention the original, but other volumes in this edition. Apparently attempting to be very literal, he rather frequently misses not merely the subtlety but even the simplicity of the French, and makes his English harsh upon the tongue. Fancy, for example, M. France misplacing two words in a sentence like this: "Alone the religion which only tolerates itself, cannot be endured," or "Alone are the Jews ignorant of the providence of the gods." Another error twice repeated is the use of "similar" for "like," *e. g.*, "a Jupiter whose head of hair, similar to the flower of the hyacinth, drops uncrowned——." Sometimes the rendering is naïve like a college freshman's—for instance, "the ancient one" (p. 78) for "the old fellow" or "the old codger." Sometimes rare or archaic words—"agrestic," "spumous," "wot"—destroy the harmony of the style. There are even a few peculiar spellings—the French form "Zenon" for "Zeno," "forgerer" for "forger," "androginous" for "androgynous," and "delimitated" for "delimited." It is not thus that one should treat a classic.

Round the Lake Country. By the Rev. H. D. Rawnsley. New York: The Macmillan Co. $1.50 net.

Canon Rawnsley conforms here strictly to the title of his book. He offers a group of twelve papers on places which lie just outside the region of the English Lakes. He carries the reader down the Cumberland coast from St. Bees to Cartmel in Lancashire, and again from Penrith to Bampton, northeast of the high fells. If, as Wordsworth figured them, in his "Guide to the Lakes," the vales be regarded as spokes of a wheel, the hub being a peak, long ago worn down by erosion, between Scafell and Helvellyn, Canon Rawnsley in these sketches has traversed about half the tire. He has done well in calling attention to the great antiquarian wealth of the narrow strip of land between the mountains and the sea. But he does not always succeed in making the adventures of his British and Saxon saints as real to the reader as they evidently are to him. And his explanation of the Gosforth Cross and the so-called Beowulf Stone as Christian applications of pagan mythology is anything but convincing.

He is happier in the vivid picture of a Westmoreland horse-fair of to-day, and in the story of Hogarth's uncle, the local satirist of Troutbeck, or, again, where he retells, largely in her own stout words, the tale of the Countess Anne, a seventeenth-century worthy.

After all, what would rune-stones and pre-Norman crosses amount to, if they could be deciphered to everybody's satisfaction? The interesting thing is that they exist in that corner of England where almost every old place-name speaks of the Norsemen. In Roman camps and roads, Druid circles, Saxon assembly mounds, dateless barrows, and equally mysterious church customs, such as the rush-bearing, but especially in local words of Norse origin, the region described by Canon Rawnsley is very rich. Though of less value, no doubt, than his "Literary Associations of the English Lakes," this book should be pleasant reading for leisurely folk who like to go on imaginary journeys, maps in hand.

Notes.

"Time's Laughing-Stocks, and Other Poems" is the title of a volume of verse by Thomas Hardy, to be published through the Macmillan Co.

Prof. Albert Feuillerat's monograph on John Lyly is announced for issue early in 1910, through the Cambridge University Press. The same scholar's edition of the complete works of Sidney, also to be published by the Cambridge Press, will soon make its appearance, the first volume being promised for Easter.

T. Fisher Unwin (London) is publishing, in "Life in an English Village," by Maud F. Davies, a study of the country parish which may be likened to Mr. Rowntree's "Poverty"—the study of the working classes in York. The population of a scattered Wiltshire village of 800 inhabitants is analyzed, and tabulated under such headings as occupations, earnings, incomes, and character. The social, economic, and domestic habits of the people are observed, and an attempt is made to trace their migrations for four generations.

Contemporary interest in Lord Byron is not confined to English writers, it should seem. In France has just appeared, besides Albert du Bois's drama, "L'Aristocrate," of which the poet is the hero, a popular biography by Mme. A. Séché and J. Bertrant, in which Byron's memory is defended against the slanders of Harriet Beecher Stowe.

The Grolier Club is celebrating the bicentenary of the birth of Samuel Johnson by an exhibition of one hundred and seventy-five portraits of him, and a remarkable collection of first editions. Some of the volumes came from his own library, others bear the author's presentation inscriptions. There is, too, the original manuscript of Mme. Piozzi's "Anecdotes of

the Late Samuel Johnson," opened at a pago on which is given the following interesting explanation of the great doctor's big words:

His mind was so comprehensive that no language but that he used would have expressed its contents, and so ponderous was his language that sentiments less lofty and less solid than his were would have been encumbered, not adorned, by it. Mr. Johnson was not intentionally, however, a pompous conversor, and though he was accused of using big words, as they are called, it was only when little ones would not express his meaning as clearly, or when perhaps the elevation of the thought would have been disgraced by a dress less superb.

The great dictionary, a copy of which Becky Sharp so rudely spurned, lies open at "pension," with its famous definition of "an allowance made to any one without an equivalent." Among the portraits of Johnson shown are engravings from the many painted by Sir Joshua Reynolds, and there is a mezzotint of "Bozzie"; but a number of Johnson's friends whom we would have liked to meet, notably Beauclerk, Goldsmith, the Piozzis, and Fanny Burney, are absent.

Another posthumous writing of Francis Thompson is to be offered by Burns & Oates (London) in his "Life of St. Ignatius Loyola." The book will be abundantly illustrated.

The Manchester University Press announces for early issue a series of studies by Dr. Phoebe Sheavyn, called "The Literary Profession in the Elizabethan Age," dealing with the conditions of authorship under Elizabeth and James I, and the possibility of earning a livelihood by literary work during that period.

Hard upon the publication of his "Last Poems," Charles Scribner's Sons announce the early issue of a volume of "Poems Written in Early Youth," by George Meredith.

Dr. James Morris Whiton is the author of "Interludes: In a Time of Change—Ethical, Social, and Theological," a restatement of old theological positions. The book will be issued through Thos. Whittaker.

A new volume of essays by J. Brierley will be published by the same house under the title, "Aspects of the Spiritual."

Prof. E. D. Fite of Yale has written a study of "Social and Industrial Conditions in the North During the Civil War," which is announced for early publication by the Macmillan Co.

On Houghton Mifflin Co.'s list of books for immediate publication, we note a holiday edition of Henry James's "Italian Hours," with thirty-two full-page illustrations in color by Joseph Pennell; "Warriors of Old Japan, and Other Stories," by Yei Osaki, illustrated by Japanese artists and with a sketch of the author's life by Mrs. Hugh Frazer, and John W. Foster's "Diplomatic Memoirs," in two octavo volumes.

Economic essays submitted in competition for the prizes of $2,000 offered by Hart, Schaffner & Marx should be addressed to Prof. James Laurence Laughlin of the University of Chicago before June 1, 1910.

The first volume of Aylmer Maude's biography of Tolstoy, issued by Messrs. Constable, dealt with the first fifty years of the Russian's life; the second volume, promised for the coming winter, will bring the record down to the present day. Mr. Maude is at present visiting the subject of his biography in Russia; and the Countess Tolstoy is reading the Life carefully before publication to ensure accuracy.

Harry Whitney, who has spent two years hunting in the Arctic regions, and who has accompanied both Dr. Cook and Commander Peary in their travels, is to tell his experiences in the Northland in a book which we hope will appear before all our interest in these matters is dissipated. His collection of photographs is said to be one of the best ever brought out of the Far North.

An association styled "les Amis de Balzac" has been formed in Paris, to buy the house in which the novelist died, and in which he lived for the last six or seven years of his life. With the annual subscriptions paid into the society's treasury by members, the house has been rented, and a museum is now being arranged, containing souvenirs of Balzac. The house is a one-storied building, with a garden, situated in a quiet, somewhat unfrequented quarter of the capital.

A year ago (November 5, 1908) we published an exhaustive estimate of the poetry of Eugene Lee-Hamilton, and now we have only to record the publication (Duffield) in beautiful form, with ten additional sonnets, of the sonnet sequence in memory of his daughter. "Mimma Bella" seems to us to rank with the more important English elegies. Until now it has been accessible, in greatly abridged form, only in the *Fortnightly Review*. The present edition has a portrait of the author and a brief biographical introduction by his widow. We will enrich the page with one of these fine sonnets, the eighth:

Where Mimma lies, some nameless children sleep,
Whose graves in the obliterating grass
Sink slowly, as the empty seasons pass,
And look like waves on Time's slow-heaving deep.

No tears, no flowers; save when spring-clouds weep
Upon them, or the breeze with faint "Alas!"
Brings them stray petals from the flowery mass
Upon some grave that Love and Sorrow keep.

Who were they? No one knows. But theirs this wreath
Of fourteen herries, that a stranger brings
With blossoms for his child that sleeps beneath.

For Life, their names are faint forgotten things;
But now within the larger book of Death,
Their names are written with the names of kings.

Miss Constance Hill has taken as her own the anecdotal history of Fanny Burney, Jane Austen, and the other literary ladies of the late eighteenth and early nineteenth centuries, and her books, with the charming illustrations from the sketches of Miss Ellen G. Hill, have been among the pleasantest of the kind in recent years. Now she makes a volume out of "Maria Edgeworth and Her Circle in the Days of Buonaparte and Bourbon" (John Lane & Co.). The title is taken from the chapters which tell of Miss Edgeworth's visits to Paris in the shifting days of empire and monarchy, but the story is by no means confined to France. London also comes into view, with glimpses of Mrs. Barbauld, Joanna Baillie, the Miss Berrys, and other twinkling lights, chiefly feminine. Miss Hill draws on letters preserved by the Edgeworth family and hitherto unpublished, but the interest of her work is due to her sprightliness more than to any novelty of material. The book is scarcely as entertaining as her "Juniper Hall" and "House in St. Martin's Street," owing to the fact that the unity of place in those earlier volumes kept her from that scattering of effects which is always the temptation of the anecdotal writer.

"Scenes from Every Land," second series, is a collection of 250 pictures, most of which have appeared in the *National Geographic Magazine* during the past few years. They give vivid impressions of human and animal life in savage and semi-civilized countries and of some wonderful mountain scenery. The most interesting, linking ancient with modern times, shows the inauguration of the Damascus to Mecca Railway at Tebuk by sacrificing sheep. A bibliography of recent books of travel in English has been added by the editor, Gilbert H. Grosvenor. (Washington, D. C.: National Geographic Society.)

"Monte Cristo" is not our favorite among the Dumas novels, but it belongs, no doubt, in the Everyman's Library (E. P. Dutton & Co.), where it has been preceded by "The Black Tulip," "Marguerite de Valois," and the Musketeer romances. The "Monte Cristo" is here squeezed into two volumes, of between five and six hundred pages each. This means that the paper used is far from opaque. There is the same general criticism to pass upon Prescott's "Conquest of Mexico," similarly published in two volumes; though here it is not the thinness so much as the mere inferiority of the paper which is to be complained of. Thomas Seccombe contributes a short introduction to the first of these volumes. It is a pleasure to note that other additions to this really excellent series of reprints are above criticism of the kind applicable to the Dumas and Prescott. Thus the page of "The Bayard of India: A Life of General Sir James Outram," by Capt. Lionel J. Trotter, is a pleasing one; although, of course, the economy which is a prominent consideration in this series narrows the margins somewhat more than would be desirable were economy to be left out of account. India seems to be a favorite subject nowadays with the Everyman publishers; they are reprinting also George Smith's "William Carey: Shoemaker and Missionary"—the biography of "the first of her own children of the Reformation whom England sent forth as a missionary to India."

The Messrs. Dutton advertise, also, that two courses of systematic reading, founded on the texts which they publish in this library, and prepared by H. W. Mabie, are now ready, while others are to be announced at an early date. The first of these courses is described as "The Heart of Everyman's Library," and is based on a selection of books which, to quote Mr. Mabie, "contain the richest substance of thought and feeling, the deepest experience, and the most radiant vitality interpreted and expressed by the most original and penetrating artistic genius." The other course, "Books of Pleasant Reading," concerns itself with a shorter list. One learns, too, that the diverting introductions contributed by Mr. Chesterton to the Everyman's Dickens are to be collected and published in a single volume.

Professor Gildersleeve's University of Virginia lectures, "Hellas and Hesperia: or the Vitality of Greek Studies in America" (Holt), inevitably suggest comparison

with Professor Butcher's "Harvard Lectures on Greek Subjects" and the late Sir Richard Jebb's Turnbull lectures on Greek poetry at Johns Hopkins. It is disappointing to find that they do not stand the comparison. They consist chiefly of personal reminiscences, and of desultory remarks upon anything within or without the field of Greek studies. It is interesting, of course, to learn that Professor Gildersleeve is responsible for the term "bolometer," which he created at the request of the late Professor Langley, and for the suggestion of "aërodrome," which he found in Lucian. Even so, and notwithstanding the fact that these discourses are enlivened by the lecturer's jests upon grammarians, by his exposure of translators' inadequacy, and by his not too profound comparison of the Greek and the American character, they seem, on the whole, hardly to present the "fresh aspect" of the subject which the terms of the foundation lead the reader to look for; nor do they possess as a series the unity that under these terms would entitle them to publication in book form. This criticism Professor Gildersleeve anticipates, but does not disarm.

The character and career of the Emperor Akbar the Great have excited the interest and admiration of more than one English writer on East India. Fuller, however, than the accounts of him given by Sir M. H. Elliot, in his "History of India," or by Stanley Lane-Poole in "Mediæval India," is the biography by the professor of Indology in the University of Tübingen, Dr. Richard Garbe, under the title: "Kaiser Akbar von Indien: Ein Lebens- und Kulturbild aus dem sechszehnten Jahrhundert" (Leipzig: Hassel). Professor Garbe's small volume contains a faithful record of the life of this enlightened ruler.

"The Jena Campaign," by Col. Maude (The Macmillan Co.), is an unusual book that should attract readers from a wider circle than the special students of military history to whom it is addressed. For Jena, as the author rightly holds, marks the point at which the French Revolution imposed on Europe the theory of the loosely trained armed nation, which at the present day lies, with other factors, at the back of the Pacifist movement. But was Europe right? Did not the Prussian battalions really demonstrate that the small army of highly trained long-service soldiers is superior to the loosely trained mass? That is the author's thesis; and without forcing us to agree with his extreme conclusions, he proves the case, as have most of his predecessors from Klausewitz to de Bonnal, that it was only in the higher command that the Prussians really failed. While disagreeing with many of the author's historical generalizations, and with a few of his details, we can praise his volume highly for its grasp of the military facts, and for its suggestiveness. The only serious criticism to which he is open on his subject proper is that he does not ascribe to the movements of St. Hilaire nearly enough importance.

The Hartford Theological Seminary celebrated its seventy-fifth anniversary last May, and in recognition of the event the trustees directed the preparation of a volume on "Recent Christian Progress," to consist of essays in all departments of Christian thought and work by men connected in one way or another with the institution. The book contains over fifty chapters in the various fields of Christian theology, biblical criticism, church work, and missions. As a whole, it evidences the important services rendered by the graduates of the seminary. Professor Lewis Bayles Paton is the editor. (The Macmillan Co.)

A new addition to that magnificent *Sammelwerk* entitled "Die Kultur der Gegenwart, ihre Entwicklung und ihre Ziele," edited by Prof. Paul Hinneberg and published by B. G. Teubner of Leipzig and Berlin (price, 14 marks), is a solid tome of nearly six hundred pages, entitled "Allgemeine Geschichte der Philosophie," and is probably the most comprehensive work of the kind in existence. It is the joint product of eight authoritative savants. The introduction, dealing with the beginnings of philosophy and the philosophy of the primitive peoples, is from the pen of Prof. Wilhelm Wündt. Part i, "Die Indische Philosophie," is the work of Prof. Hermann Oldenberg; Part ii, "Islamic and Jewish Philosophy," by Ignaz Goldziher, discusses the influence of this thought on the scholastic writers of the Middle Ages; Part iii, "The Philosophy of China," by Dr. Wilhelm Grube, contains an unusual amount of new and hitherto inaccessible matter; Part iv, "The Philosophy of Japan," by Tetsujiro Inouye, can naturally claim unusual interest; Part v, discussing the philosophy of the Europe of antiquity, is by Dr. Hans von Arnim; Part vi, which treats of European philosophy in the Middle Ages, is by Prof. Clemens Bäumker, and the seventh and final part is a discussion of modern philosophy by Dr. Wilhelm Winderbrand. Each part is subdivided into four or more heads, and has a bibliography. It would be hard to get more solid information and suggestive data to the square inch than is found in this new history of philosophy.

A new edition of the "Tristan und Isolde" of Gottfried von Strassburg, prepared by Wilhelm Hertz, has just been issued by J. G. Cotta of Stuttgart. It is critical and carefully edited, with a *Nachwort* by Friedrich von der Leyen.

Few long articles fall within the nineteenth volume of Meyers Grosses Konversations-Lexicon, from "Sternberg" to "Vestor." The longest is the one on the Turkish empire, which here falls a victim to the slow process of encyclopædia making and appears as still an absolute monarchy with its history brought up to only 1906. The wild animal trade (*Tierhandel*) receives brief but interesting comment. Robert Louis Stevenson is credited with the authorship of "The Treasure Island," but "Kidnapped" is omitted. Richard Strauss is sharply set down as lacking the melodic gift. Burial (*Totenbestattung*) carries a number of rather uncommon illustrations. There is an error in the short notice on the London *Times*. That journal is now under the management, not of Mr. C. A. Pearson, but of one of the Walters. "Tunnels" has a sketch map of New York's subterranean network, but not all our river tubes are shown. In the list of high towers (*Turin*) we miss the Singer tower, which should come in second place after the Eiffel, the Metropolitan's aspiring minaret being too new for inclusion.

Science.

Snake Venoms. By Dr. Hideyo Noguchi. Publication No. 111. Washington: The Carnegie Institution.

Dr. Noguchi, whose studies were begun under Dr. S. Weir Mitchell, but completed at the Rockefeller Institute in New York under Dr. Flexner, now embodies his researches in an elaborate monograph of over 300 pages, with many illustrations in sepia and in colors. Although he makes special reference to the phenomena of the venom itself, yet his field is really much broader. The first fifty pages are devoted to a descriptive and systematic morphological and a distributional account of the poisonous snakes of the world, more than 300 forms being enumerated, followed by a description of the poison apparatus. In a short chapter on the phylogeny of poisonous snakes, Dr. Noguchi states that the poison gland was probably the first of the specialized structures to appear, while the elaborate, erectile, grooved fangs were of later development. The poison gland "is equivalent to, if not identical with, the parotid of the mammalia." The remainder of the work is given up to a consideration of the venom itself. We find chapters on its physical and chemical properties; symptoms of venom poisoning in man and in lower animals; and on the organism as a whole and upon specific organs and tissues, this latter subject being more fully treated than any other.

There follow chapters on artificial and natural immunity, with a most interesting but altogether technical discussion of antivenins. The final and thirtieth chapter is headed Treatment of Snake Bites. Here we have a careful review of the various so-called antidotes with a scientific testing of their value. The author concludes that ammonia and alcohol are absolutely harmful in critical cases, their only value being where the person was not fatally bitten. Sucking the wound is entirely useless. The treatment advocated is to ligature the bitten part at once with a tourniquet of cloth or rubber, and to inject locally a one per cent. solution of potassium permanganate. If an antivenin is at hand, injections should be made both intravenously and locally. These serums are now prepared at institutions in India, Australia, Brazil, Tokio, and at the Rockefeller Institute in New York. When the amount of venom introduced into the bite is very large, nothing avails to prevent death, but the above treatment proves efficient in the great majority of what otherwise would prove fatal cases.

The monograph ends with a bibliography of about 400 titles, and a well-made index. The lack of summaries in

the various chapters is a drawback to easy reference. In these days of vast output of scientific treatises, when one man can hardly cover the field even of his chosen specialty, such a lack is most annoying. In every case, where several hundred facts are stated concerning some character or characteristic of the venom, there should be a brief summing up of the knowledge which these facts give.

A dispatch from Vienna states that the Austrian government will place upon the market a portion of the 154 grains of radium chloride, produced by the St. Joachimthal (Bohemia) plant. After the Vienna hospitals and scientific institutions have been supplied, free of cost, the remainder is to be offered for sale at $75,000 per gramme.

Prof. S. W. Williston of the department of palæontology at the University of Chicago has unearthed fossils or skeletons of reptiles and mammalia attributed to the hardly imaginable period of fifteen million years ago. An expedition of the Chicago institution commenced the excavations which led to these discoveries, last summer, in northwestern Texas, north of the Wichita River. Animal forms deposited in the clay as far back as the Palæozoic Age were here uncovered. The skeletons of the animals that died in what was then a river delta became covered with mud and detritus which, century after century, increased in depth. Later, the surface of the earth in this region underwent an upheaval; and this was followed by the triturating effects of winds and rains, which finally brought the surface of the earth down again to the point at which these bodies lay. Minute work is now being given by Professor Williston and his assistants to the placing together and the reconstruction of amphibia of which science has heretofore had no knowledge, but which prove connecting links between the classification of species heretofore established.

The Anglo-Egyptian government of the Sudan, realizing that it is impossible to educate and govern a people without a knowledge of their customs, ideals, unwritten laws and usages, has determined to make an anthropological survey of the country. Dr. and Mrs. C. G. Seligmann, who have just completed a similar work in Ceylon, have been chosen to conduct these investigations, and leave England this month for the Sudan. Their first work will be with the Dinkas and Shilluks in the Upper Nile Province, and then probably they will study the Nubas of Southern Kordofan. An anthropometrical survey is also contemplated.

George W. Hill of Columbia University has received the Copley medal of the Royal Astronomical Society of England, for researches in astronomy. In 1887 a gold medal was awarded to him by the same society, and he also received the Damoiseau prize of the Paris Académie des Sciences for researches in celestial mechanics.

The death of Dr. C. Gottsche, director of the Hamburg Geological Institute, is announced.

Dr. Theodore Ruggles Tinby, inventor of the revolving turret used on the Monitor in the civil war, died November 9 in Brooklyn, at the age of ninety-one years. He was the author of "Beyond," "Stellar Worlds," "Lighted Lore for Gentle Folk," and the inventor of the floating dry dock (1836), the American turbine water-wheel or motor (1844), and of the first commercially portable 33-inch mercurial barometer (1857). From 1861 to 1891 he frequently patented devices for coast defence, and his seems to have been the first wholly practicable method for raising sunken vessels (1841).

John R. Moffitt, inventor of the modern threshing machine (1851), died at Denver, Colorado, November 15, aged eighty-four years.

Drama.

"The Cottage in the Air," the modern comedy by Edward Knoblauch, which was the second production of the New Theatre, proved to be an adaptation of "Priscilla's Fortnight," a tale by the Baroness von Arnin, author of "Elizabeth and Her German Garden." It describes the escapade of a minor German princess, who, rather than marry the princely husband prescribed by parental authority, makes a secret flight to England in the company of her old tutor—an amiable idealist who has expatiated to her upon the hollow mockeries of royal pomp and the joys of a simple, free, and altruistic life. She hopes to rusticate, incognita, in some village Eden and find true happiness in ministering to the poor. She discovers her ideal spot and proceeds to play the part of lady bountiful with disastrous results. By her indiscreet benefactions she quickly demoralizes the whole laboring community, and hopelessly antagonizes the local dignitaries, represented chiefly by a feeble parson and his formidable wife. Moreover, she soon becomes the object of most uncharitable suspicion, and—after her ready money has all gone—the helpless victim of infuriated creditors. Even the chivalrous but somewhat foolish young squire, who has gallantly offered her his heart and hand, doubts her honesty when she says that her position will not permit her to accept his offer. Broken-hearted at the utter failure of her experiment she is compelled to confess the truth to the lad's mother, who accords her sympathy, but insists that her conduct has been wholly inconsiderate and selfish. So it comes to pass that the poor princess, disillusioned and humiliated, is glad to welcome her affianced prince—who is really very fond of her and has tracked her to her retreat—and willingly consents to assume the royal and matrimonial yoke which she had sought to avoid.

This pretty little old-fashioned fairy story, although it undoubtedly contains elements of popularity, is somewhat unsubstantial dramatic stuff to occupy so prominent a place in the New Theatre programme. But it furnishes agreeable entertainment, is wholesome, fairly interesting—though by no means absorbing—and is not deficient in either humor, albeit of a conventional order, or characterization. Many of the personages are cleverly and truly drawn, the adapter having executed his task with nice discretion. The sketch of the bibulous, blustering, and dunderheaded Grand Duke is capital and was vitally personified by Mr. Louis Calvert. Admirable, too, is the study of the tenderhearted and scholarly old idealist, Herr Fritzing, the princess's tutor, very well played by Albert Bruning. The princess, also, is an attractive and living piece of womanhood, in whose portrayal Miss Olive Wyndham was only partly successful. She failed to realize the embarrassment of royalty in utterly strange conditions, and so missed many humorous opportunities. All the English types are veracious and were notably well acted. Mrs. Sol Smith enacted a hypocritical old pauper with skilful realism and unexaggerated humor, while Mr. Cecil Yapp and Miss Beverly Sitgreaves presented the parson and his wife in convincing fashion. Miss Rose Coghlan, as a kindly woman of the world, gave life and color to a conventional sketch by her finished and authoritative style, and Mr. Ferdinand Gottschalk played her simple, impressionable son with his usual neatness and intelligence. Considered as a whole, the representation was distinctly good in its smoothness and level excellence, while the stage management was admirable. The achievement, in short, though in no way specially remarkable, was altogether creditable to the new organization, which is evidently well equipped for the lighter forms of comedy, however deficient it may be in some of the requirements of poetic tragedy. A test of its capacity in the stronger forms of modern drama will be afforded in its forthcoming presentation of Mr. Galsworthy's "Strife." It is far too soon yet to attempt any forecast of the possibilities of its future, but it may be said confidently that its second experiment supplies firmer ground for hopeful expectation than did its first.

England is to retain its censor of plays, though the reports do not make it clear whether the judicious Mr. Redford is to wield powers unshorn or whether the absolute prohibition of a play is to be replaced by a warning from the censor that police prosecution may follow its production. At the same time, music-halls, now exempt, are to be placed under the authority of the censor. This is a peculiar result of the campaign waged for the suppression of the censorship. Under that system, it was argued, serious plays of the realistic sort came under the ban, while the indecencies of the vaudeville stage flourished unchecked. The Parliamentary investigating committee, after taking a good deal of testimony, seems to have gravely decided that, yes, the music-hall does enjoy greater liberty than the legitimate stage, so we had better put music-halls, too, under the man with the blue pencil. The testimony given before the committee by England's most eminent men of letters was by no means so hostile to the censorship as we have been led to imagine. The necessity of a change in the present system most of the witnesses insisted upon. The censor's decisions were arbitrary and erratic, and it was hinted that Mr. Redford, for all his estimable qualities as a gentleman, was in the matter of literary equipment only so-so. But it also appeared that some sort of licensing system for the theatre was called for by public opinion, and the agile

Mr. Chesterton went so far as to say he should not object to the Municipal Council passing on the eligibility of a play.

The late John Davidson left a written request that all persons happening to possess copies of certain plays and adaptations of his making should destroy them, and that these pieces should never be produced; the titles of the plays being as follows: "Queen Fiammetta," "The Children of the King," "Fanny Le Grand," "Phèdre," "Lancelot," "The Game of Life."

R. L. Stevenson's story, "The Suicide Club," which has been produced with grisly effect at the Grand-Guignol in Paris, under the title "Les Nuits du Hampton's Club," and was acted by that company on its English tour of season before last, is in process of dramatization for English production by Seymour Hicks.

The London Afternoon Theatre began its season at His Majesty's Theatre on November 11. A two-act opera by Joseph Holbrooke, with a libretto by W. E. Grogan, "Pierrot and Pierrette," was produced, as also J. M. Synge's Irish comedy, "The Tinker's Wedding."

M. Antoine promises for production at the Odéon this season a dramatization of "David Copperfield," by Max Maurey. Other pieces announced are an adaptation by André de Lorde, from Guy de Maupassant; an historical play by Maurice Donnay of the Academy; "Parrain," a four-act play by Pierre Veber; "L'Impasse," a five-act piece by Emile and Philippe Moreau; "L'Ornière," by Charles Desfontaines, and "Reines de rois," by Léon Hennique and Johannes Gravier.

Music.

OPERATIC EXTENSION

Beginning last Monday, and continuing five months, New York will have fifteen or sixteen operatic performances a week. Not many years ago one company singing five times a week was found quite enough, sometimes more than enough. When Oscar Hammerstein built the Manhattan Opera House there were few who believed that he would be able to hold his own for even one season against the millionaires who control the Metropolitan Opera House. Last week he entered his fourth season with brighter prospects than ever. Some of his achievements have even had their influence on the production of opera abroad, and they have done much toward stimulating that general interest in opera throughout this country which is one of the most notable phenomena of the day.

Observers of musical conditions in this country have long considered it anomalous that, whereas in Italy, Germany, and France every large city has a long opera season, nearly always by a local company, American cities, including some numbering over a million inhabitants, have hitherto been content to take their annual allowance of opera in a festival lasting a week or two, during which so much is offered that the feast degenerates into a gorge. As many music-lovers persistently refused to patronize such performances, the impression was created that the American public, outside of the metropolis, which is semi-foreign, did not care for grand opera. Obviously, there was something wrong about this conclusion. Is not opera everywhere more popular than concerts and do not concerts flourish surprisingly in American cities? The great European artists come over here for their most abundant harvests; the operatic prima-donnas earn even more by giving recitals than they do at the Metropolitan and Manhattan; and a number of cities, among them Philadelphia, Boston, Pittsburgh, Chicago, St. Louis, Cincinnati, Washington, St. Paul, Milwaukee, San Francisco, Los Angeles, and Seattle, have permanent orchestras of their own. Is it not a foregone conclusion that opera, because of its more direct appeal not only to the masses but to those who have most money to spend, will flourish in our cities if homes are built for it and local companies installed?

Philadelphia always seemed to have as much opera as it cared for while it got one performance a week from our Metropolitan singers. When Mr. Hammerstein built his opera house in that city, those who believed he was doing an unwise thing were again in the majority, but they were mistaken. The appetite for opera grows as it is catered to. Two weeks ago the Philadelphia season was opened by the performance of the same opera—"Aïda"—by both the New York companies; and both the houses were filled to their capacity. In its dependence on borrowed companies, Philadelphia is behind Boston, which has achieved the distinction of having an opera house and a company of its own—our only non-metropolitan city, if we except New Orleans with its French company, of which this can be said. The eagerness with which Boston took up the project of having a real opera house and home-made opera is indeed quite amazing. Although it was understood from the beginning that more reliance would be placed on good ensemble than on the engagement of "stars," all of the boxes and the parquet seats were taken for three seasons before the first had begun! To satisfy the demand Mr. Russell actually had to enlarge his scheme by adding Thursday and Saturday to the opera nights. Besides its fifteen weeks of home-made opera, Boston will also have two weeks of German opera by our Metropolitan artists and two by the French and Italian singers at the Manhattan, so that her season will fall only a week short of ours.

Details regarding their scheme of operatic expansion have been furnished recently by MM. Gatti-Casazza and Dippel. The Boston company is affiliated with our Metropolitan, which lent Mmes. Nordica and Homer for the opening night and will help on other occasions, getting the occasional services of Boston singers in return. This is only one of many arms which the Broadway octopus is stretching out in all directions. Another one takes in Atlanta, the inhabitants of which, though numbering only 150,000, have engaged the Metropolitan forces for a whole week next May. The guarantee called for was subscribed in one day and a completely equipped stage is to be made ready. St. Louis, which formerly did not seem to care for opera, has begged to be included in the next spring tour. Baltimore is to be favored with a series of weekly performances instead of a festival. In Chicago Mr. Dippel has rescued the Auditorium from the low level to which it had sunk, and it is to be once more the home of grand opera. Seidl, Nordica, De Reszke, and the other Grau artists used to look forward to the Chicago visits on account of the Auditorium's excellent acoustic qualities, which are now duplicated in Boston's new opera house.

It is Mr. Dippel's intention gradually to take all our leading cities into his circuit, and thus to extend the opera season from five months to nine. Chicago is to have its own company, affiliated, like that of Boston, with the Broadway house; and other cities, it is expected, will soon follow these examples. But the most extraordinary aspect of this policy of extension is the inclusion of Paris, which is to be visited next spring for a series of Italian evenings which, with Caruso, cannot fail to be successful. Nor can there be any doubt as to the outcome of the German nights to be given there the following year, for the Parisians, though they are Wagner enthusiasts, have seldom if ever heard his works as well given as they are here. Mr. Hammerstein also has engaged a Parisian theatre for a series of French performances. He will not be carrying coals to Newcastle, but simply cause the best Parisian singers, nearly all of whom he has, to return for a visit to the scene of their former triumphs.

It is because our American managers have corralled nearly all of the world's greatest artists that they can thus enlarge their plans to international dimensions. Various advantages will result, so far as America is concerned. Heretofore American students have been compelled to go abroad because in Germany and Italy alone there are a sufficient number of opera houses to offer them a start. As our own buildings multiply, this will no longer be necessary. American composers are more likely to get the encouragement they deserve; and as for foreign composers, they are already looking to America as the best

place for producing novelties, because we have the best singers. Puccini is writing his new opera, "The Girl of the Golden West," for the Metropolitan, and Humperdinck will soon cross the Atlantic to let us enjoy his "Children of the King" before even the Germans have heard it. New York is destined to become, operatically, what Paris was in the days of Meyerbeer.

Quite unexpectedly, in view of rumors that had been circulated, the acoustic properties of the New Theatre proved to be not only tolerable, but exceptionally good for operatic performances. The test was made on Tuesday night with Massenet's "Werther." The strings and woodwind had a delicious sound, while the brass actually came out too loud in some places. Two previous attempts are on record to float this opera, but they were made in the Metropolitan, the vast spaces of which proved fatal to its delicate charms, even though the cast included Jean de Reszke and Emma Eames. In the New Theatre, the opera is sung by Geraldine Farrar, who presents some lovely pictures in it; the popular French tenor, M. Clément; beside Miss Gluck and M. Dinh Gilly, all of whom made successful débuts. "Werther" has at last found its proper surroundings, and, judging by its reception, it is likely to succeed at last.

In the days of Hans von Bülow the Russian music of the period was regarded as the limit of the allowable in the matter of dissonance and general defiance of the conventional. The trouble with those composers was that they had little to offer besides dissonance and defiance, and so their works have been consigned to oblivion. The men who survived were the melodists, Tchaikovsky, Rubinstein, and Rimsky-Korsakoff, whom the cacophonists scorned. At the present day no composer is more prominent in Russia than Sergei Vassilievich Rachmaninoff, who made his New York début on Saturday afternoon by playing his second pianoforte concerto with the Boston Symphony Orchestra. It is well known that Brahms owed the beginning of his fame to the Hungarian dances he had arranged and published. Rachmaninoff, similarly, might have remained unknown to the general public had it not been for a prelude which became a "best seller," and, strange to say, deserved all the vogue it got, for it is good music. His concerto had been played here before more than once, but he showed that there is more in it than had previously been suspected. It is a pleasure to add that he is not a cacophonist; Russia has apparently recovered from that disease.

From Rome we learn of the presentation, at no remote date, of the new operetta by Ruggiero Leoncavallo, which is called "Malbrouk," and the libretto of which is by Maurice Vaucaire. The opera will be offered this season to the German as well as to the Italian public. Its subject is allegorical, and it is said that the hero has nothing in common with the Malbrouk of the old French song. Signor Leoncavallo's Marlborough is derived, rather, from Boccaccio, and from such analyses of the piece as are available, one gathers the impression that the new opera is of the merriest.

Ludwig Schytter, the Danish composer, has died in Vienna, his place of residence in recent years, in his sixtieth year. His songs and compositions for pianoforte number about 110, and he wrote also a one-act opera, "Hero" (1898), and a comic opera.

News comes of the death of Nicolo Spinelli, winner of the second prize in the Sonzogno competition of 1890, when Mascagni won the first with "Cavalleria Rusticana." A later opera, "A Basso Porto," has been successfully produced in Italy, as also in Germany and at London.

Art.

THE BOSTON ART MUSEUM.

On Monday the Boston Museum of Fine Arts opened its new building to the public. It is the first structure of the sort that has taken into account the remoter growth of the collections it houses, and it is, as well, the first museum that makes a logical division between display and storage of its treasures. Though it has two and a half times the floor area of the abandoned building in Copley Square, it is still but a scant half of the greater museum that it is to be. The façade expresses clearly the double function suggested above. A well-lighted lower story is largely given up to administration, study rooms, and objects in storage exhibition; the higher upper story is devoted to exhibition galleries containing the objects of most general value and appeal.

This scheme has imposed difficult conditions upon the architect, Guy Lowell, and his advisory committee, Messrs. E. M. Wheelwright, D. Despradelle, and R. G. Sturgis. It was a question of a front 500 feet long with a height of only some forty feet. The trustees had determined to avoid that excessive height which, affording monumental opportunities to the architect of a museum, imposes in bad lighting and ill-proportioned gallery walls, a permanent discomfort upon the visitor. The lower story also must be generously pierced for light, and could not serve merely as a base. The architect frankly accepted the situation and carried the second-story windows down to the string moulding by brackets—or one might say a false balcony—thus making the lower windows a kind of sash for the more ornate upper opening and thereby gaining, with a vertical motive, a sense of height. Again, the squatness of the front is dissimulated by bringing the wings forward 120 feet towards Huntington Avenue, and providing both them and the central entrance with slender Ionic porticos. By proper landscape gardening of the vast forecourt thus inclosed—and this, naturally, will take time—the building will gain in seclusion and dignity.

It has seemed well to go rather fully into this matter of plan, because on no other basis can the merits of the building be appreciated. The design is absolutely a structural one, being directed throughout by the inner requirements. Great ingenuity has been shown in drawing architectural profit from the cramping conditions. What is even more remarkable in the whole thing is the fidelity with which the architect has applied his science and taste to the essential matter in hand. He has caught the spirit of the Museum, and has expressed it for all time. When one thinks of the specious libraries that are put up irrespective of the service they must render, of museums that belittle and crush the beautiful objects they contain, one is tempted to require a monument for Mr. Guy Lowell and his associates.
